#### Abstract

Three genuine saponins, named kinmoonosides $A-C(\mathbf{1}-\mathbf{3})$, have been isolated, together with a new monoterpenoid (4), from a methanolic extract of the fruits of Acacia concinna. The structures of kinmoonosides A-C were elucidated on the basis of spectral analysis as 3-0-\{ $\alpha$-L-arabinopyranosyl( $1 \rightarrow 6$ )[ $\beta$-D-glucopyranosyl ( $1 \rightarrow 2$ )]- $\beta$-D-glucopyranosyl $\}$-21-O-\{(6R,2E)-2-hydroxymethyl-6-methyl-6-O-[4-O-(2'E)-6'-hydroxyl-2'-hydroxymethyl-6'-methyl-2',7'-octadienoyl- $\beta$-D-qui novopyranosyl]-2,7-octadienoyl \}acacic acid 28-O- $\alpha$-L-arabinofuranosyl ( $1 \rightarrow 4$ )-[ $\beta$-d-glucopyranosyl $(1 \rightarrow 3)]-\alpha-$--rhamnopyranosyl $(1 \rightarrow 2)-\beta$-D-glucopyranosyl ester (1); 3-O-\{ $\alpha$-L-arabinopyranosyl ( $1 \rightarrow 6$ )-[ $\beta$-d-glucopyranosyl ( $1 \rightarrow 2$ )]- $\beta$-D-glucopyranosyl $\}$-21-O-\{(6S,2E)-2-hydroxymethyl-6-methyl-6-0-[4-O-(2'E )-6'-hydroxyl-2'-hydroxymethyl-6'-methyl-2', 7'-octadi-enoyl- $\beta$-D-quinobopyranosyl]-2,7-octadienoyl \}acacic acid 28-O- $\alpha$-L-arabinofuranosyl ( $1 \rightarrow 4$ )-[ $\beta$-D-glucopyranosyl $(1 \rightarrow 3)]-\alpha-L-r h a m n o p y r a n o s y l(1 \rightarrow 2)-\beta$-D-glucopyranosyl ester (2); and 3-O-\{ $\alpha-L$-arabinopyranosyl ( $1 \rightarrow 6$ )[ $\beta$-D-glucopyranosyl(1 $\rightarrow 2$ )]- $\beta$-D-glucopyranosyl \}-21-O-[(2E )-6-hydroxyl-2-hydroxymethyl-6-methyl-2,7octadi enoyl ]acacic acid 28-O- $\alpha$-L-arabinofuranosyl ( $1 \rightarrow 4$ )-[ $\beta$-D-glucopyranosyl ( $1 \rightarrow 3$ )]- $\alpha$-L-rhamnopyranosyl$(1 \rightarrow 2)-\beta$-d-glucopyranosyl ester (3), respectively. The new monoterpenoid 4 was determined as 4-O-[(2E)-6-hydroxyl-2-hydroxymethyl-6-methyl-2,7-octadienoyl]-d-quinovopyranose. Compounds $\mathbf{1 - 3}$ showed significant cytotoxicity against human HT-1080 fibrosarcoma cells.

Acadia concinna Wall. (Leguminosae) is a medicinal plant that grows in tropical rainforests of southern Asia, and the fruits of this plant are used for washing hair, for promoting hair growth, as an expectorant, emetic, and purgative. ${ }^{1}$ Although the pods of this plant are known to contain several saponins based on acacic acid, ${ }^{2}$ previous chemical examinations only resulted in the identification of flavonoids ${ }^{1}$ and monoterpenoids. ${ }^{3}$ The structures of several triterpene genins and prosapogenins were determined, ${ }^{4-6}$ and the genuine saponins were postulated to have structures similar to the leguminous saponins, acasiasides A and B from Acacia auriculiformis and julibrosides I-III from Albizia julibrissin. ${ }^{7}$

In the course of our study on medicinal plants from southeast Asia, ${ }^{8}$ we have found recently that a MeOH extract of the fruits of A . concinna from Myanmar showed significant cytotoxicity against human HT-1080 fibrosarcoma cells. Thus, we examined the constituents and identified three new genuine saponins, which were given the trivial names kinmoonosides A-C (1-3), based on a local name in Myanmar of the crude drug, "Kin moon thee". Also isolated was a new monoterpenoid (4). In this paper, we report the isolation and structure elucidation of 1-4 by spectroscopic techniques. Compounds 1-3 were found to be significantly cytotoxic against human HT-1080 fibrosarcoma cells.

## Results and Discussion

The pods of A. conci nna were extracted successively with $\mathrm{CHCl}_{3}$, EtOAc, $\mathrm{MeOH}, \mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ (1:1), and $\mathrm{H}_{2} \mathrm{O}$, and the cytotoxicity of each extract was tested against the highly liver-metastatic murine colon 26-L5 carcinoma ${ }^{9}$ and the human HT-1080 fibrosarcoma ${ }^{10}$ cell lines. All extracts showed only weak cytotoxicity against colon 26-L5 carcinoma cells; but against human HT-1080 fibrosarcoma cells, they showed cytotoxicities of various potencies [ED ${ }_{50}$ :

( $E_{50}$ : $\mathrm{H}_{2} \mathrm{O}$ eluate, $17.9 \mu \mathrm{~g} / \mathrm{mL} ; 50 \% \mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ eluate, $21.5 \mu \mathrm{~g} / \mathrm{mL}$; 75\% MeOH - $\mathrm{H}_{2} \mathrm{O}$ eluate, $2.1 \mu \mathrm{~g} / \mathrm{mL}$; MeOH eluate, $10.0 \mu \mathrm{~g} / \mathrm{mL}$ ), gave three genuine saponins named kinmoonosides $\mathrm{A}-\mathrm{C}(\mathbf{1}-\mathbf{3})$, while the $50 \% \mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ eluate yielded the new monoterpenoid 4.

The monoterpenoid 4 was obtained as a pale-yellow oil, and its molecular formula was determined to be $\mathrm{C}_{16} \mathrm{H}_{26} \mathrm{O}_{8}$ by HRFABMS. Its ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra (Table 3) were similar to those of methyl (2E)-6-hydroxyl-2-hydroxy-methyl-6-methyl-2,7-octadienoate 6-O- $\beta$-D-quinovoside, pre viously isolated from an alkaline hydrolysate of a saponin fraction of A. concinna collected in Bangladesh. ${ }^{7}$ H owever, the signals for the quinovose unit appeared as a pair of two anomers (1:1), and the signal for the quinovose (qui) $\mathrm{H}-4$ appeared at low field ( $\alpha$-anomer, $\delta_{\mathrm{H}} 4.67$; $\beta$-anomer, $\delta_{\mathrm{H}} 4.62$ ). Thus, the octadienoic acid moiety was considered to be located at C-4, not at C-1, of the quinovose, which was confirmed by the HMBC correlation between $\mathrm{H}-4$ of the quinovose (qui) and $\mathrm{C}-1^{\prime \prime}$ of the acid. From these data, the monoterpenoid 4 was concluded to be 4-O-[(2E)-6-hydroxyl-2-hydroxymethyl-6-methyl-2,7-octadienoyl]-D-quinovopyranose, except for the stereochemistry at C-6" of the octadienoic acid, which could not be determined due to the small amount obtained.

To elucidate the structures of the genuine saponins, we first conducted the alkalinehydrolysis of the crude saponin fraction of A. concinna and obtained four monoterpenoids (5-8) and five prosapogenins (9-13), while acid hydrolysis of the alkaline hydrolysate gave acacic acid lactone (14) ${ }^{5}$ (Figure 1). By analysis of their spectral data and comparison with literature values, monoterpenoids 5-7 were determined to be known compounds, namely, menthiafolic acid (5), ${ }^{7}$ a mixture (1:1) of (6S)- and (6R)-menthiafolic acid 6 -O- $\beta$-D-quinovopyranoside (6), ${ }^{7}$ and a mixture (2:1) of two diastereomers of 3,6-epoxy-2-hydroxymethyl-6-methyl-7octenoic acid (7), ${ }^{11}$ while prosapogenins 11-13 were identified as 3-O- $\beta$-D-xylopyranosyl( $1 \rightarrow 2$ )- $\alpha$-L-fucopyranosyl $(1 \rightarrow 6)$ -
[ $\beta$-D-glucopyranosyl ( $1 \rightarrow 2$ )]- $\beta$-D-glucopyranoside (11); ${ }^{12}$ acacic acid $3-\mathrm{O}-\beta$-D-xylopyranosyl $(1 \rightarrow 2)$ - $\alpha$-L-arabinopyranosyl( $1 \rightarrow 6$ )-2-acetamido-2-deoxy- $\beta$-d-glucopyranoside (12);13 and acacic acid Iactone $3-0-\beta$-D-xylopyranosyl $(1 \rightarrow 2)-\alpha-$-L-arabinopyranosyl( $1 \rightarrow 6$ )-[ $\beta$-D-glucopyranosyl( $1 \rightarrow 2$ )]- $\beta$-D-glucopyranoside (13, concinnoside $F=$ albiziasaponin $C$ ), ${ }^{5,14}$ respectively. Among the new compounds, monoterpenoid 8 was determined as a mixture (1:1) of (2E)-6-hydroxyl-2-hydroxymethyl-6-methyl-2,7-octadienoic acid 6-O- $\beta$-D-quinovopyranoside, by analysis of the spectral data and derivatization to methyl (2E)-6-hydroxyl-2-hydroxymethyl-6-methyl-2,7-octadienoate 6-O- $\beta$-d-quinovopyranoside ${ }^{6}$ and then to methyl (2E)-6-hydroxyl-2-hydroxymethyl-6-methyl-2,7-octadienoate. ${ }^{6}$ The absolute configuration at $\mathrm{C}-6$ of each isomer was determined to be $R$ (8a) and $S$ (8b) by comparing the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data (Table 3) with those of 6 and its methyl ester. ${ }^{7}$ The new prosapogenins, on the other hand, showed similar ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data (Tables 1 and 2) to those of prosapogenins 12 and 13, and to concinnosides $A-F, 5$ prosapogenins of $A$. concinna collected in Bangladesh, and their structures were determined by spectral data (Figure 2 in Supporting Information) interpretation to be acacic acid 3-O- $\alpha-$ L-arabinopyranosyl ( $1 \rightarrow 6$ )[ $\beta$-D-glucopyranosyl ( $1 \rightarrow 2$ )]- $\beta$-D-glucopyranoside (9) and acacic acid 3-O- $\alpha$-L-arabinopyranosyl $(1 \rightarrow 6)$-2-acetamido-2-deoxy-$\beta$-d-glucopyranoside (10).

Kinmoonoside A (1) was obtained as a colorless amorphous solid, and its molecular formula was determined to be $\mathrm{C}_{96} \mathrm{H}_{152} \mathrm{O}_{47}$ by HRFABMS. By extensive analysis of its 2D NMR spectra, the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data for the aglycon moiety and the trisaccharide unit at C-3 were found to be almost the same as those of prosapogenin 9 (Tables 1 and 2). Thus, 1 was found to be a derivative of $3-\mathrm{O}-\{\alpha-\mathrm{L}-$ arabinopyranosyl ( $1 \rightarrow 6$ )-[ $\beta$-D-glucopyranosyl $(1 \rightarrow 2)]-\beta$-Dglucopyranosyl \}acacic acid, which was confirmed by the long-range correlations observed in the HMBC spectrum (Figure 3 in Supporting Information). In addition, the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of $\mathbf{1}$ indicated the presence of five additional sugars and two monoterpenes (Tables 2 and 3 ). Based on the chemical shifts and coupling constants, the sugars were determined to be two $\beta$-glucopyranose units ( $\mathrm{glc}_{3}-1$ : $\delta_{\mathrm{H}} 5.33, \mathrm{~d}, \mathrm{~J}=7.5 \mathrm{~Hz}, \delta_{\mathrm{C}} 95.4$; glc4-1: $\delta_{\mathrm{H}} 4.49, \mathrm{~d}$, J $=7.7 \mathrm{~Hz}, \delta_{c} 105.8$ ), an $\alpha$-rhamnopyranose (rha-1: $\delta_{H}$ 5.34, br s; $\delta_{\mathrm{C}}$ 101.3), an $\alpha$-arabinofuranose [ara(f)-1: $\delta_{\mathrm{H}}$ $5.35, \mathrm{br} \mathrm{s} ; \delta_{\mathrm{C}}$ 111.0], and a $\beta$-quinovopyranose (qui-1: $\delta_{\mathrm{H}}$ $4.40, \mathrm{~d}, \mathrm{~J}=7.7 \mathrm{~Hz} ; \delta_{c} 99.2$ ), while the monoterpenes were two (2E)-6-hydroxyl-2-hydroxymethyl-6-methyl-2,7-octadienoic acid units.

The two octadienoic acid moieties were placed at C-21 of the aglycon and at C-4 of the quinovose (qui), from the lowfield shifts of H-21 ( $\delta_{\mathrm{H}} 5.50$ ) of the aglycon and H-4 ( $\delta_{\mathrm{H}}$ 4.64) of the quinovose (qui) and acylation shifts ${ }^{15,16}$ at $\mathrm{C}-20$ (1, $\delta_{\mathrm{C}} 35.9 ; \mathbf{9}, \delta_{\mathrm{C}} 36.7$ ), C-21 (1, $\delta_{\mathrm{C}} 78.7$; $9, \delta_{\mathrm{C}} 75.2$ ), and C-22 (1, $\delta_{C} 36.4 ; \mathbf{9}, \delta_{C} 41.1$ ) of the aglycon and at C-3 (1, $\delta_{\mathrm{C}}$ 75.6 ; 8a, $\delta_{C} 77.9$ ), C-4 (1, $\delta_{C} 77.7$; 8a, $\delta_{C} 77.0$ ), and C-5 (1, $\delta_{\mathrm{C}} 70.9 ; 8 \mathrm{a}, \delta_{\mathrm{C}} 72.8$ ) of the quinovose (qui). From these data and analysis of the HMBC correlations (Figure 3 in Supporting Information), the ester residue at C-21 of the aglycon was determined as (2E )-2-hydroxymethyl-6-meth-yl-6-O-[4-O-(2'E)-6'-hydroxyl-2'-hydroxymethyl-6'-methyl-2',7'-octadienoyl- $\beta$-d-quinovopyranosyl]-2,7-octadienoate, which was supported by the observation of ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data similar to those of monoterpenoids 4 and 8 (Table 3). The NMR data, especially for $\mathrm{H}-7^{\prime}, \mathrm{H}-10^{\prime}, \mathrm{C}-5^{\prime}$, and $\mathrm{C}-8^{\prime}$ of the inner monoterpene, more closely resembled those of 8a (6R) rather than $\mathbf{8 b}$ (6S), indicating the absol ute configuration at C-6' of the inner monoterpene to be R , but that

${ }^{\text {a }}$ Chemical shift, coupling pattern, and coupling constant of the corresponding anomeric proton.
of the outer monoterpene could not be determined due to shortage of the amount obtained.

The remaining residues to be placed were two $\beta$-glucopyranoses, an $\alpha$-arabinofuranose, and an $\alpha$-rhamnopyranose. The FABMS of 1 revealed a fragment ion at m/z 1477 [M $+\mathrm{Na}-603]^{+}$, suggesting that the four sugars were linked at C-28 as a tetrasaccharide residue. 12,17 The characteristic signals for the anomeric proton ( $\delta_{\mathrm{H}} 5.33$ ) and carbon ( $\delta_{\mathrm{C}}$ 95.4) of the $\beta$-glucopyranose ( $\mathrm{glc}_{3}$ ) suggested that this glucose should be directly attached to C-28 through an ester bond, which was confirmed by the HMBC correlation between $\mathrm{H}-1\left(\delta_{\mathrm{H}} 5.33\right)$ of the glucose ( $\mathrm{glc}_{3}$ ) and $\mathrm{C}-28$ ( $\delta_{\mathrm{C}}$ 175.3) of the aglycon. Similarly, long-range correlations were observed between $\mathrm{C}-2\left(\delta_{\mathrm{C}} 76.3\right)$ of the glucose $\left(\mathrm{glc}_{3}\right)$ and $\mathrm{H}-1\left(\delta_{\mathrm{H}} 5.34\right)$ of the rhamnose (rha), between $\mathrm{C}-3\left(\delta_{\mathrm{C}}\right.$ 82.7) of the rhamnose (rha) and $\mathrm{H}-1$ ( $\delta_{\mathrm{H}} 4.99$ ) of the glucose ( $\mathrm{g} \mathrm{c}_{4}$ ), and between C-4 ( $\delta_{\mathrm{C}} 78.9$ ) of the rhamnose (rha) and $\mathrm{H}-1\left(\delta_{\mathrm{H}} 5.35\right)$ of the arabinose [ara(f)] (Figure 3 in Supporting Information). Thus, the tetrasaccharide residue at C -28 of the aglycon was determined to be $\alpha-\mathrm{L}$-arabinofuranosyl $(1 \rightarrow 4)$-[ $\beta$-D-glucopyranosyl ( $1 \rightarrow 3$ )]- $\alpha-$ L-rhamnopyranosyl ( $1 \rightarrow 2$ )- $\beta$-D-glucopyranosyl.

From these data, kinmoonoside A was assigned as 3-O-$\{\alpha$-L-arabinopyranosyl( $1 \rightarrow 6$ )-[ $\beta$-d-glucopyranosyl( $1 \rightarrow 2$ )]- $\beta$ -D-glucopyranosyl \}-21-O-\{(6R,2E)-2-hydroxymethyl-6-methyl-6-O-[4-O-(2'E )-6'-hydroxyl-2'-hydroxymethyl-6'-methyl-2',7'-octadienoyl- $\beta$-d-quinobopyranosyl]-2,7-octadienoyl \}acacic acid 28-O- $\alpha$-L-arabinofuranosyl( $1 \rightarrow 4$ )-[ $\beta$-d-glucopyranosyl $(1 \rightarrow 3)]$ -$\alpha$-L-rhamnopyranosyl( $1 \rightarrow 2$ )- $\beta$-D-glucopyranosyl ester (1). Previously, several triterpenoid saponins with a menthiafolic acid and/or (2E)-6-hydroxyl-2-hydroxymethyl-6-meth-yl-2,7-octadienoic acid residue have been reported. ${ }^{16,18}$ The acid moiety, however, usually has a 6S configuration, and only three triterpenoid saponins with a (6R)-acid are known, proceraoside C from Albizia procera and julibrosides $\mathrm{J}_{1}$ and $\mathrm{J}_{14}$ from A. julibrissin (Leguminosae). ${ }^{19}$ However, the acid is menthiafol ic acid, and there is no prior example of a triterpenoid saponin with a (2E)-6-hydroxyl-2-hydroxymethyl-6-methyl-2,7-octadienoic acid unit having a (6R)-configuration.

Kinmoonoside $B$ (2) gave a $[\mathrm{M}+\mathrm{H}]^{+}$ion at $\mathrm{m} / \mathrm{z}$ 2057.9575 in its HRFABMS, suggesting the same molecular formula, $\mathrm{C}_{96} \mathrm{H}_{152} \mathrm{O}_{47}$, as $\mathbf{1}$. Its ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data (Tables 1-3 and Experimental Section), analyzed by 2D
Table 3. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR Data in $\mathrm{CD}_{3} \mathrm{OD}$ for the $\mathrm{C}-21$ Saccharide Portions of Kinmoonosides $\mathrm{A}-\mathrm{C}$ (1-3) and Monoterpenoids $\mathbf{4}$ and $\mathbf{8}$

Figure 1. Hydrolysis of the Crude Saponin Mixture of A. concinna.

NMR spectra, were very similar to those of $\mathbf{1}$, except for those of C-5', C-7', C-8', and C-10' of the inner monoterpene. This difference was reasonably understood to be due to the configurational difference at C-6' of the inner monoterpene, as observed in $\mathbf{8 a}\left(6^{\prime} R\right)$ and $\mathbf{8 b}\left(\sigma^{\prime} \mathrm{S}\right)$. Thus, kinmoonoside B was conduded to be $3-\mathrm{O}-\{\alpha-\mathrm{L}-$ arabinopyranosyl $(1 \rightarrow 6)-[\beta-$ D-glucopyranosyl ( $1 \rightarrow 2$ )]- $\beta$-D-glucopyranosyl \}-21-O-\{(6S,2E)-2-hydroxymethyl-6-methyl-6-O-[4-O-(2'E)-6'-hydroxyl- 2 -hydroxymethyl- $\mathbf{6}^{\prime}$-methyl- 2 , $7^{7}$-odadienoyl- $\beta$-D-quinobopyranosyl [-2,7-octadienoyl \}acacic acid 28-O- $\alpha$-L-arabinofuranosyl ( $1 \rightarrow 4$ )-[ $\beta$-D-glucopyranosyl $(1 \rightarrow 3)]-\alpha-$-L-rhamnopyranosyl ( $1 \rightarrow 2$ ) $-\beta$-D-glucopyranosyl ester (2).

Kinmoonoside C (3) was determined to have the molecular formula $\mathrm{C}_{80} \mathrm{H}_{128} \mathrm{O}_{40}$ by HRFABMS, and its ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra (Tables 1-3 and Experimental Section) resembled those of kinmoonosides A (1) and B (2). However, they revealed a lack of the outer monoterpene and the $\beta$-quinovopyranose moiety in 1 and 2. Thus, kinmoonoside C was concluded to be $3-0-\{\alpha-L$-arabinopyranosyl $(1 \rightarrow 6)$ -$[\beta$-D-glucopyranosyl ( $1 \rightarrow 2$ )]- $\beta$-D-glucopyranosyl $\}-21-\mathrm{O}-[(2 \mathrm{E})$ -6-hydroxyl-2-hydroxymethyl-6-methyl-2,7-octadienoyl]acacic acid $28-\mathrm{O}-\alpha-\mathrm{L}-$ arabinofuranosyl( $1 \rightarrow 4$ )-[ $\beta$-D-glucopyranosyl( $1 \rightarrow 3$ )]- $\alpha$-L-rhamnopyranosyl ( $1 \rightarrow 2$ )- $\beta$-D-glucopyranosyl ester (3), which was confirmed by similar HMBC correlations observed for $\mathbf{1}$.

Finally, the cytotoxic activity of compounds $\mathbf{1 - 1 3}$ was examined against human HT-1080 fibrosarcoma cells. Although monoterpenoids 4-8 and prosapogenins 9-13 were inactive ( $E D_{50},>100 \mu \mathrm{~g} / \mathrm{mL}$ ), the genuine saponins 1-3 showed significant cytotoxic activity, with $\mathrm{ED}_{50}$ values of $0.70,0.91$, and $2.83 \mu \mathrm{M}$, respectively. Their cytotoxicity was greater than that of 5 -fluorouracil ${ }^{20}\left(E_{50}, 8.0 \mu \mathrm{M}\right)$. $E D_{50}$ values of $<4 \mu \mathrm{~g} / \mathrm{mL}$ are regarded as being significantly cytotoxic. ${ }^{21}$ By comparing the cytotoxicity of the genuine saponins 1-3 with the prosapogenins 9-13, the tetrasaccharide at C-28 of the aglycon may be considered to be important for the mediation of their cytotoxicity, as reported in the case of julibrosides I-III. ${ }^{13}$ Although both the trisaccharide unit at C-3 of the aglycon and the ester moiety at C-21 of the aglycon were not crucial for the cytotoxicity, difference in the activities among 1-3 seems to suggest that the ester at C-21 of the aglycon may intensify the cytotoxicity.

## Experimental Section

General Experimental Procedures. Optical rotations were measured on a J ASCO DIP-140 digital polarimeter. ${ }^{1} \mathrm{H}$, ${ }^{13} \mathrm{C}$, and 2D NMR were taken on a J EOL GX-400 spectrometer with tetramethylsilane(TMS) as an internal standard. FABMS and HRFABMS measurements were carried out on a JEOL J MS-700T spectrometer, and glycerol was used as a matrix. Column chromatography was performed with Diaion HP-20 or MCI-gel CHP-20P (both Mitsubishi Kasei Co., Ltd., Tokyo, J apan), and analytical and preparative TLC were carried out on precoated Merck Kieselgel $60 \mathrm{~F}_{254}$ plates ( 0.25 or 0.50 mm thickness) or $\mathrm{RP}_{18} \mathrm{~F}_{254}$ plates ( 0.25 mm thickness). Mediumpressure liquid chromatography (MPLC) was performed with a Chemco model 61-M-2 system, and HPLC was conducted with a Shimadzu LC-6AD system.

Plant Material. F ruits of A. concinna were purchased from Sandhi Brothers Trading Co., Ltd., at Yangon, Myanmar, in October 1997, and identified by Prof. Daw Khin May Ni (University of Distance Education Mandalay, Myanmar). A voucher sample (TMPW no. 18579) is preserved in the Museum for Materia Medica, Institute of Natural Medicine, Toyama Medical and Pharmaceutical University.

Extraction and Isolation. Fruits of A. concinna were separated into pods and seeds, and the pods ( 3.6 kg ) were extracted successively at room temperature with $\mathrm{CHCl}_{3}$ ( 5 L , $7 \mathrm{~d} \times 2$ ), $\operatorname{EtOAc}(5 \mathrm{~L}, 7 \mathrm{~d} \times 2)$, and MeOH , $(5 \mathrm{~L}, 7 \mathrm{~d} \times 2$ ), and then with $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}(1: 1)\left(5 \mathrm{~L}\right.$, reflux $\times 2$ ) and $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~L}$, reflux $\times 2$ ). Each extract was evaporated under reduced pressure to give $\mathrm{CHCl}_{3}(20 \mathrm{~g})$, EtOAc (19 g), MeOH (1.2 kg), $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}(1: 1)(276 \mathrm{~g})$, and $\mathrm{H}_{2} \mathrm{O}(208 \mathrm{~g})$ residues. The MeOH extract ( 300 g ) was subjected to Diaion HP-20 (1.5 L) column chromatography with $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}(0 \%, 50 \%, 75 \%$, $100 \%$; each 3 L ) to give four fractions ( $\mathrm{H}_{2} \mathrm{O}$ el uate, $161 \mathrm{~g} ; 50 \%$ $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ eluate, $17 \mathrm{~g} ; 75 \% \mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ eluate, 49 g ; MeOH eluate, 31 g ).

A part $(3.0 \mathrm{~g})$ of the $50 \% \mathrm{H}_{2} \mathrm{O}-\mathrm{MeOH}$ eluate was separated by MCI-gel CHP-20P ( 50 mL ) column chromatography with a $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}(10 \%, 25 \%, 45 \%, 60 \%, 80 \%, 100 \%)$ solvent system to give six fractions ( $10 \% \mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ eluate, 240 mg ; 25\% $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ eluate, $428 \mathrm{mg} ; 45 \% \mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ eluate, 702 mg ; $60 \% \mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ eluate, $520 \mathrm{mg} ; 80 \% \mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ eluate, 664 mg ; MeOH eluate, 250 mg ). The $25 \% \mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ eluate ( 400 mg ) was subjected to MPLC separation with $\mathrm{CHCl}_{3}-\mathrm{MeOH}-$ $\mathrm{H}_{2} \mathrm{O}$ (7:3:0.5) to give five fractions (fraction 1, 48 mg ; fraction $2,60 \mathrm{mg}$; fraction $3,110 \mathrm{mg}$; fraction $4,45 \mathrm{mg}$; fraction 5,80 mg ), and fraction 3 gave 4-O-[(2E)-6-hydroxyl-2-hydroxy-
methyl-6-methyl-2,7-octadienoyl ]-d-quinovopyranose (4, 12.3 mg ) by preparative TLC with $\mathrm{CHCl}_{3}-\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ (7:3:0.5).

The $75 \% \mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ eluate was separated ( 500 mg each, 6 times) by MPLC (column: Lichroprep RP ${ }_{18}, 40-63 \mu \mathrm{~m}$, size B) with a $\mathrm{CH}_{3} \mathrm{CN}-\mathrm{H}_{2} \mathrm{O}$ sol vent system ( $20-40 \%$ at intervals of $5 \%$; each 200 mL ; flow rate, $2.0 \mathrm{~mL} / \mathrm{min}$ ) to give five fractions (fraction 1, 760 mg ; fraction $2,870 \mathrm{mg}$; fraction $3,494 \mathrm{mg}$; fraction $4,792 \mathrm{mg}$; fraction $5,57 \mathrm{mg})$. Fraction $1(600 \mathrm{mg})$ was again separated by MPLC (column: Lichroprep $\mathrm{RP}_{8}, 40-63$ $\mu \mathrm{m}$, size A) with a $\mathrm{CH}_{3} \mathrm{CN}-\mathrm{H}_{2} \mathrm{O}$ solvent system ( $20-35 \%$ at intervals of $3 \%$; each 50 mL ; flow rate, $2.0 \mathrm{~mL} / \mathrm{min}$ ) to yield six fractions, and subfraction $2(67 \mathrm{mg})$ was subjected to reversed-phase preparative TLC with $\mathrm{Me}_{2} \mathrm{CO}-\mathrm{H}_{2} \mathrm{O}$ (4:6) to give kinmoonoside C ( $3,18.6 \mathrm{mg}$ ). In turn, fraction $2(870 \mathrm{mg})$ was separated by MPLC (column: Lichroprep RP ${ }_{18}, 40-63 \mu \mathrm{~m}$, size B) with an $\mathrm{Me}_{2} \mathrm{CO}-\mathrm{H}_{2} \mathrm{O}$ solvent system (20-40\% at intervals of 2\%; each 100 mL ; flow rate, $2.0 \mathrm{~mL} / \mathrm{min}$ ) to yield 20 fractions, and subfractions $13(106 \mathrm{mg})$ and $16(76 \mathrm{mg})$ were subjected to an HPLC separation (column: Supel co Discovery $\mathrm{C}_{18}, 250 \mathrm{~mm} \times 21.2 \mathrm{~mm}, 5 \mu \mathrm{~m} ; \mathrm{UV}, 220 \mathrm{~nm}$ ) with $\mathrm{CH}_{3} \mathrm{CN}-$ $\mathrm{H}_{2} \mathrm{O}$ (27.5:72.5 and 28:72, respectively; flow rate, $10 \mathrm{~mL} / \mathrm{min}$ ) to give kinmoonosides $A(\mathbf{1}, 13.1 \mathrm{mg})$ and $B(\mathbf{2}, 13.3 \mathrm{mg})$.

Kinmoonoside A (1): colorless amorphous solid; $[\alpha]^{25}{ }_{D}$ $-14.4^{\circ}(\mathrm{c} 0.44, \mathrm{MeOH}){ }^{1}{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CD}_{3} \mathrm{OD}, 400 \mathrm{MHz}\right.$ ) aglycon $\delta 5.50(1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=10.9,5.6 \mathrm{~Hz}, \mathrm{H}-21), 5.35(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{H}-12)$, $4.49(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{H}-16), 3.24(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-3), 2.98(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-18)$, 1.42 (3H, s, H $\mathrm{H}_{3}-27$ ), 1.09 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-24$ ), 1.05 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-30$ ), $0.97\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-25\right), 0.88\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-29\right), 0.86\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-23\right)$, 0.78 (3H, s, $\mathrm{H}_{3}-26$ ); for other NMR data, see Tables $1-3$; FABMS m/z $2080.0[\mathrm{M}+\mathrm{Na}]^{+}, 2058.0[\mathrm{M}+\mathrm{H}]^{+}, 1477.7$ [ $\mathrm{M}+$ Na - glc - ara - rha - glc] ${ }^{+}$; HRFABMS m/z 2057.9541 (cal cd for $\mathrm{C}_{96} \mathrm{H}_{153} \mathrm{O}_{47}[\mathrm{M}+\mathrm{H}]^{+}, 2057.9582$ ).

Kinmoonoside B (2): col orless amorphous solid; $[\alpha]^{25}$ D $-38.5^{\circ}$ (c 0.66, MeOH); ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CD}_{3} \mathrm{OD}, 400 \mathrm{MHz}$ ) aglycon $\delta 5.49(1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=10.4,5.2 \mathrm{~Hz}, \mathrm{H}-21), 5.35(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{H}-12)$, 4.48 ( $1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{H}-16$ ), $3.22(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-3), 2.98(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-18)$, 1.42 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-27$ ), 1.09 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-24$ ), 1.05 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-30$ ), $0.97\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-25\right), 0.88\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-29\right), 0.86\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-23\right)$, 0.78 (3H, s, $\left.\mathrm{H}_{3}-26\right)$; for other NMR data, see Tables 1-3; FABMS m/z 2080.0 [ $\mathrm{M}+\mathrm{Na}]^{+}, 2058.0[\mathrm{M}+\mathrm{H}]^{+}, 1477.7$ [ $\mathrm{M}+$ Na - glc - ara - rha - glc] ${ }^{+}$; HRFABMS m/z 2057.9575 (cal cd for $\mathrm{C}_{96} \mathrm{H}_{153} \mathrm{O}_{47}[\mathrm{M}+\mathrm{H}]^{+}, 2057.9582$ ).

Kinmoonoside C (3): colorless amorphous solid; $[\alpha]^{25}{ }_{D}$ $+8.4^{\circ}$ (c $0.35, \mathrm{MeOH}$ ); ${ }^{1} \mathrm{H}$ NMR (CD $3 \mathrm{OD}, 400 \mathrm{MHz}$ ) aglycon $\delta$ 5.49 ( $1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=10.5,5.1 \mathrm{~Hz}, \mathrm{H}-21$ ), 5.36 ( $1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{H}-12$ ), 4.49 ( 1 H, br s, H-16), 3.22 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{H}-3$ ), 3.08 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{H}-18$ ), $1.42\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-27\right), 1.09\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-24\right), 1.05\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-30\right)$, $0.97\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-25\right), 0.88\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-29\right), 0.87\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-23\right)$, 0.78 (3H, s, $\left.\mathrm{H}_{3}-26\right)$; for other NMR data, see Tables 1-3; FABMS m/z $1751.8[\mathrm{M}+\mathrm{Na}]^{+}, 1729.8[\mathrm{M}+\mathrm{H}]^{+} ;$HRFABMS $\mathrm{m} / \mathrm{z} 1751.7849$ (calcd for $\mathrm{C}_{80} \mathrm{H}_{128} \mathrm{O}_{40} \mathrm{Na}[\mathrm{M}+\mathrm{Na}]^{+}, 1751.7880$ ), 1729.8029 (calcd for $\mathrm{C}_{80} \mathrm{H}_{129} \mathrm{O}_{40}[\mathrm{M}+\mathrm{H}]^{+}, 1729.8060$ ).

4-O-[(2E )-6-H ydroxyl-2-hydroxymethyl-6-methyl-2,7-octadienoyl]-D-quinovopyranose (4): light yellow oil; [ $\alpha]^{25}$ D $+19.3^{\circ}$ (c $\left.0.40, \mathrm{MeOH}\right)$; ${ }^{1} \mathrm{H}\left(\mathrm{CD}_{3} \mathrm{OD}, 400 \mathrm{MHz}\right)$ and ${ }^{13} \mathrm{C}\left(\mathrm{CD}_{3}-\right.$ OD, 100 MHz ) NMR, see Table 3; FABMS m/z 369.2 [M + $\mathrm{Na}^{+}$, $347.2\left[\mathrm{M}+\mathrm{H}^{+}\right.$; HRFABMS m/z 347.1734 (calcd for $\left.\mathrm{C}_{16} \mathrm{H}_{27} \mathrm{O}_{8}[\mathrm{M}+\mathrm{H}]^{+}, 347.1706\right)$.

Hydrolysis of Saponin Fraction. A part of the 75\% $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ eluate ( 10.0 g ) was suspended in $\mathrm{BuOH}(100 \mathrm{~mL}$ ), and the soluble material ( 200 mg ) was separated off by filtration. The BuOH -insoluble fraction $(9.8 \mathrm{~g})$ was hydrol yzed with $0.5 \mathrm{M} \mathrm{NaOH}-\mathrm{MeOH}(7: 1,160 \mathrm{~mL})$ at room temperature for 24 h . After neutralization by 1 M HCl , followed by concentration in vacuo to remove MeOH , the residual solution was extracted with EtOAc ( $200 \mathrm{~mL} \times 3$ ) and then BuOH (200 $\mathrm{mL} \times 3$ ) to give EtOAc-soluble ( 1.5 g ) and BuOH-soluble (5.3 g) hydrolysates.

The EtOAc-soluble hydrolysate ( 500 mg ) was subjected to MPLC (column: Lichroprep Si60, 40-63 $\mu \mathrm{m}$, size B; solvent: $\mathrm{CHCl}_{3}-\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}, 8: 4: 0.5$; flow rate: $2.0 \mathrm{~mL} / \mathrm{min}$ ) to give five fractions (fraction $1,33 \mathrm{mg}$; fraction $2,100 \mathrm{mg}$; fraction 3, 161 mg ; fraction 4, 139 mg ; fraction $5,70 \mathrm{mg}$ ). Fractions 2-4 were subjected separately to preparative TLC with $\mathrm{CHCl}_{3}-\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}-\mathrm{HOAc}$ (8:2:0.5:0.01, 8:3:0.5:0.01, and 8:4:
0.5:0.01, respectively) to give menthiafolic acid ${ }^{7}$ ( $5,7.0 \mathrm{mg}$ ), a mixture ( $1: 1$ ) of (6S)- and (6R)-menthiafolic acid $6-0-\beta$-Dquinovopyranoside ${ }^{7}(6,60.0 \mathrm{mg}$ ), and a mixture (2:1) of two diastereomers of 3,6-epoxy-2-hydroxymethyl-6-methyl-7-octenoic acid ${ }^{11}(\mathbf{7}, 20.0 \mathrm{mg})$, respectively.
The BuOH-sol uble hydrolysate ( 500 mg each, 3 times) was separated by MPLC (column: Lichroprep RP ${ }_{18}, 40-63 \mu \mathrm{~m}$, size B; solvent: $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}, 6: 4$; flow rate: $2.0 \mathrm{~mL} / \mathrm{min}$ ) to give five fractions (fraction 1, 600 mg ; fraction $2,440 \mathrm{mg}$; fraction $3,53 \mathrm{mg}$; fraction 4, 240 mg ; fraction 5, 89 mg ). Parts of fractions 1 ( 100 mg ) and 2 ( 100 mg ) were subjected to preparative TLC with $\mathrm{CHCl}_{3}-\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ (7:3:0.5 and 8:4: 0.5 , respectively) to give (2E)-6-hydroxyl-2-hydroxymethyl-6-methyl-2,7-octadienoic acid 6-O- $\beta$-D-quinovopyranoside (8, 56.4 mg ) and prosapogenins $9(26.3 \mathrm{mg})$ and $13^{5,14}(9.7 \mathrm{mg})$, respectively. In turn, a part of fraction $4(150 \mathrm{mg})$ was subjected to MPLC (column: Lichroprep Si60, 40-63 $\mu \mathrm{m}$, size B; solvent: $\mathrm{CHCl}_{3}-\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$, 8:4:0.5; flow rate: $2.0 \mathrm{~mL} /$ min ) to yield four fractions (fraction $4-1,11 \mathrm{mg}$; fraction $4-2$, 73 mg ; fraction $4-3,53 \mathrm{mg}$; fraction $4-4,4 \mathrm{mg}$ ). Subfractions 2 and 3 were separated by preparative TLC with $\mathrm{CHCl}_{3}-$ $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}-\mathrm{HOAc}(8: 4: 0.5: 0.01)$ to give prosapogenins 10 $(18.7 \mathrm{mg})$ and $\mathbf{1 1}^{12}(13.9 \mathrm{mg})$ and prosapogenin $\mathbf{1 2}^{13}(24.7 \mathrm{mg})$, respectively.

Another part ( 50 mg ) of the BuOH -soluble hydrolysate was treated with $5 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}$-1,4-dioxane ( $1: 1,10 \mathrm{~mL}$ ) at $90^{\circ} \mathrm{C}$ for 12 h . The reaction mixture was extracted with EtOAc ( 10 mL $\times 3$ ), and the extract was concentrated in vacuo and purified by preparative TLC with $\mathrm{MeOH}-\mathrm{CHCl}_{3}(1: 30)$ to give acacic acid lactone ${ }^{5}(\mathbf{1 4}, 2.5 \mathrm{mg})$.
(2E )-6-Hydroxyl-2-hydroxymethyl-6-methyl-2,7-octadienoic acid 6-0- $\beta$-D-Quinovopyranoside (8): light yellow oil; $[\alpha]^{25} \mathrm{D}+17.2^{\circ}(\mathrm{c} 0.10, \mathrm{MeOH}) ;{ }^{1} \mathrm{H}\left(\mathrm{CD}_{3} \mathrm{OD}, 400 \mathrm{MHz}\right)$ and ${ }^{13} \mathrm{C}$ ( $C^{2} D_{3}$ OD, 100 MHz ) NMR, see Table 3; FABMS m/z 369.2 [M $+\mathrm{Na}]^{+}, 347.2\left[\mathrm{M}+\mathrm{H}^{+}, 329.2\left[\mathrm{M}+\mathrm{H}-\mathrm{H}_{2} \mathrm{O}\right]^{+}\right.$; HRFABMS $\mathrm{m} / \mathrm{z} 347.1723$ (cal cd for $\mathrm{C}_{16} \mathrm{H}_{27} \mathrm{O}_{8}[\mathrm{M}+\mathrm{H}]^{+}, 347.1706$ ).
Prosapogenin 9: col orless amorphous solid; $[\alpha]^{25} \mathrm{D}+1.1^{\circ}$ (c $0.53, \mathrm{MeOH}$ ); ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CD}_{3} \mathrm{OD}, 400 \mathrm{MHz}$ ) aglycon $\delta 5.30$ ( $1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{H}-12$ ), 4.48 ( $1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{H}-16$ ), 4.12 ( $1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=11.4$, $5.3 \mathrm{~Hz}, \mathrm{H}-21$ ), 3.05 ( $1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=14.0,4.0 \mathrm{~Hz}, \mathrm{H}-18$ ), 1.37 ( 3 H , $\left.\mathrm{s}, \mathrm{H}_{3}-27\right), 1.08$ ( $3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-29$ ), $0.95\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-25\right), 0.93$ ( $6 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{H}_{3}-23, \mathrm{H}_{3}-30\right), 0.85\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-24\right), 0.79\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-26\right)$; for other NMR data, see Tables 1 and 2; FABMS m/z $967.5[\mathrm{M}+\mathrm{Na}]^{+}$, 795.3 [ $\mathrm{M}+\mathrm{H}-\mathrm{H}_{2} \mathrm{O}-\mathrm{ara}^{+}, 765.3\left[\mathrm{M}+\mathrm{H}-\mathrm{H}_{2} \mathrm{O}-\mathrm{glc}\right]^{+}$, $471.1\left[\mathrm{M}+\mathrm{H}-\mathrm{H}_{2} \mathrm{O}-\mathrm{glc}-\mathrm{ara}-\mathrm{glc}\right]^{+} ;$HRFABMS m/z 967.4852 (calcd for $\mathrm{C}_{47} \mathrm{H}_{76} \mathrm{O}_{19} \mathrm{Na}[\mathrm{M}+\mathrm{Na}]^{+}, 967.4879$ ).

Prosapogenin 10: col orless amorphous solid; $[\alpha]^{25} \mathrm{D}-35.7^{\circ}$ (c $0.47, \mathrm{MeOH}$ ); ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CD}_{3} \mathrm{OD}, 400 \mathrm{MHz}$ ) aglycon $\delta 5.30$ ( 1 H, br s, H-12), 4.48 ( 1 H , br s, H-16), 4.13 ( $1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=11.2$, $5.4 \mathrm{~Hz}, \mathrm{H}-21$ ), 3.11 ( $1 \mathrm{H}, \mathrm{dd}, \mathrm{J}=11.5,4.2 \mathrm{~Hz}, \mathrm{H}-3$ ), 3.03 ( 1 H , dd, J $=13.7,4.0 \mathrm{~Hz}, \mathrm{H}-18)$, $1.37\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-27\right), 0.95(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{H}_{3}-29\right), 0.94\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-25\right), 0.93$ ( $6 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-23, \mathrm{H}_{3}-30$ ), 0.78 ( 3 H , $\left.\mathrm{s}, \mathrm{H}_{3}-26\right), 0.76\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{3}-24\right)$; for other NMR data, see Tables 1 and 2; FABMS m/z $846.5[\mathrm{M}+\mathrm{Na}]^{+}, 824.5[\mathrm{M}+\mathrm{H}]^{+}, 806.5$ $\left[\mathrm{M}+\mathrm{H}-\mathrm{H}_{2} \mathrm{O}\right]^{+}$; HRFABMS m/z 846.4616 (calcd for $\mathrm{C}_{43} \mathrm{H}_{69} \mathrm{O}_{14-}$ $\mathrm{NNa}[\mathrm{M}+\mathrm{Na}]^{+}, 846.4616$ ), 824.4798 (calcd for $\mathrm{C}_{43} \mathrm{H}_{70} \mathrm{O}_{14} \mathrm{~N}$ [ $\mathrm{M}+\mathrm{H}]^{+}, 824.4796$ ).
Methylation and Enzymatic Hydrolysis of Monoterpenoid 8. Monoterpenoid $8(20.0 \mathrm{mg})$ was methylated with diazomethane, followed by purification with preparative TLC ( $\mathrm{MeOH}-\mathrm{CHCl}_{3}, 7: 3$ ), to give methyl (2E)-6-hydroxyl-2-hy-droxymethyl-6-methyl-2,7-octadienoate 6-O- $\beta$-d-quinovopyranoside ${ }^{6}$ ( 10.5 mg ). Enzymatic hydrolysis of the methyl ester with $\beta$-glucosidase from almonds ( 30 mg ; Sigma, 2.4 units $/ \mathrm{mg}$ ) in acetate buffer ( $1 \mathrm{~mL}, \mathrm{pH} 5.0$ ) for 2 days, followed by Si gel $(3 \mathrm{~g})$ column chromatography with $\mathrm{MeOH}-\mathrm{CHCl}_{3}$ (9:1), gave methyl (2E)-6-hydroxyl-2-hydroxymethyl-6-methyl-2,7-octadienoate ${ }^{6}$ ( 3.1 mg ).

Cytotoxicity Assay. Cytotoxicity against human HT-1080 fibrosarcoma cells was determined using a standard 3-(4,5-dimethylthiazol-2-yl)-2,5-dimethyltetrazolium bromide assay as described previously. 22 The ED ${ }_{50}$ value of each compound was: 1, $4.89 \mu \mathrm{~g} / \mathrm{mL}(2.83 \mu \mathrm{M})$; 2, $1.43 \mu \mathrm{~g} / \mathrm{mL}(0.70 \mu \mathrm{M})$; 3, 1.87 $\mu \mathrm{g} / \mathrm{mL}(0.91 \mu \mathrm{M}) ; 4-13,>100 \mu \mathrm{~g} / \mathrm{mL}$; 5-fluorouracil, $1.05 \mu \mathrm{~g} /$ $\mathrm{mL}(8.0 \mu \mathrm{M})$.
