#### Abstract

Bioassay-guided fractionation of an extract of a marine sponge, Stelletta sp., has led to the isolation and characterization of four new cytotoxic isomalabaricane triterpenes, named stellettins C (1), D (2), E (3), and F (4). Three known triterpenes (5-7) were also isolated from the same extract. The most sensitive of the tested cell lines (e.g., leukemia, central nervous system, renal) generally responded with $\mathrm{GI}_{50}$ concentrations in the low-to-mid nanomolar range.

Fractionation of the crude extract of a marine sponge, Stelletta sp., guided by the National Cancer Institute's (NCI) 60 human tumor cell line in vitro assay, ${ }^{2-4}$ has led to the isolation and characterization of four new cytotoxic isomalabaricane triterpenes, named stellettins $^{5} \mathrm{C}(\mathbf{1}), \mathrm{D}(\mathbf{2}), \mathrm{E}(\mathbf{3}), \mathrm{F}(\mathbf{4})$, and three known triterpenes, stellettins A and $\mathrm{B}\left(\mathbf{5}^{10}\right.$ and $\mathbf{6}^{7}$ ), and 7, ${ }^{7}$ which we propose to call stellettin G. Natural products possessing the isomalabaricane skeleton are relatively rare, and only a handful of these compounds have been identified from marine organisms. ${ }^{6-13}$ There have been several reports of secondary metabolites from the genus Stelletta, including triterpenes, $8,11,14$ steroids, ${ }^{14}$ and alkaloids. ${ }^{15-16}$

## Results and Discussion

The organic extract of a Steletta sp. collected in northern Australia was subjected to solvent-solvent partitioning to yield a cytotoxic $\mathrm{CCl}_{4}$ fraction. After vacuum-liquid chromatography on Si gel, HPLC of the less polar, cytotoxic fractions gave stellettins A (5), B (6), C (1), and D (2). Purification of the more polar fraction by $\mathrm{C}_{18}$ HPLC gave a mixture of 3, 4, and 7, which was separated after methylation to afford 8-10. Stellettins C and D ( $\mathbf{1}$ and $\mathbf{2}$ ) and all the other pairs of geometric isomers could be separated and purified by HPLC, but each compound rapidly equilibrated to a mixture of geometric isomers upon exposure to light.

HRFABMS of $\mathbf{1}$ established a molecular formula of $\mathrm{C}_{32} \mathrm{H}_{42} \mathrm{O}_{5}$, and UV absorptions at 417 and 395 nm suggested the presence of a highly conjugated system. The ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectrum indicated the presence of a ketone ( $\delta$ 206.2), an ester ( $\delta$ 170.0), and four double bonds (eight resonances between $\delta 120$ and 150). The ${ }^{1}$ H-NMR spectrum of $\mathbf{1}$ contained signals for eight methyl groups and five olefinic protons. A prominent ${ }^{1} \mathrm{H}$-NMR resonance at $\delta 4.71$ correlated with a ${ }^{13} \mathrm{C}$-NMR signal at $\delta 80.7$ (HMQC) and clearly indicated an oxygen-bearing methine. HMBC correlations between a methyl singlet ( $\delta 1.76$ ) and the ester carbonyl ( $\delta 170.0$ ) and between $\delta 4.71$ and the same carbonyl ( $\delta 170.0$ ) implied an acetate ester. A COSY experiment established the connectivity of three ol efinic protons ( $\delta 6.87$, $6.92,7.48$ ), and their coupling constants allowed the assignment of the double bond geometries to give

[^0]

$2 R=O A c, R_{1}=H$
$6 \mathrm{R}, \mathrm{R}_{1}=\mathrm{O}$

fragment A. The remaining two ol efinic protons ( $\delta 6.23$, 5.46) were coupled to each other, and the proton at $\delta$ 6.23 had a long-range coupling ( $J=1.2 \mathrm{~Hz}$ ) to the methyl group at $\delta 1.89$. The long-range heteronuclear correlations (HMBC) between pairs $\delta 5.46(\mathrm{H} 23)$ and $\delta$ 158.7 (C22), $\delta 6.23$ (H24) and $\delta 158.7$ (C22), $\delta 6.23$ (H24) and $\delta 161.8$ (C26), combined with analyses of the carbon chemi cal shifts, strongly suggested the $\alpha$-pyrone partial structure B. Fragments A and B were connected at quaternary carbons C 20 and C 22 by HMBC correlations to H 17 and H 23 . Because all the $\mathrm{sp}^{2}$ carbons were now accounted for, the remaining part of the structure had

to be tricyclic. A series of NMR experiments, including COSY, HMQC, HMBC, and 1D proton decoupling, was used to define the tricyclic structure and its attachment to fragment $\mathbf{A}$ at C14, thus completing the gross structure of stellettin C (1).

A

B

The relative stereochemistry of $\mathbf{1}$ was determined by difference NOE experiments (Table 1). NOE enhancements observed for the pairs H $18 / \mathrm{H} 16, \mathrm{H} 16 / \mathrm{H} 21, \mathrm{H} 30 /$ H 15 , and $\mathrm{H} 15 / \mathrm{H} 17$ firmly established the all-E configuration of the 13,15,17-triene system. As for the ring junctions of the tricyclic fragment, key NOE effects observed between $\mathrm{H} 19 / \mathrm{H} 29, \mathrm{H} 5 / \mathrm{H} 28, \mathrm{H} 19 / \mathrm{H} 9$, and $\mathrm{H} 5 /$ H30 suggested a trans-syn-trans stereochemistry, consistent with an isomalabaricane skeleton. Irradiation of H3 led to NOE enhancements of H 28 and H 5 , indicating that H 3 was cis to H 5 .
The structures of compounds 2-10 were determined mainly from comparison of the ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ data with those of $\mathbf{1}$ (Tables 2 and 3 ); relative stereochemistry was defined by NOE experiments for all compounds. Compound $\mathbf{2}$ has a molecular formula of $\mathrm{C}_{32} \mathrm{H}_{42} \mathrm{O}_{5}$ and was, therefore, an isomer of $\mathbf{1}$. Both the ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}$ NMR spectra of $\mathbf{2}$ shared many of the same characteristics with the spectra of $\mathbf{1}$. The most striking difference was the presence of a proton resonance at $\delta 8.86$ in $\mathbf{2}$ (in $\mathrm{C}_{6} \mathrm{D}_{6}$ ) in place of the proton at $\delta 6.87(\mathrm{H} 15)$ in $\mathbf{1}$.

This large downfield shift suggested that this proton lay in the deshiel ding zone of the C12 carbonyl group. This would be possible if the C13-C14 double bond were to adopt the (Z)-orientation in $\mathbf{2}$. This hypothesis was further supported by a change in the H 18 chemical shift from $\delta 2.59$ in $\mathbf{1}$ to $\delta 1.77$ in $\mathbf{2}$. An observed NOE between H 18 and H 30 and the absence of an NOE between H 15 and H30 confirmed this assignment. Assignment of the relative stereochemistry of $\mathbf{2}$ was confirmed by NOE difference experiments.

HRFABMS revealed that 5 and 6 have the same molecular formula $\left(\mathrm{C}_{30} \mathrm{H}_{38} \mathrm{O}_{4}\right)$. Examination of the H 18 and H 15 resonances suggested that the two compounds were geometric isomers of the $\Delta^{13}$ olefin. The mass difference of 44 Daltons ( $\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{O}$ ) between 5 and $\mathbf{1}$ suggested replacement of the acetate by a ketone. This was supported by the di sappearance of NMR signals at $\delta 4.7$ (1H) and $\delta 80.7, \delta 170.0$ and $\delta 20.8\left({ }^{13} \mathrm{C}\right)$ in the spectra of $\mathbf{5}$, stellettin $A$. The appearance of a new carbon resonance at $\delta 216.5$ in $\mathbf{5}$ signaled a new ketone carbonyl at C3. The tricyclic ring junction was confirmed, as before, by difference NOE experiments. Stellettin B (6) was determined to be the 13(Z)-isomer of 5 and was previously known, having been characterized primarily by X-ray diffraction. ${ }^{7}$ Shortly after this work was completed, a paper describing the isolation of stellettin A (5) was published. ${ }^{10}$ However, we report here the first full spectral assignments for both compounds.

Compounds 3, 4, and $\mathbf{7}$ proved difficult to separate. The IR spectrum of the mixture showed strong absorptions at 1700 and $1683 \mathrm{~cm}^{-1}$, along with a broad band at $3000-3500 \mathrm{~cm}^{-1}$, indicating the presence of a carboxylic acid group. Final purification of $\mathbf{7}$ was accomplished via preparative TLC. Treatment of the mixture with diazomethane allowed purification of the methyl esters $\mathbf{8 - 1 0}$, derived from $\mathbf{3}, \mathbf{4}$, and $\mathbf{7}$, respectively. All three esters have the same molecular formula, $\mathrm{C}_{31} \mathrm{H}_{42} \mathrm{O}_{4}$ (HREIMS). All possessed six olefinic protons, eight methyl groups, and three carbonyl groups. It was apparent from the spectral data that the $\alpha$-pyrone ring was not present in these compounds. A COSY experiment with compound $\mathbf{1 0} \mathrm{in} \mathrm{CDCl}_{3}$ established the connectivity of the olefinic protons; the proton at $\delta 6.97$ (dd, J $=15.1,11.4$ ) was coupled to $\delta 8.10$ and $\delta 6.39(\mathrm{~d}$, $\mathrm{J}=11.4$ ), and the proton at $\delta 7.45(\mathrm{dd}, \mathrm{J}=15.1,11.4)$ was similarly coupled to $\delta 6.46$ and $\delta 6.52$. HMQC and HMBC experiments allowed the full structural assignment of 10. Scalar coupling constants and difference NOE experiments allowed the assignment of the (E)configuration at C15, C17, and C22 and the (Z)configuration at C13 and C24. The downfield shift of H 23 to $\delta 7.45$ indicated that this proton lay in the deshielding region of the ester carbonyl group, consistent with the $24(Z)$ assignment. The stereochemistry of the tricydic core was found to be the same as in 1 and $\mathbf{2}$ by NOE experiments.

It appears that $\mathbf{1 0}$ was previously derived from extracts of the sponge J aspis stellifera, although the originally proposed structure had the malabaricane (trans-anti-trans) skeleton. ${ }^{7}$ Based on the X-ray structure determination of stellettin $B^{5}(6)$ and NMR spectral comparisons, McCabe et al. ${ }^{8}$ suggested that the compounds reported by Ravi et al. ${ }^{7}$ all had the isomalabaricane (trans-syn-trans) stereochemistry in the tricyclic skeleton.

Table 2. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ Data in $\mathrm{C}_{6} \mathrm{D}_{6}(\mathbf{1}, \mathbf{2}, \mathbf{5}, \mathbf{6})$ or in $\mathrm{CDCl}_{3}(\mathbf{9}, \mathbf{1 0})$

Compound 8 was similar to 10, except for chemical shift differences at H 23 ( $\delta 6.55$ ) and H 24 ( $\delta$ 7.27). Difference NOE experiments suggested that $\mathbf{8}$ was the C24 24(E) isomer of $\mathbf{1 0}$. Similarly, $\mathbf{9}$ differed from $\mathbf{1 0}$ at H15 ( $\delta 6.67$ ) and H18 ( $\delta 2.32$ ), a phenomenon
previously observed between $\mathbf{1}$ and $\mathbf{2 , 5}$, and $\mathbf{6}$. Therefore, $\mathbf{9}$ was the $13(\mathrm{E})$ isomer of 10.
Due to the rapid equilibration between 1 and $\mathbf{2 , 5}$, and $\mathbf{6}$, and $\mathbf{4}$ and $\mathbf{7}$, mixtures of each pair of interconverting compounds was tested in the NCI's 60 human tumor cell line in vitro assay. ${ }^{2-4}$ The more sensitive cell lines (e.g., leukemia, CNS, and renal lines) generally responded with $\mathrm{Gl}_{50}$ concentrations in the low-to-mid nanomolar range (data not shown).

The stellettins are similar to the retinoic acid family in that both are highly conjugated isoprenoid carboxylic acid pigments. COMPARE analyses, ${ }^{4}$ however, showed no tangible similarity between the NCI 60 human tumor cell line panel responses to the stellettins and retinoic acid. Moreover, $\mathbf{5}$ and $\mathbf{7}$, each tested at a concentration of $1 \mu \mathrm{M}$, neither induced conformational changes in human retinoic acid (RAR $\alpha$ ) or mouse retinoid $x$ ( $R \times R \alpha$ ) receptors nor antagonized the ability of 9 -cis-retinoic acid to do so, as detected by the differential proteolytic sensitivity assay. ${ }^{17}$

## Experimental Section

Sponge Material and Extraction. The yellow sponge Stelletta sp. (Demospongiae, Choristida, Stellettidae; 1 kg , wet wt) was collected as part of an NCl collection contract by Dr. P. Murphy (AIMS) in the northern territory of Australia off the shore north of Cape Wilberforce at depth of 15 m in November 1990. The sponge (spherical, brown-purple exterior, brownyellow interior) was identified by Dr. S. Pomponi, and a voucher specimen (Q66C4702) was deposited at the Smithsonian Institution.

Isolation. The crude organic extract ( 5.0 g ) was partitioned between $90 \%$ aqueous MeOH and hexane ( 1.55 g ). The MeOH solution was adjusted to $80 \%$ MeOH and extracted with $\mathrm{CCl}_{4}(2.20 \mathrm{~g})$. The aqueous

MeOH phase was adjusted to $70 \% \mathrm{MeOH}$ and further extracted with $\mathrm{CHCl}_{3}(0.50 \mathrm{~g})$. The bulk of the activity was concentrated in the $\mathrm{CCl}_{4}$ fraction, which was subjected to vacuum liquid chromatography on Si gel using EtOAc- $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (0-100\% EtOAc) to yield two active fractions ( 1.025 g and 0.345 g , respectively). HPLC purification of the less polar fraction ( 80 mg ) on a silica column ( $2.1 \times 25 \mathrm{~cm}, 12 \mathrm{~mL} / \mathrm{min}$, EtOAc$\left.\mathrm{CH}_{2} \mathrm{Cl}_{2}, 1: 9\right)$ afforded compounds $\mathbf{1}$ ( 5.1 mg ), $\mathbf{2}$ ( 12.0 mg ), 5 ( 11.9 mg ), and $6(41.0 \mathrm{mg})$. HPLC purification of the more polar fraction ( 55 mg ) on a $\mathrm{C}_{18}$ column ( $2.1 \times 25$ $\mathrm{cm}, 10 \mathrm{~mL} / \mathrm{min}, \mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}, 23: 2$ ) yielded a mixture $(24.2 \mathrm{mg})$ of $\mathbf{3}, 4$, and 7 , part of which ( 5.0 mg ) was treated with excess $\mathrm{CH}_{2} \mathrm{~N}_{2}$ and purified by HPLC (silica, $\left.1 \times 25 \mathrm{~cm}, \mathrm{EtOAc}-\mathrm{CH}_{2} \mathrm{Cl}_{2}, 2: 23\right)$ to afford $\mathbf{8}(0.5 \mathrm{mg}), \mathbf{9}$ $(2.2 \mathrm{mg})$, and 10 ( 1.6 mg ).

Stellettin C (1): a yellow solid; $[\alpha]_{\mathrm{D}}-250^{\circ}$ (c 0.51, $\mathrm{CHCl}_{3}$ ); UV (EtOH) $\lambda \max 418 \mathrm{~nm}$ (log $\epsilon 4.39$ ), 395 (4.48), 313 (4.24); IR (film) $v$ max 3015, 2957, 1710, 1699, 1544, $1246 \mathrm{~cm}^{-1}$; HREIMS m/z 506.3022; calcd for $\mathrm{C}_{32} \mathrm{H}_{42} \mathrm{O}_{5}, 506.3032 ;$ EIMS m/ z 506 (95), 491 (20), 446 (10), 257 (100), 256 (60), 241 (35); for ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}$ NMR in $\mathrm{C}_{6} \mathrm{D}_{6}$, see Tables 1-3.

Stellettin D (2): a yellow solid; $[\alpha]_{\mathrm{D}}-19.4^{\circ}$ (c 1.0, $\mathrm{CHCl}_{3}$ ); UV (EtOH ) $\lambda \max 418 \mathrm{~nm}$ ( $\log \epsilon 4.45$ ), 400 (4.54), 313 (4.23); IR (film) $v \max 3015,2957,1710,1699$, 1544, $1246 \mathrm{~cm}^{-1}$; EIMS m/z 506 (100), 494 (40), 451 (30), 397 (40), 257 (100), 256 (50), 241 (20); HREIMS $\mathrm{m} / \mathrm{z} \mathrm{506.3002;} \mathrm{calcd} \mathrm{for} \mathrm{C}_{32} \mathrm{H}_{42} \mathrm{O}_{5}, 506.3032$; for ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ in $\mathrm{C}_{6} \mathrm{D}_{6}$, see Tables 2 and 3.

Stellettin A (5): a yellow solid; $[\alpha]_{\mathrm{D}}+36.6^{\circ}$ (c 1.23, $\mathrm{CHCl}_{3}$ ); UV (EtOH) $\lambda \max 417 \mathrm{~nm}(\log \epsilon 4.24), 396$ (4.35), 312 (4.03); IR (film) $v$ max 3068, 2958, 1704, 1700, $1544 \mathrm{~cm}^{-1}$; HRFABMS m/ z 462.2772; calcd for $\mathrm{C}_{30} \mathrm{H}_{38} \mathrm{O}_{4}$, 462.2770; EIMS m/ z 462 (100), 447 (30), 429 (10), 313 (100), 257 (80), 256 (70), 241 (40); ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}-$ NMR in $\mathrm{C}_{6} \mathrm{D}_{6}$, see Table 2 and 3 ; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta$ 7.26 (d, J $=11 \mathrm{~Hz}, \mathrm{H}-17$ ), 7.15 (dd, J $=7,1, \mathrm{H}-24$ ), 6.99 (dd, J = 15, 11, H-16), 6.92 (d, J = 15, H-15), 6.23 (d, J $=7, \mathrm{H}-23$ ), 2.74 (ddd, J $=15.5,11.8,5.9, \mathrm{H}-2$ ), 2.43 (dd, $\mathrm{J}=13.2,2, \mathrm{H}-5), 2.36$ (ddd, J = 15.5, 10, 2, H-2), 2.33 (m, 1H ), 2.33 (s, 3H, H-18), 2.22 (br d, J = 11, 2H, H-11), $2.17(\mathrm{~m}, 2 \mathrm{H}), 2.12(\mathrm{~d}, \mathrm{~J}=1,3 \mathrm{H}), 2.03(\mathrm{~d}, \mathrm{~J}=1,3 \mathrm{H})$, 1.86 (t, 11, H-9), 1.65 (br dd, J $=15,11,1 \mathrm{H}), 1.50(\mathrm{~m}$, $2 \mathrm{H}), 1.44(\mathrm{~s}, 3 \mathrm{H}, \mathrm{H}-30), 1.13(\mathrm{~s}, 3 \mathrm{H}, \mathrm{H}-28), 1.05(\mathrm{~s}, 3 \mathrm{H}$, $\mathrm{H}-29$ ), 0.84 (s, 3H, H-19).

Stellettin B (6): a yellow solid; $[\alpha]_{\mathrm{D}}+49.3^{\circ}$ (c 0.28 , $\mathrm{CHCl}_{3}$ ); UV (EtOH) $\lambda \max 417 \mathrm{~nm}(\log \epsilon 4.24), 395$ (4.34), 313 (4.03); IR (film) $v$ max 3068, 2958, 1704, 1700, $1544 \mathrm{~cm}^{-1}$; HREIMS m/ z 462.2780; cal cd for $\mathrm{C}_{30} \mathrm{H}_{38} \mathrm{O}_{4}$, 462.2770; EIMS m/ z 462 (100), 450 (40), 447 (30), 407 (30), 353 (40), 313 (20), 257 (65), 256 (60), 241 (30); ${ }^{1} \mathrm{H}-$ NMR and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ in $\mathrm{C}_{6} \mathrm{D}_{6}$ seeTable 2 and 3 ; ${ }^{1} \mathrm{H}-\mathrm{NMR}$ $\left(\mathrm{CDCl}_{3}\right) \delta 8.24(\mathrm{~d}, \mathrm{~J}=15 \mathrm{~Hz}, \mathrm{H}-15), 7.23(\mathrm{~d}, \mathrm{~J}=11.5$, $\mathrm{H}-17), 7.12$ (dd, J $=6.8,1, \mathrm{H}-24), 6.92$ (dd, J $=15,11.5$, H-16), 6.20 (d, J = 6.8, H-23), 2.7 (ddd, J = 16.1, 11.7, $5.8,1 \mathrm{H}, \mathrm{H}-2), 2.36$ (m, 2H, H-5, H-2), 2.24 (dd, J $=11$, 8.5, 1H), $2.22(\mathrm{~d}, \mathrm{~J}=16, \mathrm{H}-11), 2.16(\mathrm{~m}, 1 \mathrm{H}), 2.10(\mathrm{~d}, \mathrm{~J}$ $=1,3 \mathrm{H}), 2.07(\mathrm{~m}, 2 \mathrm{H}), 2.05(\mathrm{~s}, 3 \mathrm{H}, \mathrm{H}-18), 2.01(\mathrm{~d}, \mathrm{~J}=$ $1,3 \mathrm{H}$ ), 1.86 (dd, J = 14, 8.5, H-9), 1.59 (m, 1H), 1.51 (m, 2H), 1.38 (s, 3H, H-30), 1.09 (s, 3H, H-28), 1.04 (s, $3 \mathrm{H}, \mathrm{H}-29$ ), 0.84 (s, 3H, H-19).

Methyl ester of stellettin $\mathbf{E}$ (8): a yellow solid; $[\alpha]_{D}$ $+36.0^{\circ}$ (c 0.05, $\mathrm{CHCl}_{3}$ ); UV (EtOH) $\lambda$ max 410 nm (log $\epsilon 4.52$ ), 395 (4.56), 294 (4.08); IR (film) $v \max 3068,2953$,

(100), 313 (15), 273 (14), 241 (18); HREIMS m/z 478.3088; calcd for $\mathrm{C}_{31} \mathrm{H}_{42} \mathrm{O}_{4}, 478.3083$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right)$ $\delta 8.13$ (d, J = 15.2, H-15), 7.27 (dd, J = 11, 1.5, H-24), 6.96 (dd, J = 15.2, 11.6, H-16), 6.62 (d, J = 15.1, H-22), 6.55 (dd, J = 15.1, 11, H-23), 6.43 (d, J = 11.6, H-17), 3.78 (s, 3H, OMe), 2.69 (ddd, J $=16.1,12.1,5.9,1 \mathrm{H}$, $\mathrm{H}-2$ ), 2.05 (s, 3H, H-18), 1.98 (br s, $6 \mathrm{H}, \mathrm{H}-21, \mathrm{H}-26$ ), 1.38 (s, 3H, H-30), 1.10 (s, 3H, H-28), 1.04 (s, 3H, H-29), 0.84 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{H}-19$ ); partial ${ }^{13} \mathrm{C}-\mathrm{NMR} \mathrm{(CDCl} 3$, from HMQC) $\delta 143.7$ (C-22), 138.7 (C-24), 135.8 (C-17), 134.5 (C-15), $130.4(\mathrm{C}-16), 124.0(\mathrm{C}-23), 51.7\left(\mathrm{OCH}_{3}\right), 45.2(\mathrm{C}-$ 5), 36.8 (C-11), 31.2 (C-1), 29.2 (C-28), 24.5 (C-30), 23.3 (C-19), 19.3 (C-29), 15.8 (C-18), 12.9 (C-21, C-26).

Methyl ester of stellettin $\mathbf{F}$ (9): a yellow solid; $[\alpha]_{D}$ $-54.4^{\circ}$ (c 0.16, $\mathrm{CHCl}_{3}$ ); UV (EtOH) $\lambda$ max 410 nm (log $\epsilon 4.63$ ), 395 (4.66), 292 (3.66); IR (film) $v$ max 3068, 2953, 1704, 1700, $1579 \mathrm{~cm}^{-1}$; EIMS m/ z 478 (30), 463 (7), 431 (8), 365 (100), 313 (15); HREIMS m/ z 478.3082; calcd for $\mathrm{C}_{31} \mathrm{H}_{42} \mathrm{O}_{4}, 478.3083$; for ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ in $\mathrm{CDCl}_{3}$, see Tables 2 and 3.

Methyl ester of stellettin G (10): a yellow solid; $[\alpha]_{\mathrm{D}}+63.6^{\circ}\left(\mathrm{c} \mathrm{0.22}, \mathrm{CHCl}_{3}\right)$; UV (EtOH) $\lambda \max 415 \mathrm{~nm}$ ( $\log \epsilon 4.53$ ), 395 (4.55), 294 (3.81); IR (film) $v$ max 3068, 2953, 1704, 1700, $1579 \mathrm{~cm}^{-1}$; EIMS m/ z 478 (23), 365 (100), 313 (10), 159 (10); HREIMS m/ z 478.3088; calcd for $\mathrm{C}_{31} \mathrm{H}_{42} \mathrm{O}_{4}, 478.3083$; for ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ in $\mathrm{CDCl}_{3}$, see Tables 2 and 3 .

Acknowledgment. The authors thank K. M. Snader (NPB) and P. Murphy (AIMS) for arrangement and execution of the sponge collections, D. Scudiero and A. Monks for antitumor screening, T. McCloud for extraction, and G. Gray for mass spectral analyses.
