Received January 23, 2008

#### Abstract

A chemical study on the seeds of Celastrus orbiculatus has led to the isolation of nine new ( $\mathbf{1} \mathbf{- 9}$ ) and 13 known dihydro- $\beta$-agarofuran derivatives. The identification and structural elucidation of the new compounds were based on spectroscopic data analysis, and the absolute configurations of compounds $\mathbf{1 - 6 , 8 - 1 0}$, and 16, as well as derivatives 2a and 6a, were determined by CD studies or by chemical methods. All compounds isolated were evaluated for cytotoxic activity against HL-60 human leukemia cells.

Celastrus orbiculatus Thunb. (Celastraceae) is a perennial shrub that has been used in Chinese folk medicine as a treatment for rheumatoid arthritis and bacterial infections. ${ }^{1}$ The family Celastraceae is well known for producing various dihydro- $\beta$-agarofuran derivatives, which have attracted much interest due to their broad range of biological activities such as insecticidal, ${ }^{2}$ reversal of the multidrug resistance (MDR) phenotype,,${ }^{3,4}$ cytotoxic, ${ }^{5}$ antitumorpromoting, ${ }^{6}$ antitubercular, ${ }^{7}$ immunosuppressive, ${ }^{8}$ and anti-inflammatory effects. ${ }^{9}$ As part of an ongoing search for new bioactive metabolites from plants used in traditional Chinese medicine, a chemical investigation has been undertaken on the seeds of $C$. orbiculatus. Herein, we report the isolation and structural elucidation of nine new sesquiterpenes ( $\mathbf{1} \mathbf{- 9}$ ) and 13 known secondary metabolites, along with their cytotoxic activity against HL-60 human leukemia cells.

## Results and Discussion

Powdered, air-dried seeds of C. orbiculatus ( 10.0 kg ) were extracted with $95 \% \mathrm{EtOH}$ at room temperature ( $3 \times 72 \mathrm{~h}$ ). After removal of solvent, the aqueous residue was partitioned in sequence

[^0]with petroleum ether and EtOAc, yielding petroleum ether and EtOAc fractions. The two fractions were subjected to a series of chromatographic steps to afford nine new dihydro- $\beta$-agarofuran derivatives ( $\mathbf{1 - 9}$ ) and 13 known metabolites.

Compound 1, isolated as a white, amorphous powder, showed an accurate $[\mathrm{M}+\mathrm{Na}]^{+}$ion at $\mathrm{m} / \mathrm{z} 629.2727$ in the HRESIMS, corresponding to the molecular formula $\mathrm{C}_{35} \mathrm{H}_{42} \mathrm{O}_{9} \mathrm{Na}$. It displayed IR absorptions indicative of the presence of ester groups at 1743 and $1727 \mathrm{~cm}^{-1}$. The UV spectrum exhibited an absorption maximum at 274 nm , which suggested the existence of aromatic moieties. ${ }^{7}$ The ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{1}$ (Table 1) indicated the presence of signals due to one acetyl group at $\delta 2.12(3 \mathrm{H}, \mathrm{s})$, two benzoyl groups at $\delta 7.61(2 \mathrm{H}, \mathrm{d}, J=7.4 \mathrm{~Hz}), 6.92(2 \mathrm{H}, \mathrm{t}, J=7.4$ $\mathrm{Hz}), 7.18(1 \mathrm{H}, \mathrm{t}, J=7.4 \mathrm{~Hz})$, and $7.59(2 \mathrm{H}, \mathrm{d}, J=7.4 \mathrm{~Hz}), 7.10$ $(2 \mathrm{H}, \mathrm{t}, J=7.4 \mathrm{~Hz})$, and $7.32(1 \mathrm{H}, \mathrm{t}, J=7.4 \mathrm{~Hz})$, respectively, and also signals of a butyrate group at $\delta 0.88(3 \mathrm{H}, \mathrm{t}, J=7.6 \mathrm{~Hz}), 1.62$ $(2 \mathrm{H}, \mathrm{m})$, and $2.34(2 \mathrm{H}, \mathrm{t}, J=7.6 \mathrm{~Hz})$, with those assignments supported by ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY and HMBC correlations (Figure 1). In addition, resonances belonging to acylated oxymethine protons at $\delta 5.96(1 \mathrm{H}, \mathrm{s}), 5.67(1 \mathrm{H}, \mathrm{d}, J=4.6 \mathrm{~Hz}), 5.54(1 \mathrm{H}, \mathrm{dd}, J=11.2$, $4.0 \mathrm{~Hz})$, and $5.52(1 \mathrm{H}, \mathrm{brs})$, two sets of typical methylene protons at $\delta 1.80$ and 1.78 (both $1 \mathrm{H}, \mathrm{m}$ ), and $\delta 2.20$ and $1.48(1 \mathrm{H}, \mathrm{m}$, each), and four characteristic methyl groups appearing as a doublet at $\delta 1.10(3 \mathrm{H}, \mathrm{d}, J=7.2 \mathrm{~Hz})$ and three singlets at $\delta 1.44,1.59$, and $1.61\left(3 \mathrm{H}, \mathrm{s}\right.$, each) were also observed. The ${ }^{13} \mathrm{C}$ NMR spectrum of 1 (Table 2 ) indicated 35 carbon signals separated by DEPT experiments into four carbonyls at $\delta 172.3,169.9,165.5$, and 164.8 , three quaternary $\mathrm{sp}^{3}$ carbons with two linked to an oxygen atom, two quaternary $\mathrm{sp}^{2}$ carbons, 16 tertiary carbons comprising six $\mathrm{sp}^{3}$ carbons with four linked to an oxygen atom and $10 \mathrm{sp}^{2}$ carbons, four secondary $\mathrm{sp}^{3}$ carbons, and six methyl carbons. The complete assignments of the protonated carbons were made from the HSQC spectrum, while a detailed analysis of the ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY and HMBC spectra of $\mathbf{1}$ led to the establishment of a tetrasubstituted dihydroagarofuran sesquiterpene for the structure of $\mathbf{1}$ (Figure 1). The regiosubstitution of the ester functions was determined by HMBC correlations of the carbonyl signals of the benzoate groups at $\delta$ 164.8 and 165.5 with signals at $\delta 5.67(\mathrm{H}-9)$ and $5.54(\mathrm{H}-1)$ and of the carbonyl signal of the acetate group at $\delta 169.9$ with the signal at $\delta 5.96$ (H-6), while the carbonyl signal of the butyrate group at $\delta 172.3$ correlated with the signal at $\delta 5.52$ (H-8). The relative configuration of 1 was established on the basis of a ROESY experiment (Figure 2), in which NOE effects were found between Me-14 and H-6 and Me-15, between H-2" ( $\delta 1.62$ ) of the C-8 butyrate group and H-6, between Me-12 and H-8 and H-9, and between H-9 and H-1. The absolute configuration of $\mathbf{1}$ was confirmed by the dibenzoate chirality method, an extension of the circular dichroism exciton chirality method, ${ }^{10}$ which showed a Davidoff-type split curve with a first Cotton effect at 239.7 nm

Figure 1. Main ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ long-range correlation $\left({ }^{1} \mathrm{H} \curvearrowright{ }^{13} \mathrm{C}\right)$ and ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ correlation (-) signals in the HMBC and COSY spectra of $\mathbf{1}, \mathbf{2}, \mathbf{6}$, and $\mathbf{8}$.
and a second one at 223.3 nm , due to the couplings of the two benzoate chromophores at $\mathrm{C}-1 \alpha$ and $\mathrm{C}-9 \alpha$. Thus, the structure and absolute configuration of $\mathbf{1}$ were assigned as $(1 S, 4 R, 5 S, 6 R, 7 R, 8 R, 9 S, 10 S)$ -6-acetoxy-1,9-dibenzoyloxy-8-butyryloxydihydro- $\beta$-agarofuran.

Compound 2, purified as a white, amorphous powder, gave the molecular formula $\mathrm{C}_{26} \mathrm{H}_{34} \mathrm{O}_{8}$, as deduced from the HRESIMS and NMR analysis. The NMR data (Tables 1 and 2) of $\mathbf{2}$ revealed $\mathbf{2}$ was very similar to those of $\mathbf{1}$ except that one benzoate group at $\mathrm{C}-1$ in $\mathbf{1}$ was displaced by one free hydroxyl group in $\mathbf{2}$, and one additional acetate group at C-8 in $\mathbf{2}$ appeared, instead of one butyrate group in $\mathbf{1}$. The HMBC experiment (Figure 1) established the regiosubstitution in the molecule of $\mathbf{2}$, and the relative configuration was resolved by analysis of a ROESY experiment (Figure 2). Thus compound $\mathbf{2}$ was assigned as the 8 -acetoxy-1-debenzoyl derivative of $\mathbf{1}$. To determine the absolute configuration of $\mathbf{2}$, it was necessary to introduce another chromophoric group. Benzoylation of $\mathbf{2}$ yielded the benzoate derivative, $\mathbf{2 a}$, which was suitable for applying the dibenzoate chirality method. ${ }^{10}$ Its $C D$ spectrum showed a split curve with a first negative Cotton
effect at 241.4 nm and a second positive effect at 221.7 nm . Therefore, 2 was established as ( $1 S, 4 R, 5 S, 6 R, 7 R, 8 R, 9 S, 10 S$ )-6,8-diacetoxy-9-benzoyloxy-1-hydroxydihydro- $\beta$-agarofuran.

Compounds 3 and $\mathbf{4}$ were assigned the molecular formulas $\mathrm{C}_{24} \mathrm{H}_{32} \mathrm{O}_{7}$ and $\mathrm{C}_{36} \mathrm{H}_{38} \mathrm{O}_{8}$, respectively, as deduced from their HRESIMS and NMR data. The NMR spectroscopic data (Tables 1 and 2) revealed that compounds $\mathbf{3}$ and $\mathbf{4}$ both possessed an identical dihydro- $\beta$-agarofuran skeleton to that of $\mathbf{2}$. A difference in the ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{3}$ was due to an additional hydroxyl group at C-8 instead of an acetate group in $\mathbf{2}$. Thus, $\mathbf{3}$ was determined as the 8 -deacetyl derivative of $\mathbf{2}$. Similarly, the ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of $\mathbf{4}$ corresponded to those of $\mathbf{2}$ except that two additional benzoate groups signals appeared in $\mathbf{4}$, and no acetate group signals were present. An analysis of the NMR spectra of 4 revealed that $\mathbf{4}$ is the 1,8-dibenzoyloxy-6-hydroxy derivative of $\mathbf{2}$. The relative configurations of compounds $\mathbf{3}$ and $\mathbf{4}$ were resolved by analysis of the coupling constants and confirmed by ROESY experiments.

Benzoylation of $\mathbf{3}$ yielded the known derivative 10. The absolute configuration of $\mathbf{1 0}$ was determined by CD studies, with the curve showing a first negative Cotton effect at 236.5 nm and a second positive one at 221.9 nm . As a result, the structure and absolute configuration of $\mathbf{3}$ were proposed as $(1 S, 4 R, 5 S, 6 R, 7 R, 8 R, 9 S, 10 S)$ 6 -acetoxy- 9 -benzoyloxy- 1,8 -dihydroxydihydro- $\beta$-agarofuran. The CD spectrum of $\mathbf{4}$ showed a very close curve to that of $\mathbf{1 0}$, supporting the structure and absolute configuration assignment as ( $1 S, 4 R, 5 S, 6 R, 7 R, 8 R, 9 S, 10 S$ )-1,8,9-tribenzoyloxy-6-hydroxydihydro-$\beta$-agarofuran.

Compound 5 gave a molecular formula of $\mathrm{C}_{33} \mathrm{H}_{38} \mathrm{O}_{8}$, as deduced from its HRESIMS and NMR data. Examination of the NMR spectra (Tables 1 and 2) revealed that this compound was a trisubstituted dihydro- $\beta$-agarofuran sesquiterpene with the presence of a free tertiary hydroxyl and a cinnamyl group [ $\delta 6.92(2 \mathrm{H}, \mathrm{d}, J=7.5 \mathrm{~Hz}), 7.16$ $(2 \mathrm{H}, \mathrm{t}, J=7.5 \mathrm{~Hz})$, and $7.25(1 \mathrm{H}, \mathrm{t}, J=7.5 \mathrm{~Hz})$, and $\delta 7.22(1 \mathrm{H}, \mathrm{d}$, $J=15.9 \mathrm{~Hz})$ and $5.68(1 \mathrm{H}, \mathrm{d}, J=15.9 \mathrm{~Hz})$ ]. The HMBC experiment established the regiosubstitution in the molecule of $\mathbf{5}$, and the relative stereochemistry was resolved by analysis of coupling constants and a ROESY experiment, which showed 5 to be the 1-cinnamyloxy derivative of $\mathbf{3}$. The CD spectrum of $\mathbf{5}$ showed a split curve very similar to that of $\mathbf{1}$, and its absolute configuration was accordingly established as ( $1 S, 4 R, 5 S, 6 R, 7 R, 8 R, 9 S, 10 S$ )-6-acetoxy-9-benzoyloxy-1-cinnamyl-oxy- 8 -hydroxydihydro- $\beta$-agarofuran.

Compounds 6 and 7 were both assigned the molecular formula $\mathrm{C}_{28} \mathrm{H}_{36} \mathrm{O}_{8}$ by HRESIMS. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data (Tables 1 and 2) of $\mathbf{6}$ and 7 indicated that these two compounds were triesterified dihydro- $\beta$-agarofuran sesquiterpenes with the presence of free hydroxy groups. The HMBC experiments (Figure 1) established

Figure 2. Main NOE correlation signals $(\leftrightarrow)$ in the ROESY spectra of $\mathbf{1}, \mathbf{2}, \mathbf{6}$, and $\mathbf{8}$, and CD exciton coupling (dashed arrow) for $\mathbf{1}$.
the regiosubstitution in the molecules of $\mathbf{6}$ and $\mathbf{7}$, and their relative stereochemistry was resolved by analysis of coupling constants and ROESY experiments (Figure 2). The hydroxyl group in 6 was located at C-2 based on the HMBC cross-peak between C-2 at $\delta$ 69.0 and $\mathrm{H}-4$ at $\delta 2.25$ and between $\mathrm{H}-2$ at $\delta 4.39$ and $\mathrm{C}-10$ at $\delta$ 49.6. The hydroxy group in 7 was attached to C-4 on the basis of the HMBC correlations between the hydroxyl proton at $\delta 2.76(\mathrm{OH}-$ $4)$ and carbons at $\delta 69.5$ (C-4) and 25.5 (C-14). Accordingly, the structure 7 was deduced as $1 \alpha, 2 \alpha$-diacetoxy- $9 \beta$-cinnamyloxy- $4 \beta$ -hydroxydihydro- $\beta$-agarofuran.
To determine the absolute configuration of $\mathbf{6}$, it was necessary to introduce another chromophoric group. Benzoylation of $\mathbf{6}$ yielded
the benzoate derivative, $\mathbf{6 a}$. The CD spectrum of $\mathbf{6 a}$ showed a broad positive Cotton effect at 276.3 nm , while the second maximum could not be observed due possibly to the strong positive absorption overlaying background ellipticity. ${ }^{10}$ Thus, the structure and absolute configuration of $\mathbf{6}$ were proposed as $(1 R, 2 S, 4 R, 5 S, 6 R, 7 R, 9 S, 10 R)$ -1,6-diacetoxy-9-cinnamyloxy-2-hydroxydihydro- $\beta$-agarofuran.

Compounds $\mathbf{8}$ and $\mathbf{9}$ were assigned the molecular formulas $\mathrm{C}_{31} \mathrm{H}_{36} \mathrm{O}_{8}$ and $\mathrm{C}_{24} \mathrm{H}_{32} \mathrm{O}_{6}$, respectively, as deduced from their HRESIMS and NMR data. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data (Tables 1 and 2) indicated that compound $\mathbf{8}$ was a triesterified dihydro- $\beta$-agarofuran sesquiterpene with one acetate, two benzoyl, and one secondary hydroxyl group, and 9 was a diesterified dihydro- $\beta$-agarofuran sesquiterpene with one acetate,

${ }^{a}$ Etoposide was used as a positive control.
one benzoyl, and one tertiary hydroxyl group. The HMBC experiments (Figure 1) established the regiosubstitution in the molecules of $\mathbf{8}$ and 9, and their relative stereochemistry was resolved by analysis of coupling constants and ROESY experiments (Figure 2). The hydroxyl group in $\mathbf{8}$ was sited at C-14 on the basis of the HMBC cross-peaks between the carbon at $\delta 62.6(\mathrm{C}-14)$ and the proton at $\delta 2.45(\mathrm{H}-4)$ and between protons at $\delta 3.61,3.55\left(\mathrm{H}_{2}-14\right)$ and the carbon at $\delta 22.7$ (C-3). The hydroxyl group in $\mathbf{9}$ was established at C-6 on the basis of the HMBC correlations between the carbon at $\delta 78.1$ (C-6) and the proton at $\delta 2.24,2.14(\mathrm{H}-8)$ and between the proton at $\delta 4.41(\mathrm{H}-6)$ and carbons at $\delta 82.6$ (C-11) and 32.4 (C-8). The CD spectrum of $\mathbf{8}$ displayed a weak split curve with a first positive Cotton effect at 242.7 nm and a second negative one at 221.4 nm ascribable to the homobenzoate interaction at $\mathrm{C}-6 \beta$ and $\mathrm{C}-9 \beta$, providing its structure and absolute configuration as $(1 S, 4 S, 5 S, 6 R, 7 R, 9 S, 10 S)$-1-acetoxy-6,9-dibenzoyloxy-14-hydroxydihydro- $\beta$-agarofuran. Cinnamylation of 9 gave the known compound 16, which was suitable for applying the dibenzoate chirality method. The CD spectrum of $\mathbf{1 6}$ showed a split curve with a first positive Cotton effect at 279.1 nm and a second negative one at 235.0 nm . Thus, the structure and the absolute configuration of $\mathbf{9}$ were accordingly deduced as $(1 S, 4 R, 5 S, 6 R, 7 R, 9 S, 10 S)$ 1 -acetoxy-9-benzoyloxy-6-hydroxydihydro- $\beta$-agarofuran.

In addition to the nine new dihydro- $\beta$-agarofuran derivatives ( $\mathbf{1} \mathbf{- 9}$ ), 13 known metabolites were also isolated and characterized by comparison with literature data as $6 \beta$-acetoxy- $1 \alpha, 8 \alpha, 9 \alpha$ -tribenzoyloxydihydro- $\beta$-agarofuran $(\mathbf{1 0}),{ }^{11}$ celafolin $\mathrm{C}-1(\mathbf{1 1}),{ }^{12} 9 \alpha-$ acetoxy- $1 \beta, 6 \alpha$-dibenzoyloxydihydro- $\beta$-agarofuran (12), ${ }^{13} 1 \beta$-acetoxy$9 \alpha$-cinnamyloxydihydro- $\beta$-agarofuran (13), ${ }^{13} 2 \alpha, 9 \beta$-diacetoxy-1 $\alpha$ -cinnamyloxydihydro- $\beta$-agarofuran (14), ${ }^{14} 6 \beta$-acetoxy- $1 \alpha, 8 \alpha$-diben-zoyloxy- $9 \alpha$-hydroxydihydro- $\beta$-agarofuran (15), ${ }^{15}$ celafolin A-1 (16), ${ }^{12}$ celafolin B-3, ${ }^{12} 6 \beta, 9 \beta$-diacetoxy- $1 \alpha$-benzoyloxydihydro- $\beta$ agarofuran, ${ }^{14} 1 \alpha, 6 \alpha, 14$-triacetoxy- $9 \beta$-benzoyloxydihydro- $\beta$-agarofuran, ${ }^{16}$ triptogelin B-1, ${ }^{17}$ celafolin B-1, ${ }^{12}$ and $6 \beta$-acetoxy- $8 \alpha, 9 \alpha$ -dibenzoyloxy- $1 \alpha, 2 \alpha$-dihydroxydihydro- $\beta$-agarofuran. ${ }^{18}$

To test the potential anticancer activities of all the isolates obtained, we used a standard in vitro cytotoxicity evaluation system, the HL-60 cell line, to analyze their cytotoxic activities by MTT assays. As a result, the new compounds $\mathbf{1}$ and $\mathbf{5}$ and known sesquiterpene derivatives $\mathbf{1 1} \mathbf{- 1 6}$ were observed to exhibit cytotoxic activities with $\mathrm{IC}_{50}$ values ranging from 1.9 to $8.3 \mu \mathrm{M}$ (Table 3), while the others exhibited less than $50 \%$ of cell growth inhibition at a concentration of up to $10 \mu \mathrm{M}$. Preliminary analysis of the structure-activity relationship from these natural sesquiterpenes revealed that compounds with a hydroxy group at $\mathrm{C}-6, \mathrm{C}-8$, or $\mathrm{C}-9$ $(\mathbf{4}, 5,9$, and $\mathbf{1 5})$ had a slightly decreased cytotoxicity, while compounds with a free hydroxy group at $\mathrm{C}-1, \mathrm{C}-2$, or $\mathrm{C}-14$ showed no such activity, as deduced from $2,6,8$, triptogelin $B-1$, celafolin B-1, celafolin B-3, and $6 \beta$-acetoxy- $8 \alpha, 9 \alpha$-dibenzoyloxy- $1 \alpha, 2 \alpha$ -dihydroxydihydro- $\beta$-agarofuran.

## Experimental Section

General Experimental Procedures. Optical rotations were measured with a Perkin-Elmer 241 MC instrument. CD spectra were recorded on a JASCO J-810 spectrometer. UV spectra were obtained on a Beckman

DU-7 spectrometer. IR spectra were recorded using a Perkin-Elmer 577 spectrometer. LRESIMS were measured using a Finnigan LCQDeca instrument, and HRESIMS data were obtained on a Mariner mass spectrometer. NMR experiments were run on a Bruker AM 400 spectrometer with TMS as internal standard. Preparative HPLC was carried out using a Varian SD-1 instrument equipped with a Merck NW25 $\mathrm{C}_{18}$ column $(12 \mu \mathrm{M}, 20 \mathrm{~mm} \times 250 \mathrm{~mm})$ and ProStar $320 \mathrm{UV} /$ vis detector. Column chromatographic (CC) separations were performed using silica gel H60 ( $300-400$ mesh), zcx-II ( $100-200$ mesh) (Qingdao Haiyang Chemical Group Corporation, Qingdao, People's Republic of China), ODS ( $40-63 \mu \mathrm{M}$ ) (Merck), and Sephadex LH-20 (Pharmacia Biotech AB, Uppsala, Sweden) as packing materials. HSGF254 silica gel TLC plates (Yantai Chemical Industrial Institute, Yantai, People's Republic of China) and RP-18 $\mathrm{WF}_{254}$ TLC plates (Merck) were used for analytical TLC.

Plant Material. The seeds of C. orbiculatus were collected in a suburb of Liaoyuan, Jilin Province, People's Republic of China, in January 2007, and identified by Professor Jingui Shen of Shanghai Institute of Materia Medica, Chinese Academy of Sciences. A voucher specimen (no. 20061202) is deposited at the Herbarium of Shanghai Institute of Materia Medica, Chinese Academy of Sciences.

Extraction and Isolation. Powdered and air-dried seeds of $C$. orbiculatus ( 10.0 kg ) were percolated with $95 \% \mathrm{EtOH}$ at room temperature ( $3 \times 72 \mathrm{~h}$ ). The solvents were evaporated in vacuo, and the residue was suspended in $\mathrm{H}_{2} \mathrm{O}$ and then partitioned with petroleum ether and EtOAc ( $2 \mathrm{~L} \times 3 \mathrm{each}$ ), successively, yielding petroleum ether ( 1.1 kg ) and EtOAc ( 20.5 g ) extracts. The petroleum ether-soluble fraction ( 1.1 kg ) was subjected to silica gel CC eluting with a gradient of petroleum ether and acetone (100:1 to 0:1), and six fractions ( $\mathrm{F}_{1}-\mathrm{F}_{6}$ ) were obtained. $\mathrm{F}_{2}(135.2 \mathrm{~g})$ was chromatographed on silica gel eluting with petroleum ether-acetone ( $\mathrm{P}-\mathrm{A})(40: 1)$ to give $12(100.1 \mathrm{mg})$ and $\mathbf{1 3}(1.0 \mathrm{~g})$. Then, $\mathrm{F}_{3}(120.1 \mathrm{~g})$ was separated into four subfractions $\left(\mathrm{F}_{31}-\mathrm{F}_{34}\right)$ by CC eluting with $\mathrm{P}-\mathrm{A}(40: 1) . \mathrm{F}_{33}(50.5 \mathrm{~g})$ and $\mathrm{F}_{34}(10.5$ g) were subjected to CC over silica gel eluting with $\mathrm{P}-\mathrm{A}$ (40:1), followed by preparative HPLC using a gradient of $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}(70 \%$ to $100 \%$ over $80 \mathrm{~min}, 10 \mathrm{~mL} \cdot \mathrm{~min}^{-1}$ ) to afford $6 \beta, 9 \beta$-diacetoxy- $1 \alpha$ -benzoyloxydihydro- $\beta$-agarofuran ( 200.1 mg ) and $16(150.2 \mathrm{mg})$, and $11(1.3 \mathrm{~g})$, respectively. $\mathrm{F}_{4}(80.2 \mathrm{~g})$ was purified by a combination of silica gel CC eluting with $\mathrm{P}-\mathrm{A}(40: 1)$ and preparative HPLC, using a gradient of $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}\left(70 \%\right.$ to $100 \%$ over $\left.80 \mathrm{~min}, 10 \mathrm{~mL} \cdot \mathrm{~min}^{-1}\right)$, as well as by preparative $\operatorname{TLC}\left(\mathrm{CHCl}_{3}-\right.$ acetone, 100:1), to yield $\mathbf{1}$ (41.2 mg ), 10 ( 80.2 mg ), $1 \alpha, 6 \alpha, 14$-triacetoxy- $9 \beta$-benzoyloxydihydro- $\beta$ agarofuran ( 160.3 mg ), and $\mathbf{1 4}(630.2 \mathrm{mg}) . \mathrm{F}_{6}(60.2 \mathrm{~g})$ was separated by ODS CC eluting with a gradient of $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}(1: 1,7: 3,9: 1$, and $1: 0)$ to give three subfractions $\left(\mathrm{F}_{61}-\mathrm{F}_{63}\right) . \mathrm{F}_{61}(1.5 \mathrm{~g})$ was chromatographed on silica gel eluting with $\mathrm{P}-\mathrm{A}(10: 1)$ and then purified by preparative $\mathrm{TLC}\left(\mathrm{CHCl}_{3}\right.$-acetone, 20:1) to obtain $2(26.9 \mathrm{mg}) . \mathrm{F}_{62}$ $(15.3 \mathrm{~g})$ was subjected to silica gel CC eluting with $\mathrm{CHCl}_{3}$-acetone (100:1), and four fractions $\left(\mathrm{F}_{621}-\mathrm{F}_{624}\right)$ were obtained. $\mathrm{F}_{621}(3.2 \mathrm{~g})$ was separated by a combination of silica gel CC eluting with $\mathrm{P}-\mathrm{A}$ (10:1) and preparative HPLC using a gradient of $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}(60 \%$ to $100 \%$ over $80 \mathrm{~min}, 10 \mathrm{~mL} \cdot \mathrm{~min}^{-1}$ ) and further by preparative TLC $\left(\mathrm{CHCl}_{3}\right.$-acetone, $40: 1$ ) to give triptogelin B-1 ( 144.2 mg ). Compounds $4(7.0 \mathrm{mg}), \mathbf{5}(113.2 \mathrm{mg}), \mathbf{7}(15.8 \mathrm{mg}), \mathbf{9}(3.0 \mathrm{mg})$, and $\mathbf{1 5}(49.5 \mathrm{mg})$ were obtained from $\mathrm{F}_{623}(1.4 \mathrm{~g})$ by using the same steps as described for $\mathrm{F}_{621} . \mathrm{F}_{624}(1.0 \mathrm{~g})$ was purified by preparative HPLC using a gradient of $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}\left(60 \%\right.$ to $100 \%$ over $\left.70 \mathrm{~min}, 10 \mathrm{~mL} \cdot \mathrm{~min}^{-1}\right)$ followed by CC eluting with $\mathrm{P}-\mathrm{A}(8: 1)$ and then passed through a Sephadex LH-20 column with ethanol as eluent, to afford $6(90.2 \mathrm{mg})$, celafolin B-1 ( 30.1 mg ), and celafolin B-3 ( 11.2 mg ). The EtOAc extract ( 20.5 g) was subjected to silica gel CC eluting with $\mathrm{P}-\mathrm{A}(10: 1)$, and four fractions $\left(\mathrm{F}_{1}-\mathrm{F}_{4}\right)$ were obtained. Purification of $\mathrm{F}_{4}(9.6 \mathrm{~g})$ by repeated preparative HPLC using a gradient of $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}(40 \%$ to $100 \%$ over $\left.80 \mathrm{~min}, 10 \mathrm{~mL} \cdot \mathrm{~min}^{-1}\right)$ and further by preparative TLC $\left(\mathrm{CHCl}_{3}-\mathrm{MeOH}\right.$, $50: 1)$ resulted in the isolation of compounds $\mathbf{3}(10.2 \mathrm{mg}), \mathbf{8}(6.0 \mathrm{mg})$, and $6 \beta$-acetoxy- $8 \alpha, 9 \alpha$-dibenzoyloxy- $1 \alpha, 2 \alpha$-dihydroxydihydro- $\beta$-agarofuran ( 15.2 mg ).

( $1 S, 4 R, 5 S, 6 R, 7 R, 9 S, 10 S$ )-1-Acetoxy-9-benzoyloxy-6-hydroxydihy-dro- $\boldsymbol{\beta}$-agarofuran (9): white, amorphous powder; $[\alpha]_{\mathrm{D}}{ }^{20}+55.0(c 0.18$, $\left.\mathrm{CHCl}_{3}\right)$; UV (EtOH) $\lambda_{\text {max }}(\log \epsilon) 230$ (3.99), 273 (2.98) nm; IR (KBr) $\nu_{\max } 2925,1715,1450,1384,1276,1107,714 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR (400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta \mathrm{OBz}-9\left[8.10\left(2 \mathrm{H}, \mathrm{d}, J=7.5 \mathrm{~Hz}, \mathrm{H}-2^{\prime} / 6^{\prime}\right), 7.42(2 \mathrm{H}\right.$, $\left.\mathrm{t}, J=7.5 \mathrm{~Hz}, \mathrm{H}-3^{\prime} / 5^{\prime}\right)$, and $\left.7.58\left(1 \mathrm{H}, \mathrm{t}, J=7.5 \mathrm{~Hz}, \mathrm{H}-4^{\prime}\right)\right]$, for other signals, see Table $1 ;{ }^{13} \mathrm{C}$ NMR $\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta \mathrm{OBz}-9$ [129.8 (s, $\mathrm{C}-1^{\prime}$ ), 130.1 ( $\mathrm{d}, \mathrm{C}-2^{\prime} / 6^{\prime}$ ), 128.3 ( $\mathrm{d}, \mathrm{C}-3^{\prime} / 5^{\prime}$ ), 133.2 ( $\mathrm{d}, \mathrm{C}-4^{\prime}$ ), and 165.7 (s, $\left.\left.\mathrm{CO}_{2}-9\right)\right]$, for other signals, see Table 2; ESIMS m/z $439[\mathrm{M}+\mathrm{Na}]^{+}$; HRESIMS $m / z 439.2085[\mathrm{M}+\mathrm{Na}]^{+}$(calcd for $\mathrm{C}_{24} \mathrm{H}_{32} \mathrm{O}_{6} \mathrm{Na}, 439.2097$ ).

Cinnamoylation of 9. Compound $9(2.5 \mathrm{mg})$ was dissolved in dry pyridine $(0.5 \mathrm{~mL})$, and cinnamoyl chloride ( 3 drops) and a catalytic amount of 4-(dimethylamino)pyridine were added. Then, the mixture was stirred at rt for 48 h , poured into $\mathrm{H}_{2} \mathrm{O}$, extracted with EtOAc , and purified on preparative TLC developed with a solvent of petroleum ether- $\operatorname{EtOAc}(5: 1)$, to give compound $16\left[1.5 \mathrm{mg}, R_{f} 0.45 ; \mathrm{CD}(\mathrm{MeOH})\right.$ $\left.\lambda_{\text {ext }}(\Delta \epsilon) 279.1(+5.22), 235.0(-4.01) \mathrm{nm}\right]$.

Cytotoxicity Assays. HL-60 human leukemia cells were plated into 96 -well plates containing $90 \mu \mathrm{~L}$ of medium. Cells were treated in triplicate with gradient concentrations of the tested compounds for 72 h . Thereafter, 3-(4,5-dimethylthiazo-2-yl)-2,5-diphenyltetrazolium bromide (Sigma, St. Louis, MO) solution was added to each well. After 4 h of incubation at $37{ }^{\circ} \mathrm{C}, 50 \mu \mathrm{~L}$ of extraction buffer ( $10 \%$ SDS, $5 \%$ isobutanol, and 0.01 M hydrochloric acid) was added, the cells were incubated overnight at $37{ }^{\circ} \mathrm{C}$, and the absorbance was then measured at 570 nm using a 96-well multiscanner (Molecular Devices, Mississauga, Ontario, Canada). The concentrations giving $50 \%$ growth inhibition $\left(\mathrm{IC}_{50}\right)$ were calculated with the Logit method. The anticancer drug etoposide was used as a positive control.
