# Determination of the Stereochemistry of the Tetrahydropyran Sesquineolignans Morinols A and B 

Satoshi Yamauchi, ${ }^{*, \dagger}$ Takuya Sugahara, ${ }^{\dagger}$ Koichi Akiyama, ${ }^{\ddagger}$ Masafumi Maruyama, ${ }^{\dagger}$ and Taro Kishida ${ }^{\dagger}$<br>Faculty of Agriculture, Ehime University, 3-5-7 Tarumi, Matsuyama, Ehime 790-8566, Japan, and Integrated Center for Sciences, Tarumi Station, Ehime University, 3-5-7 Tarumi, Matsuyama, Ehime 790-8566 Japan

Received September 18, 2006

The $7^{\prime}, 8^{\prime}$-stereochemistry of the tetrahydropyran sesquineolignans morinols A and B was determined as threo via synthetic studies and by comparison of NMR data of $7^{\prime}, 8^{\prime}$-threo-morinol and $7^{\prime}, 8^{\prime}$-erythro-morinol. This study also confirmed that the biosynthetic process produces enantiomeric mixtures of morinols A and B . This was ascertained by comparing the specific rotations of synthesized morinols A and B with those of naturally occurring morinols A and B.

The unique tetrahydropyran sesquineolignans morinols A and B have been isolated from the Chinese traditional medicinal plant Morina chinensis as a racemic mixture (Figure 1)..$^{1,2}$ The inhibition of cytokines by morinols A and B and the stronger activity of morinol B than morinol A have also been reported. ${ }^{2}$ This activity of lignans on cytokines is rare, even though many biological activities of naturally occurring lignans are known. ${ }^{3,4}$ The biosynthesis of enantiomeric lignans has also been reported. ${ }^{5}$ Therefore, the synthesis of optically pure lignans is important to determine their precise biological activity. The relationship between lignan structure and biological activity is complex because of numerous combinations of phenylpropanoid units and oxidation patterns. The synthesis and characterization of lignans ${ }^{6}$ are continuing to clarify which structural features of lignans determine biological activity. Morinols A and B were obtained as a racemic mixture from natural sources and used for biological research. The relative configuration of the $7^{\prime}$ and $8^{\prime}$ stereocenters are undefined. These facts persuaded us to synthesize optically pure morinols A and B to define their absolute configuration. The success of the synthetic study of morinols A and B would also contribute to research about the structure/activity relationship of tetrahydropyran sesquineolignans. Furthermore, the precise biological activity could be determined and new factors responsible for the biological activity of the novel structure would be clarified. A chiral secondary benzyl alcohol adjacent to another chiral carbon is common in lignan structures. ${ }^{4}$ These functionalities occur in both erythro and threo forms. However, the determination of the relative configuration is problematic. Thus syntheses of $7^{\prime}, 8^{\prime}$-threo-morinols A and B and $7^{\prime}, 8^{\prime}$ -erythro-morinols A and B were performed to determine their stereochemistries.

## Results and Discussion

The synthetic plan is shown in Figure 2. The tetrahydropyran ring was obtained by $S_{N} 2$ etherification between the benzyl alcohol and primary mesylate. The C-7 chiral carbon was constructed by a Grignard reaction. The C-8 chiral carbon was asymmetrically introduced by allylation using Evans' chiral auxiliary. The selection of morinol A ( $8,8^{\prime}$-cis) type or morinol B ( $8,8^{\prime}$-trans) type was achieved by $S$ or $R$ Evans' auxiliary before this allylation. The stereocontrol of erythro or threo between C-7' and C-8' was achieved by an Evans' $s y n^{7}$ or $a n t i^{8}$ selective aldol condensation, respectively. This synthetic strategy could be readily applied to morinol A and B derivatives. Thus, the introduction of a $3^{\prime \prime}, 4^{\prime \prime}-$ dimethoxyphenyl group at $\mathrm{C}-7^{\prime \prime}$ using a Pd catalyst was planned.

Figure 1. Morinol A and morinol B were isolated as enantiomeric mixtures. ${ }^{1,2}$

Figure 2. Synthetic plan of morinols A and B.
This article shows the determination of the stereochemistry of both morinols A and B by their first in vitro synthesis. A new example of lignan biosynthesis as an enantiomeric mixture is also confirmed by comparison of the specific rotations of synthesized morinols A and B with those of previously isolated morinols A and B. ${ }^{1,2}$

The plan for the construction of the tetrahydropyran structure 17, which has the $7^{\prime}, 8^{\prime}$-threo-morinol B configuration, required the synthesis of substrate $\mathbf{1 5}$ (Scheme 1). The chiral carbons of $\mathbf{1 5}$ were introduced by Evans' anti-aldol ${ }^{8}$ condensation, allylation by employing Evans' chiral auxiliary, and a Grignard reaction. The Evans' anti-aldol condensation between 3 and 3,4-dimethoxybenzaldehyde employing $\mathrm{Et}_{3} \mathrm{~N}$, chlorotrimethylsilane, and $\mathrm{MgCl}_{2}$ gave 4 (93\% yield), which was transformed to silyl ether 5 by using

${ }^{a}$ (a) 5-hexenoic acid, $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{PivCl}, \mathrm{THF}, 0{ }^{\circ} \mathrm{C}, 1 \mathrm{~h}$, then lithium salt of (S)-4-benzyl-2-oxazolidinone, THF, from -70 to $0{ }^{\circ} \mathrm{C}, 1 \mathrm{~h}$ ( $80 \%$ yield); (b) (1) $\mathrm{Et}_{3} \mathrm{~N}$, $\mathrm{TMSCl}, \mathrm{MgCl}_{2}, 3,4$-dimethoxybenzaldehyde, EtOAc, rt, 16 h ; (2) TFA, MeOH, rt, 30 min ( $93 \%$ yield); (c) TIPSOTf, 2,6-lutidine, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{rt}, 1 \mathrm{~h}$ ( $91 \%$ yield); (d) $\mathrm{LiBH}_{4}, \mathrm{MeOH}, \mathrm{THF}, \mathrm{rt}, 6 \mathrm{~h}\left(60 \%\right.$ yield); (e) TrCl, DMAP, $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}, 60^{\circ} \mathrm{C}, 16 \mathrm{~h}\left(81 \%\right.$ yield); (f) (1) $\mathrm{OsO}_{4}$, NMO, aq acetone, tert-BuOH, rt, 16 h ; (2) $\mathrm{NaIO} 4, \mathrm{MeOH}$, $\mathrm{rt}, 3 \mathrm{~h}$; (3) 2-methyl-2-butene, $\mathrm{NaH}_{2} \mathrm{PO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}, \mathrm{NaClO}_{2}$, aq tert- $\mathrm{BuOH}, \mathrm{rt}, 1 \mathrm{~h}\left(86 \%\right.$ yield); (g) $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{PivCl}, 0{ }^{\circ} \mathrm{C}, 1 \mathrm{~h}$, then lithium salt of ( S )-4-benzyl-2-oxazolidinone, from -70 to $0^{\circ} \mathrm{C}$, $1 \mathrm{~h}\left(88 \%\right.$ yield); (h) KHMDS, allyl bromide, THF, from $-70^{\circ} \mathrm{C}$ to $\mathrm{rt}, 16 \mathrm{~h}$ ( $50 \%$ yield); (i) $\mathrm{LiBH}_{4}, \mathrm{MeOH}$, THF, rt, $1 \mathrm{~h}(89 \%$ yield); (j) PCC, MS $4 \AA, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, rt, $16 \mathrm{~h}\left(76 \%\right.$ yield); (k) $3,4-(\mathrm{MeO})_{2} \mathrm{PhMgBr}$, THF, rt, $1 \mathrm{~h}\left(93 \%\right.$ yield); (1) (1) $\mathrm{Ac}_{2} \mathrm{O}, \mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}$, rt, 16 h ; (2) $\mathrm{HCO}_{2} \mathrm{H}$, ether, $-5{ }^{\circ} \mathrm{C}, 10 \mathrm{~min}(14: 35 \%$ yield, 15: $38 \%$ yield); (m) (1) $\mathrm{MsCl}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 0^{\circ} \mathrm{C}, 30 \mathrm{~min}$; (2) $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{MeOH}$, rt, 16 h ; (3) $\mathrm{NaH}, \mathrm{DMF}, \mathrm{rt}, 16 \mathrm{~h}$ ( $70 \%$ yield); (n) (1) $\mathrm{MsCl}^{\circ}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 0{ }^{\circ} \mathrm{C}, 30$ $\min$; (2) $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{MeOH}$, rt, $16 \mathrm{~h}\left(56 \%\right.$ yield); (o) $1-\mathrm{Br}-3,4-(\mathrm{MeO})_{2} \mathrm{C}_{6} \mathrm{H}_{3}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}, \mathrm{DMF}, 9{ }^{\circ} \mathrm{C}, 6 \mathrm{~h}(33 \%$ yield, recovered $\mathbf{1 7}, 58 \%)$; (p) $n-\mathrm{Bu} 4 \mathrm{NF}, \mathrm{THF}$, rt, 3 h ( $100 \%$ yield).
triisopropylsilyl triflate and 2,6-lutidine. The trityl ether 7 was obtained by reductive $\left(\mathrm{LiBH}_{4}\right)$ removal of the chiral auxiliary of $\mathbf{5}$ ( $60 \%$ yield) followed by treatment with trityl chloride in pyridine ( $81 \%$ yield). To introduce the Evans' chiral auxiliary, olefin 7 was converted to carboxylic acid $\mathbf{8}$ by $\mathrm{OsO}_{4}$ oxidation, then $\mathrm{NaIO}_{4}$ oxidation and then $\mathrm{NaClO}_{2}$ oxidation ( $86 \%$ yield, three steps). Attachment of $S$-Evans' chiral auxiliary to carboxylic acid 8 was achieved by coupling of the pivaloic anhydride of carboxylic acid $\mathbf{8}$ with the lithium salt of ( $S$ )-4-benzyl-2-oxazolidinone in $88 \%$ yield. The stereoselective allylation to 9 was accomplished by employing potassium bis(trimethylsilylamide) and allyl bromide to give $\mathbf{1 0}$ ( $50 \%$ yield) as a single isomer. Formation of the other stereoisomer was not observed. Since the $\alpha$-allylation to the lactone, which was obtained from 8 by detritylation, gave the diallyl compound, allylation using a chiral auxiliary was adopted. The allylation using sodium bis(trimethylsilylamide) did not give the allyl product. Reductive $\left(\mathrm{LiBH}_{4}\right)$ removal of the chiral auxiliary of $\mathbf{1 0}$ ( $89 \%$ yield) followed by pyridinium chlorochromate oxidation ( $76 \%$ yield) gave aldehyde 12. Treatment of aldehyde 12 with 3,4-dimethoxyphenylmagnesium bromide gave benzyl alcohol $\mathbf{1 3}$ as a $1: 1$ mixture of diastereomers in $93 \%$ yield. Detritylation of $\mathbf{1 3}$ using formic acid in ether was accompanied by desilylation, giving the corresponding triol. However, detritylation of acetate of $\mathbf{1 3}$ gave separable alcohols 14 (35\% yield) and 15 (38\% yield). At this stage, the cyclization of the substrate to tetrahydropyran was obtained. The configurations of $\mathbf{1 4}$ and $\mathbf{1 5}$ were not determined at this stage. After conversion of $\mathbf{1 5}$ to the corresponding mesylate by using $\mathrm{MeSO}_{2} \mathrm{Cl}$ and $\mathrm{Et}_{3} \mathrm{~N}$, the resulting crude mesylate was exposed to $\mathrm{K}_{2} \mathrm{CO}_{3}$ in MeOH , giving tetrahydropyran 17 in $56 \%$ yield.

The next key step involved formation of the cinnamyl compound by the coupling of aryl halide with olefin employing a Pd catalyst.

The Mizorogi-Heck reaction is known to couple an aryl halide with a conjugate olefin or enol using Pd catalysis. However, olefin 17 is not a conjugate olefin. This case is not typical of coupling reactions using Pd catalysts. Cesati et al. have reported Pd catalytic coupling reactions between aryl bromide and ethylene using $\mathrm{PdCl}_{2-}$ $\left(\mathrm{PPh}_{3}\right)_{2} .{ }^{9}$ The $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}$-catalyzed coupling reaction between 1-bromo-3,4-dimethoxybenzene and olefin 17 was carried out in DMF at $90^{\circ} \mathrm{C}$, giving trans-olefin 18 in $33 \%$ yield. A $58 \%$ portion of olefin $\mathbf{1 7}$ was recovered. Only the trans-olefin showing a coupling constant of 16.1 Hz for $\mathrm{H}-7^{\prime \prime}$ and $\mathrm{H}-8^{\prime \prime}$ was obtained. The formation of cis-olefin was not observed. The coupling constant of H-7 of $\mathbf{1 8}$ ( 9.3 Hz , diaxial) became clear at this stage, showing the trans-configuration of the $\mathrm{C}-7-\mathrm{C}-8$ bond. To compare the coupling constant of $\mathrm{H}-7$, the 7,8 -cis-compound 16 was prepared from Grignard product $\mathbf{1 4}$ by mesylation and deacetylation followed by treatment with sodium hydride in DMF. The H-7 coupling constant of the 7,8-cis-compound 16 was 2.0 Hz (axial-equatorial). Finally, desilylation of $\mathbf{1 8}$ by treatment with TBAF gave (+)morinol B in quantitative yield. NMR data agreed with those in the literature. ${ }^{1,2}(-)$-Morinol B was also synthesized from $(R)-3$ by almost the same synthetic method. In the step for introduction of a chiral auxiliary before allylation, $(R)$-Evans' chiral auxiliary was employed. These facts mean that the relative configuration of the $\mathrm{C}-7^{\prime}-\mathrm{C}-8^{\prime}$ bond of naturally occurring morinol B is threo. The specific rotations of synthesized $(+)$ - and $(-)$-morinol B were +69 and -69 , respectively. On the other hand, specific rotation of isolated morinol B was reported as -3.92. . $^{1,2}$ This shows that morinol B was biosynthesized as an enantiomeric mixture. The enantiomeric excess of synthesized $(+)$ - and $(-)$-morinol B was established as more than $99 \%$ each by HPLC analysis using a chiral column.

Scheme 2. Synthesis of Morinol $\mathrm{A}^{a}$

${ }^{a}$ (a) $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{PivCl}, 0^{\circ} \mathrm{C} 1 \mathrm{~h}$, then lithium salt of (R)-4-benzyl-2-oxazolidinone, from -70 to $0{ }^{\circ} \mathrm{C}, 1 \mathrm{~h}\left(83 \%\right.$ yield); (b) KHMDS, allyl bromide, THF, from $-70{ }^{\circ} \mathrm{C}$ to rt, $16 \mathrm{~h}\left(59 \%\right.$ yield); (c) $\mathrm{LiBH}_{4}, \mathrm{MeOH}, \mathrm{THF}, \mathrm{rt}, 1 \mathrm{~h}\left(90 \%\right.$ yield); (d) PCC, MS $4 \AA, \mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{rt}, 16 \mathrm{~h}\left(100 \%\right.$ yield); (e) $3,4-(\mathrm{MeO})_{2} \mathrm{PhMgBr}, \mathrm{THF}, \mathrm{rt}, 1 \mathrm{~h}(23: 28 \%$ yield, 24: $26 \%$ yield); (f) (1) $\mathrm{Ac}_{2} \mathrm{O}, \mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}, \mathrm{rt}, 16 \mathrm{~h}$; (2) $\mathrm{HCO}_{2} \mathrm{H}$, ether, $-5{ }^{\circ} \mathrm{C}, 10 \mathrm{~min}\left(\mathbf{2 5}: 58 \%\right.$ yield, 26: $59 \%$ yield); (g) (1) $\mathrm{MsCl}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{Ch}_{2} \mathrm{Cl}_{2}, 0{ }^{\circ} \mathrm{C}, 30 \mathrm{~min}$; (2) $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{MeOH}, \mathrm{rt}, 16 \mathrm{~h}$; (3) NaH , DMF, rt, 16 h ( $95 \%$ yield); (h) (1) $\mathrm{MsCl}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 0{ }^{\circ} \mathrm{C}, 30 \mathrm{~min}$; (2) $\mathrm{K}_{2} \mathrm{CO}_{3}$, MeOH, rt, 16 h ( $54 \%$ yield); (i) $n$ - $\mathrm{Bu}{ }_{4} \mathrm{NF}$, THF, rt, $3 \mathrm{~h}(94 \% \text { yield); (j) 1-Br-3,4-(MeO) })_{2} \mathrm{C}_{6} \mathrm{H}_{3}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}, \mathrm{DMF}, 9{ }^{\circ} \mathrm{C}, 6 \mathrm{~h}(31 \%$ yield, recovered 29, $67 \%)$.

To synthesize $7^{\prime}, 8^{\prime}$-threo-morinol A, carboxylic acid 8 was selected as a starting material (Scheme 2). After attachment of $R$-Evans' chiral auxiliary, the resulting compound 19 was converted to Grignard products 23 and 24. Compound 24 was transformed to allyl tetrahydropyran 29 to examine the olefin coupling reaction using an olefin without a silyl group. The coupling reaction of olefin 29 with 1-bromo-3,4-dimethoxybenzene using $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ gave ( - )-morinol A (31\% yield) and recovered olefin 29 (67\%). NMR data agreed with those in the literature. ${ }^{1,2}(+)$-Morinol A was also synthesized by the same method. It was confirmed that the relative configuration of the $\mathrm{C}-7^{\prime}-\mathrm{C}-8^{\prime}$ bond of naturally occurring morinol A is also the threo form and morinol A is biosynthesized as an enantiomeric mixture. The specific rotations of synthesized (+)and ( - )-morinol A were +15 and -15 , respectively. On the other hand, the specific rotation of isolated morinol B was reported as $+0.98 .{ }^{1,2}$ The HPLC analysis using a chiral column showed that the enantiomeric excess of synthesized $(+)$ - and $(-)$-morinol A was more than $99 \%$ ee.

To ensure the stereochemistry of morinols A and $\mathrm{B},(-)-7^{\prime}, 8^{\prime}-$ erythro-morinols A (31) and B (32) were synthesized from Evans' syn aldol product $\mathbf{3 0}$ (Scheme 3). The ${ }^{13} \mathrm{C}$ NMR spectrum of (+)$7^{\prime}, 8^{\prime}$-erythro-morinol B (32) was different from that of $(+)-7^{\prime}, 8^{\prime}-$ threo-morinol B (2); however, the ${ }^{13} \mathrm{C}$ NMR spectrum of ( - )-7 $7^{\prime}, 8^{\prime}-$ erythro-morinol A (31) was similar to that of ( - )- $7^{\prime}, 8^{\prime}$-threomorinol A (1). A clear difference between the $7^{\prime}, 8^{\prime}$-threo and $7^{\prime}, 8^{\prime}$ erythro isomers was observed in the chemical shifts of $\mathrm{H}_{2}-9, \mathrm{H}-7^{\prime \prime}$, and $\mathrm{H}-8^{\prime \prime}$. The $\mathrm{H}_{2}-9^{\prime}$ of the $7^{\prime}, 8^{\prime}$-threo isomers (morinol A: 3.42 and 4.38 ppm ; morinol B: 3.74 and 4.50 ppm ) resonates at lower field than that of the $7^{\prime}, 8^{\prime}$-erythro isomers (morinol A: 3.28 and $3.84-3.89 \mathrm{ppm}$, morinol B: 3.64 and $3.86-3.92 \mathrm{ppm}$ ). Both H-7" and $\mathrm{H}-8^{\prime \prime}$ of the $7^{\prime}, 8^{\prime}$-threo isomers (morinol A: H-7', 6.09 ppm , $\mathrm{H}-8^{\prime \prime}, 5.71 \mathrm{ppm}$; morinol B: H-7", $6.08 \mathrm{ppm}, \mathrm{H}-8^{\prime \prime}, 5.69 \mathrm{ppm}$ ) resonate at higher field than those of the $7^{\prime}, 8^{\prime}$-erythro isomers
(morinol A: H-7", $6.17 \mathrm{ppm}, \mathrm{H}-8^{\prime \prime}, 5.85 \mathrm{ppm}$; morinol B: H-7", $\left.6.19 \mathrm{ppm}, \mathrm{H}-8^{\prime \prime}, 5.87 \mathrm{ppm}\right)$. The coupling constants of $\mathrm{H}-7^{\prime}$ of the $7^{\prime}, 8^{\prime}$-threo isomers (morinol A: 9.1 Hz; morinol B: 9.0 Hz ) were larger than those of the $7^{\prime}, 8^{\prime}$-erythro isomers (morinol A: 7.3 Hz ; morinol B: 8.5 Hz ).

The stereochemistry of naturally occurring tetrahydropyran sesquineolignans morinols A and B was determined as $7^{\prime}, 8^{\prime}$-threo by enantioselective syntheses of ( + )- and ( - -morinols A and B. The syntheses of the $7^{\prime}, 8^{\prime}$-erythro isomer permitted the comparison of chemical shifts. This research will contribute to biosynthetic and biological research on neolignans.

## Experimental Section

General Experimental Procedures. Melting points were not corrected. Optical rotations were measured on a Horiba SEPA-200 instrument. NMR data were obtained using a JNM-EX400 spectrometer. EIMS data were measured with a JMS-MS700V spectrometer. The silica gel used was Wakogel C-300 (Wako, 200-300 mesh). HPLC analysis was performed with Shimadzu LC-6AD and SPD-6AV instruments. The numbering of compounds follows IUPAC nomenclatural rules.
(S)-4-Benzyl-3-(5-hexenoyl)-2-oxazolidinone (3). To a solution of 5-hexenoic acid ( $8.43 \mathrm{~mL}, 0.071 \mathrm{~mol}$ ) in THF ( 200 mL ) were added $\mathrm{Et}_{3} \mathrm{~N}(9.90 \mathrm{~mL}, 0.071 \mathrm{~mol})$ and pivaloyl chloride $(8.74 \mathrm{~mL}, 0.071 \mathrm{~mol})$ at $-70^{\circ} \mathrm{C}$, and then the mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 1 h . After cooling to $-70{ }^{\circ} \mathrm{C}$, a solution of the lithium salt of $(S)$-4-benzyl-2oxazolidinone prepared from ( $S$ )-4-benzyl-2-oxazolidinone ( 12.5 g , 0.071 mol ) and $n-\mathrm{BuLi}(1.6 \mathrm{M}$ in THF, $44.4 \mathrm{~mL}, 0.071 \mathrm{~mol})$ at -70 ${ }^{\circ} \mathrm{C}$ in THF ( 150 mL ) was added, and then the reaction mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 1 h . After addition of a saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution, the solution was separated, washed with brine, and dried ( $\mathrm{Na}_{2}-$ $\mathrm{SO}_{4}$ ). Concentration followed by silica gel column chromatography (EtOAc/hexane, 1:3) gave acyloxazolidinone $\mathbf{3}(15.6 \mathrm{~g}, 0.057 \mathrm{~mol}, 80 \%)$ as a colorless oil: $[\alpha]^{20}{ }_{\mathrm{D}}+69\left(c \quad 0.3, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta$
