#### Abstract

Nine new sesquiterpene pyridine alkaloids [wilfornines A (1), B (2), C (3), D (4), E (5), F (8), and G (9); wilfordinines I (6) and J (7)] and six known compounds (10-15) were isolated from a clinically used extract ( $T_{I I}$ ) of Tripterygium wilfordii. Thestructures of $1-9$ were elucidated by spectroscopic and chemical methods. The inhibitory effects on cytokine production of 1-3 and several related compounds were evaluated. Compounds $\mathbf{1 0}$ and $\mathbf{1 4}$ showed significant inhibitory effects on cytokine production.

Tripterygium wilfordii Hook f. (Celastraceae) has been used in traditional Chinese medicine to treat cancer and also as an insecticide for hundreds of years. Recently, an extract (the so-called 'total multi-glycoside" or " $\mathrm{T}_{\text {II }}$ extract") derived from a water and chloroform partitioning of the roots of T . wilfordii has been used in the dinical treatment of rheumatoid arthritis, skin disorders, male-fertility control, and other inflammatory and autoimmune diseases in China. ${ }^{1-3}$ In previous papers, we have reported a number of immunosuppressive diterpenes and anti-HIV sesquiterpenes from T. wilfordii. ${ }^{4,5}$ As a continuation of our studies on the bioactive principles from the genus Tripterygium, we have turned our attention to the immunosuppressive constituents and describe herein theisolation and structure determination of nine new (1-9) and six known sesquiterpene al kaloids (10-15) (Chart 1) from the clinically used extract of $T$. wilfordii ( $T_{\| I}$ extract), al ong with their inhibitory effects on cytokine production.

## Results and Discussion

The powdered $T_{I I}$ extract of $T$. wilfordii was chromatographed repeatedly on Si gel to afford nine new sesquiterpene alkaloids, named wilfornines A (1), B (2), C (3), D (4), E (5), F (8), and G (9) and wilfordinines I (6) and J (7), as well as six known compounds (10-15).

Wilfornine A (1) was assigned the molecular formula $\mathrm{C}_{45} \mathrm{H}_{51} \mathrm{O}_{20} \mathrm{~N}$ from its HRFABMS. Its IR spectrum showed hydroxyl and ester carbonyl bands ( 3483 and $1750 \mathrm{~cm}^{-1}$ ), and the UV spectrum revealed the presence of an aromatic ring (228 and 267 nm ). The ${ }^{1 \mathrm{H}}$ NMR (Table 1) data revealed the presence of six acetyl, one benzoyl (Bz), and four sets of methylene groups. In addition, seven methine protons and a 2,3 -substituted pyridine ring were detected. Due to the presence of seven ester groups and a pyridine ring, $\mathbf{1}$ was assumed to be a sesquiterpene alkaloid derivative, similar to the wilfordate-type sesquiterpenes. ${ }^{6,12}$ The ${ }^{13} \mathrm{C}$ NMR (Table 2) spectral data of $\mathbf{1}$ were very similar to those of wilfordine (16), ${ }^{7}$ except for the number of acetyl groups (1, six acetyls, one benzoyl; 16, five acetyls, one benzoyl) and the downfield shift of the carbon signal attributed to C-9' ( $\delta_{\mathrm{C}} 81.6$ ). In the HMBC spectrum of 1, the proton signals at $\delta_{\mathrm{H}} 5.50(\mathrm{H}-1), 5.19(\mathrm{H}-2), 6.85(\mathrm{H}-5)$,

[^0]$5.45(\mathrm{H}-7), 5.13(\mathrm{H}-8)$, and 4.43 (H-11b) correlated with the acetyl carbonyl carbon signals at $\delta_{c} 167.8,168.1,169.6$, 169.8, 168.5, and 170.1, respectively. Thus, the six acetyl groups were assigned at positions C-1, C-2, C-5, C-7, C-8, and $\mathrm{C}-11$, and the benzoyl group was located at position C-9'.
Benzoylation of alatusinine (18) ${ }^{8}$ with benzoyl chloride and a catalytic amount of 4,4-(dimethylamino)pyridine afforded a product identical to $\mathbf{1}$. In the NOESY spectrum of 1, the proton signal at $\delta_{\mathrm{H}} 5.15$ (H-11a) correlated with the signals at $\delta_{\mathrm{H}} 6.85(\mathrm{H}-5)$ and $1.54\left(\mathrm{H}_{3}-12\right)$, and the signal at $\delta_{\mathrm{H}} 5.50(\mathrm{H}-1)$ with the signals at $\delta_{\mathrm{H}} 5.19(\mathrm{H}-2)$ and 5.13 $(\mathrm{H}-8)$, while the signal at $\delta_{\mathrm{H}} 5.13(\mathrm{H}-8)$ correlated with the signals at $\delta_{H} 5.45(\mathrm{H}-7)$ and $1.14\left(\mathrm{H}_{3}-14\right)$. Thus, therelative configurations of the ester groups were determined as $1 \beta$, $2 \beta, 5 \alpha, 7 \beta$, and $8 \beta$. Therefore, the structure of 1 was assigned as $9^{\prime}$-benzoyloxyeuonine.

Wilfornine $\mathrm{B}(\mathbf{2}), \mathrm{C}_{43} \mathrm{H}_{49} \mathrm{O}_{19} \mathrm{~N}$, had five acetyl groups and one benzoyl group from its ${ }^{1} \mathrm{H}$ NMR spectrum. On the basis of comparison of its ${ }^{13} \mathrm{C}$ NMR data to those of 1, this compound could be assigned within the same structural type. A downfield carbon signal at position C-9' was apparent in comparison with ${ }^{13} \mathrm{C}$ NMR data of 18, and a proton signal at $\delta_{H} 5.25(\mathrm{H}-5)$ was apparent in a more upfield position than the same proton in 1 ( $\delta_{H} 6.85, \mathrm{H}-5$ ). Compound $\mathbf{2}$ was therefore deduced as be 5-deacetylwilfornine A (1). Acetylation of $\mathbf{2}$ in the usual way afforded $\mathbf{1}$. Thus, wilfornine B (2) was elucidated as 5-deacetyl-9'benzoyloxyeuonine.
Wilfornines C (3) and D (4) were assigned with the same structural framework as $\mathbf{1}$ and $\mathbf{2}$ from their ${ }^{13} \mathrm{C}$ NMR spectral data. The difference between these compounds was the nature of the ester groups and their positions. The HMBC spectral data of $\mathbf{3}$ indicated that the five acetyl groups were located at C-1, C-2, C-7, C-8, and C-11, and one of the benzoyl groups was at C-5. The remaining benzoyl group was located at C-9', as in the case of compounds $\mathbf{1}$ and 2. F or 4, the acetyl groups were assigned at positions C-1, C-2, C-5, C-7, C-8, and C-11. The furanoyl group was deduced to be located at C-9' from the downfield carbon signal at C-9'. Furanoylation of 18 afforded 4. Thus, the structures of wilfornine C (3) and D (4) were determined as $\mathrm{O}^{5}$-benzoyl-O5-deacetyl-9'-benzoyl oxyeuonine and 9 'furanoyloxyeuonine, respectively.

Wilfornine E (5) had a molecular formula $\mathrm{C}_{36} \mathrm{H}_{43} \mathrm{O}_{18} \mathrm{~N}$. Its ${ }^{13} \mathrm{C}$ NMR spectral data revealed the presence of a carbonyl carbon at $\delta_{\mathrm{C}} 196.7$ and different chemical shift

15
values for C-6, C-7, and C-8 than those of compounds 1-4 and $\mathbf{1 6}$ (Table 2). In the HMBC spectrum of 5, the proton signal at $\delta_{\mathrm{H}} 6.78(\mathrm{H}-5)$ correlated with the carbon signals at $\delta_{\mathrm{C}} 52.5$ (C-9), 95.5 (C-10), 86.5 (C-13), and 196.0 (C-7), and the proton signals at $\delta_{\mathrm{H}} 5.56(\mathrm{H}-8)$ and $3.05(\mathrm{H}-6)$ correlated with the carbonyl group ( $\delta_{\mathrm{C}}$ 196.0). Thus, compound 5 was characterized as 7-deacetoxy-7-oxoalatusinine.

Wilfordinine I (6) was assigned a molecular formula $\mathrm{C}_{48} \mathrm{H}_{51} \mathrm{O}_{19} \mathrm{~N}$ from HRFABMS. Its ${ }^{1} \mathrm{H}$ NMR spectrum (Table 1) showed four acetyl groups, two benzoyl groups, two oxygenated methylene groups, and a secondary methyl group coupled with a methine. Comparison of the ${ }^{13} \mathrm{C}$ NMR spectral data of 6 with those of 1-4 indicated that 6 contained a dihydroagarofuran unit linked to a pyridyl moiety (Table 2). The coupling pattern suggested that the pyridine unit in 6 is 3,4-substituted [ $\delta_{\mathrm{H}} 8.99$ (s), 8.71 and 7.80 (each $1 \mathrm{H}, \mathrm{d}, \mathrm{J}=5.4 \mathrm{~Hz}$ )]. Thus, compound 6 was

22

assumed to be an isomeric evoninate-type sesquiterpene similar to those found in T. hypoglaucum ${ }^{6}$ and Peritassa compta. ${ }^{17}$ Comparison of the ${ }^{13} \mathrm{C}$ NMR spectral data of 6 with those of hypoglaunine $C(21)^{6}$ indicated that the pyridyl moiety was a 2-hydroxy-2,3-dimethyl-3-(3'-carboxy-4'-pyridyl)propanoic acid unit. Furthermore, the proton signal at $\delta_{\mathrm{H}} 4.84(\mathrm{H}-3)$ correlated with the signal at $\delta_{\mathrm{C}} 175.2$ ( $\mathrm{C}-11^{\prime}$ ), and the proton signal at $\delta_{\mathrm{H}} 5.42$ ( $\mathrm{H}-15 \mathrm{a}$ ) with the signal at $\delta_{\mathrm{C}} 167.9$ (C-12'). These observations indicated that the pyridyl moiety was linked to the sesquiterpene unit at positions C-3 and C-15. In the same manner, two benzoyl groups were located at positions C-2 and C-5, and the four acetyl groups were assigned at C-1, C-7, C-8, and C-11, respectively. The stereochemistry of six ester groups was readily determined by the analysis of the NOESY spectrum as described for 1. Thus, wilfordininel (6) was formulated as $\mathrm{O}^{2}, \mathrm{O}^{5}$-di benzoyl-O22-deacetyl-O5-deacetyl-8'-hydroxyperitassine A .

${ }^{\text {a }} \mathrm{CDCl}_{3}$ was used as solvent, and TMS as internal standard.

Wilfordinine J (7), $\mathrm{C}_{36} \mathrm{H}_{45} \mathrm{O}_{17} \mathrm{~N}$, contained five acetyl groups, two secondary methyl groups, and two coupled methine protons. It also had a 3,4-disubstituted pyridine ring, as compound 6 . The ${ }^{13} \mathrm{C}$ NMR spectral data of 7 were similar to those of $\mathbf{6}$, except for the number and nature of the ester groups and chemical shift values of C-7', C-8', $\mathrm{C}-9$ ', and $\mathrm{C}-10^{\prime}$. The pyridyl unit was assumed to be an isomeric form of evoninate acid, which already has been reported from T. hypoglaucum. ${ }^{4}$ In the HMBC spectrum, the signal at $\delta_{\mathrm{H}} 8.98\left(\mathrm{H}-2^{\prime}\right)$ correlated with the carbon signals at $\delta_{C} 125.4$ ( $\mathrm{C}-3^{\prime}$ ), 156.3 ( $\mathrm{C}-4^{\prime}$ ), 152.9 ( $\mathrm{C}-6^{\prime}$ ), and 168.0 ( $\mathrm{C}-12^{\prime}$ ), the signal at $\delta_{\mathrm{H}} 1.07\left(\mathrm{H}-10^{\prime}\right)$ with the signals at $\delta_{C} 33.4$ ( $\mathrm{C}-7^{\prime}$ ), 45.7 ( $\mathrm{C}-8^{\prime}$ ), and 173.6 ( $\mathrm{C}-11^{\prime}$ ), and the signal at $\delta_{\mathrm{H}} 1.37\left(\mathrm{H}-9^{\prime}\right)$ with the signals at $\delta_{\mathrm{C}} 156.3\left(\mathrm{C}-4^{\prime}\right)$, 33.4 (C-7'), and 45.7 (C-8'). From above observations, the presence of a 2,3-dimethyl-3(3'-carboxy-4'-pyridyl)propanoic acid unit was determined. Furthermore, the proton signals at $\delta_{\mathrm{H}} 5.10(\mathrm{H}-2), 6.76(\mathrm{H}-5), 5.53(\mathrm{H}-7), 5.57(\mathrm{H}-8)$, and 5.11 (H-11a) correlated with the acetyl carbonyl carbon signals at $\delta_{C}$ 170.3, 169.9, 170.2, 169.9, and 169.8, respectively. Therefore, the five acetyl groups were located at C-2, C-5, C-7, C-8, and C-11. Thus, wilfordinineJ (7) was determined as $\mathrm{O}^{1}$-deacetyl peritassine A .

Wilfornine F (8) had a molecular formula of $\mathrm{C}_{41} \mathrm{H}_{47} \mathrm{O}_{17} \mathrm{~N}$. The ${ }^{1} \mathrm{H}$ NMR spectral data revealed four acetyl methyl groups, two secondary methyls, two coupled methine protons, and one benzoyl group, as well as a 2,3-substituted pyridine moiety [ $\delta_{\mathrm{H}} 8.70$ ( 1 H , dd, 4.7, 1.6), 7.26 ( 1 H , dd, $7.8,4.7$ ), and $8.04(1 \mathrm{H}, \mathrm{dd}, 7.8,1.6)]$. The ${ }^{13} \mathrm{C}$ NMR spectral data were similar to those of hyponine $D^{9}$ (11) except for the ester groups. In the HMBC spectrum, the proton signals at $\delta_{\mathrm{H}} 5.49(\mathrm{H}-1), 5.58(\mathrm{H}-7), 5.41(\mathrm{H}-8)$, and 4.73 ( $\mathrm{H}-11 \mathrm{a}$ ) correlated with the acetyl carbonyl signals at $\delta_{\mathrm{C}}$ 169.5, 170.4, 169.3, and 170.2, respectively. Thus, the positions of these four acetyl groups were assigned at C-1, $\mathrm{C}-7, \mathrm{C}-8$, and $\mathrm{C}-11$. Further, the proton signal at $\delta_{\mathrm{H}} 7.19$ ( $\mathrm{H}-5$ ) correlated with the benzoyl carbonyl carbon at $\delta_{\mathrm{C}}$ 166.0, so the benzoyl group was located at C-5. In the NOESY spectrum, the proton signal at $\delta_{\mathrm{H}} 5.34$ (H-11b) correlated with the signals at $\delta_{\mathrm{H}} 7.19(\mathrm{H}-5)$ and $1.60\left(\mathrm{H}_{3}-\right.$ 12), the signal at $\delta_{\mathrm{H}} 5.49(\mathrm{H}-1)$ with the signals at $\delta_{\mathrm{H}} 4.12$

Table 3. Inhibitory Effects of Compounds 1-3, 10-17, 19-22, and Prednisolone on Cytokine Productiona

|  | inhibition (\%) |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |

| $\mathbf{1 9}$ | 79 | 64 | 1 | 67 | 16 | 41 |
| $\mathbf{2 0}$ | 64 | 53 | 7 | 22 | -53 | 4 |
| $\mathbf{2 1}$ | -28 | 2 | -26 | 57 | 51 | 20 |
| $\mathbf{2 2}$ | 10 | 18 | 64 | 47 | 77 | 62 |
| prednisolone | 52 | 68 | 15 | 65 | 76 | 75 |

a F or protocols used, see Experimental Section. Concentrations used: 1-3, 10-17, 19-22, $10 \mu \mathrm{~g} / \mathrm{mL}$; prednisol one, $0.3 \mu \mathrm{~g} / \mathrm{mL}$.
( $\mathrm{H}-2$ ) and $5.41(\mathrm{H}-8)$, and the signal at $\delta_{\mathrm{H}} 5.41(\mathrm{H}-8)$ with the signals at $\delta_{H} 5.58(\mathrm{H}-7)$ and $1.69\left(\mathrm{H}_{3}-14\right)$. Thus, the relative configurations of the ester groups were determined as $1 \beta, 2 \beta, 5 \alpha, 7 \beta$, and $8 \beta$. Therefore, 8 was formulated as 7-(acetyloxy)-O5-benzoyl-O2-deacetyl-O5-deacetyl-7-deoxoevonine.

Wilfornine G (9), $\mathrm{C}_{42} \mathrm{H}_{48} \mathrm{O}_{18} \mathrm{~N}_{2}$, contained five acetyl groups and a nicotinoyl group [ $\delta_{H} 9.32$ (d, 1.5), 8.85 (dd, 4.8, 1.5), 8.38 (dt, 7.4, 1.5), 7.48 (dd, 7.4, 4.8)] from its ${ }^{1} \mathrm{H}$ NMR spectrum. It had the same skel eton as $\mathbf{8}$ by comparing the ${ }^{13} \mathrm{C}$ NMR spectral data of these two compounds (Table 2). The differences between 8 and 9 were the ester groups and their positions. By using the same strategy as above (the comparison of ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ NMR, and 2D NMR spectral data), the structure of wilfornine $G$ (9) was determined as 7-(nicotinoyloxy)-7-deoxoevonine.

Several known compounds were identified from their spectral data upon comparison with values reported in the literature as ebenifoline E-11 (10), ${ }^{10}$ hyponine D (11), ${ }^{9}$
mayteine (12), ${ }^{11}$ euonymine (13), ${ }^{12}$ congorinine E-1 (14), ${ }^{13}$ and triptonine A (15). ${ }^{14}$

In a screen for immunosuppressive agents from the $T_{\text {II }}$ extract of T . wilfrodii, we examined the inhibitory effect of isolated compounds and other reported compounds6,15 (16, 17, and 19-22, from the same origin) on cytokine production. The activities of those compounds with an inhibitory effect are shown in Table 3 (the other tested compounds were inactive in the test system). Compounds 10 and 14 showed a significant inhibitory effect on cytokine production from lipopolysaccharide (or phytohemaggluti-nin)-stimulated human peripheral mononuclear cells compared with the reference compound (prednisol one). ${ }^{16}$ Compounds 17 and 22 inhibited IL-4, IL-8, and IFN- $\gamma$ production, and 19 (isolated from the Tı extract) inhibited TNF- $\alpha$, IL$1 \beta$, and IL-2 production. The immunosuppressive activity of these known compounds has been determined for the first time.

## Experimental Section

General Experimental Procedures. Optical rotations were measured with a J asco DIP-370 digital polarimeter. UV spectra were run on an UV 2100 UV-vis recording spectrometer (Shimadzu). IR spectra were recorded on a 1720 infrared Fourier transform spectrometer (Perkin-EImer). NMR experiments were run on a Bruker ARX-400 instrument using TMS as internal standard. NMR spectra were recorded at 400 MHz $\left({ }^{1} \mathrm{H}\right)$ and $100 \mathrm{MHz}\left({ }^{13} \mathrm{C}\right)$. Mass spectra were obtained on a J EOL J MSD-300 instrument, matrix: magic/thiol2 [the mixture of magic (dithiothreitol-dithioerythritol, 3:1) and thio (thioglyserol), 1:2]. Column chromatography was performed using Si gel 60 (Merck). HPLC was carried out as follows: Si gel HPLC (Hibar RT 250-25, LiChrosorb Si 60), ODS (INERTSIL PREP ODS, $20.0 \times 250 \mathrm{~mm}$, GL Sciences Inc., Tokyo, J apan).

Plant Material. A powdered extract of T. wilfordii ( $\mathrm{T}_{\text {II }}$ ) was purchased in 1997 from the School of Pharmacy, Shanghai Medical University, Shanghai, People's Republic of China. This extract was prepared from the root xylem with water then with chloroform and by column chromatographic separation (Si gel, $\mathrm{CHCl}_{3}-\mathrm{MeOH}, 95: 5$ ). Samples of $\mathrm{T}_{\prime \prime}$ and the original plant (T. wilfordii, TW940930) are deposited in the Faculty of Pharmaceutical Sciences, University of Tokushima, J apan.

Extraction and Isolation. The extract ( $\mathrm{T}_{11}, 54 \mathrm{~g}$ ) prepared from T . wilfordii was chromatographed over a Si gel column ( $1.0 \mathrm{~kg}, 11 \times 90 \mathrm{~cm}$ ) and eluted with solvents of increasing polarity $\left[\mathrm{CHCl}_{3}-\mathrm{MeOH}(99: 2,95: 5,9: 1, \mathrm{MeOH})\right]$ to give 10 fractions (fractions 1-10). Fraction $3(0.7 \mathrm{~g}$ ) was chromatographed by medium-pressure liquid chromatography (MPLC) on a Si gel column ( $3 \times 35 \mathrm{~cm}$ ) with a hexane-EtOAc (hexaneEtOAc, 2:1, 1:2) system to give nine further fractions (fractions 3.1-3.9). Fraction 3.7 was separated by gel-permeation chromatography (eluting with MeOH ) and then Si gel HPLC to give 10 ( 8 mg ) and 14 ( 148 mg ). Fraction $4(7.5 \mathrm{~g})$ was chromatographed by MPLC on a Si gel column (hexanesEtOAc, 3:2, 1:2) to give 15 fractions (fractions 4.1-4.15). Fraction 4.12 was separated on ODS ( $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}, 8: 2$ ) to give $12(26 \mathrm{mg}), 13(133 \mathrm{mg})$, and another major fraction. This major fraction was further separated on HPLC (Si 60, $\mathrm{CHCl}_{3}-$ $\mathrm{MeOH}, 99: 1$ ) to give $\mathbf{1}(65 \mathrm{mg})$ and $\mathbf{1 5}$ ( 3 mg ). Fraction 4.13 was separated on ODS ( $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}, 8: 2$ ) to give $\mathbf{5}(5 \mathrm{mg})$, $\mathbf{1 1}$ ( 26 mg ), and another five fractions (fractions 4.13.1-4.13.5). Fraction 4.13 .3 was separated by HPLC ( $\mathrm{Si} 60, \mathrm{CHCl}_{3}-\mathrm{MeOH}$, 99:1) to give 4 ( 8 mg ) and 7 ( 4.5 mg ). Fraction 4.13 .4 was separated by HPLC (Si 60, $\mathrm{CHCl}_{3}-\mathrm{MeOH}, 99: 1$ ) to give 3 (14 $\mathrm{mg})$ and $8(4.5 \mathrm{mg})$. Fraction $5(16.5 \mathrm{~g})$ was chromatographed on a Si gel column ( $6 \times 80 \mathrm{~cm}$ ) by elution with hexanes-EtOAc (1:1, $1: 2,1: 4$ ) to give 12 further fractions (fractions 5.1-5.12). Fraction 5.9 was separated by ODS ( $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}, 8: 2$, then $7: 3)$ to give $2(23 \mathrm{mg}), 6(5 \mathrm{mg})$, and 9 ( 28 mg ).

Wilfornine $\mathbf{A}(\mathbf{1})$ : amorphous powder; $[\alpha]_{\mathrm{D}}-41.9^{\circ}$ (c 1.0, $\mathrm{MeOH}) ; \mathrm{UV}(\mathrm{MeOH}) \lambda_{\max }(\log \epsilon) 267$ (3.68), 228 (4.27) nm; IR
(KBr) $v_{\max } 3483,2361,1750,1577,1442,1375,1232,1135$, 1052, 755, $716 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$ ), see Table 1 and OBz$9^{\prime}, \delta 7.69(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.4 \mathrm{~Hz}$, ortho), 7.46 ( $1 \mathrm{H}, \mathrm{br} \mathrm{t}, \mathrm{J}=7.3 \mathrm{~Hz}$, para), $7.30\left(2 \mathrm{H}, \mathrm{dd}, \mathrm{J}=7.4,7.3 \mathrm{~Hz}\right.$, meta); $\left.{ }^{13} \mathrm{C} \mathrm{NMR} \mathrm{(CDCl}_{3}\right)$, see Table 2 and $\delta 20.1$, 167.8 (OAc-1), 21.4, 168.1 (OAc-2), 20.8, 169.6 (OAc-5), 20.9, 169.8 (OAc-7), 20.3, 168.5 (OAc-8), 21.2, 170.1 (OAc-11), 165.6, 129.6, 130.2, 127.9, 132.9 (OBz-9'); FABMS m/z $926[\mathrm{M}+\mathrm{H}]^{+}$; HRFABMS m/z $926.3048[\mathrm{M} \mathrm{+}$ $\mathrm{H}]^{+}$(calcd for $\mathrm{C}_{45} \mathrm{H}_{52} \mathrm{O}_{20} \mathrm{~N}, 926.3083$ ).
Benzoylation of 18. Compound 18 ( 10 mg , isol ated from T. wilfordii ${ }^{15}$ ) was dissolved in 1 mL of pyridine and a catalytic amount of 4,4-(dimethylamino)pyridine, and 1 mL of benzoyl chloride was added to the solution. The reaction mixture was stirred for 48 h at room temperature under $\mathrm{N}_{2}$. Workup gave 25 mg of residue, which was purified by HPLC (GPC, $\mathrm{CHCl}_{3}$ ) to give 7 mg of $\mathbf{1}$.

Wilfornine B (2): amorphous powder; $[\alpha]_{D}-17.8^{\circ}$ (c 0.8, $\mathrm{MeOH})$; UV (MeOH) $\lambda_{\text {max }}(\log \epsilon) 265$ (3.60), 228 (4.17) nm; IR (KBr) $v_{\max } 3423,2927,2362,1751,1453,1373,1231,1101$, 1047, $715 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right)$, see Table 1 and OBz-9', $\delta$ $7.78(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.3 \mathrm{~Hz}$, ortho), $7.50(1 \mathrm{H}, \mathrm{br} \mathrm{t}, \mathrm{J}=7.4 \mathrm{~Hz}$, para), $7.35\left(2 \mathrm{H}\right.$, br t, J $=7.5 \mathrm{~Hz}$, meta); ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right)$, see Table 2 and $\delta$ 20.1, 168.2 (OAc-1), 21.2, 168.3 (OAc-2), 21.4, 170.0 (OAc-7), 20.4, 168.7 (OAc-8), 21.0, 169.8 (OAc-11), 166.0, 129.6, 130.5, 128.1, 133.2 (OBz-9'); EIMS m/z 883 [M ] ${ }^{+}$(31), $824[\mathrm{M}-\mathrm{OAc}]^{+}(16), 810$ (39), 780 (12), 762 (66), 752 (22), 704 (22), 326 (16), 222 (13), 204 (53), 176 (53), 160 (31), 150 (15), 132 (25), 105 (100), 93 (24), 77 (13), 43 (23); HREIMS $\mathrm{m} / \mathrm{z} 883.2927$ [M ] (calcd for $\mathrm{C}_{43} \mathrm{H}_{49} \mathrm{O}_{19} \mathrm{~N}, 883.2899$ ).

Acetylation of $\mathbf{2}$. Compound $\mathbf{2}(1.5 \mathrm{mg})$ was treated with $\mathrm{Ac}_{2} \mathrm{O}(0.3 \mathrm{~mL})$ and $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}(0.5 \mathrm{~mL})$ at room temperature overnight. The reaction mixture on work up gave 1 (1 mg).
Wilfornine C (3): amorphous powder; $[\alpha]_{D}-50.0^{\circ}$ (c 1.1, $\mathrm{MeOH})$; UV (MeOH) $\lambda_{\text {max }}(\log \epsilon) 267$ (3.74), 231 (4.51) nm; IR (KBr) $v_{\text {max }} 3446,2923,2853,2362,1752,1722,1636,1453$, 1373, 1254, 1233, 1133, 1097, 1052, 1004, 904, 715; $\mathrm{cm}^{-1}{ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$ ), see Table 1 and OBz-5, $\delta 8.27(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.9$ Hz , ortho), 7.48 ( $2 \mathrm{H}, \mathrm{dd}, \mathrm{J}=7.9,7.4 \mathrm{~Hz}$, meta), 7.59 ( $1 \mathrm{H}, \mathrm{t}$, J $=7.4 \mathrm{~Hz}$, para), OBz-9: 7.71 (2H, d, J $=7.9 \mathrm{~Hz}$, ortho), 7.33 ( $2 \mathrm{H}, \mathrm{br} \mathrm{t}, \mathrm{J}=7.8 \mathrm{~Hz}$, meta), $7.49(1 \mathrm{H}, \mathrm{br} \mathrm{t}, \mathrm{J}=7.5 \mathrm{~Hz}$, para); ${ }^{13} \mathrm{C}$ NMR ( $\mathrm{CDCl}_{3}$ ), see Table 2 and $\delta 20.5,168.0$ (OAc-1), 21.1, 168.3 (OAc-2), 21.5, 170.1 (OAc-7), 20.3, 168.7 (OAc-8), 21.1, 170.1 (OAc-11), 165.7, 129.7, 130.4, 128.9, 133.7 (OBz-5), 165.7, 130.4, 129.4, 133.1, 128.1 (OBz-9'); EIMS m/z 987 [M ]+ (58), 866 (95), 822 (19), 754 (6), 675 (4), 616 (3), 326 (11), 253 (5), 176 (18), 105 (100), 28 (59); FABMS m/z 988 [M + H]+; HRFABMS m/z $988.3203[\mathrm{M}+\mathrm{H}]^{+}$(calcd for $\mathrm{C}_{50} \mathrm{H}_{54} \mathrm{O}_{20} \mathrm{~N}$, 988.3239).

Wilfornine $\mathbf{D}(4):$ amorphous powder; $[\alpha]_{D}-21.1^{\circ}$ (c 0.8 , $\mathrm{MeOH}) ; \mathrm{UV}(\mathrm{MeOH}) \lambda_{\text {max }}(\log \epsilon) 263$ (3.57), 216 (3.99) nm; IR (KBr) $v_{\text {max }} 3446,2925,2853,2374,1749,1635,1435,1372$, 1318, 1233, 1096, 1047, 1007, 875, $602 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$ ), see Table 1 and OFu-9', $\delta 6.51$ ( $1 \mathrm{H}, \mathrm{d}, \mathrm{J}=1.1 \mathrm{~Hz}$ ), $7.30(1 \mathrm{H}$, br s), $7.75(1 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}$ NMR ( $\mathrm{CDCl}_{3}$ ), see Table 2 and $\delta 20.2$, 168.3 (OAc-1), 20.9, 170.2 (OAc-2), 21.5, 170.0 (OAc-5), 21.0, 168.5 (OAc-7), 20.3, 168.9 (OAc-8), 21.3, 170.4 (OAc-11), 162.4, 118.7, 110.2, 143.3, 149.1 (OFu-9'); FABMS m/z 916 [M + H ] ${ }^{+}$; HRFABMS m/z $916.2858[\mathrm{M}+\mathrm{H}]^{+}$(calcd for $\mathrm{C}_{43} \mathrm{H}_{50} \mathrm{O}_{21} \mathrm{~N}$, 916.2875).

Preparation of 3-F uroyl Chloride. A mixture of 3-furoic acid ( 3 g ) and $\mathrm{SOCl}_{2}(5 \mathrm{~mL})$ in dry benzene ( 20 mL ) was stirred for 2 h under reflux. Excess $\mathrm{SOCl}_{2}$ was repeatedly removed by distillation with benzene at $100^{\circ} \mathrm{C}$. The reaction mixture was then concentrated to 5 mL under reduce pressure.

Esterification of $\mathbf{1 8}$ with 3-F uroyl Chloride. Compound 18 (10 mg) was dissolved in 5 mL of pyridine, and a catalytic amount of 4,4-(dimethylamino)pyridine and 1 mL of the reaction mixture prepared above were added to the sol ution. The reaction mixture was stirred for 18 h at room temperature under $\mathrm{N}_{2}$. The usual workup gave 18 mg of residue, which was purified by HPLC (GPC, $\mathrm{CHCl}_{3}$ ) to give 5 mg of 4 .
