Received February 23, 2009

#### Abstract

Fourteen new lignans, tiegusanins $A-N(\mathbf{1} \mathbf{1 4})$, together with 13 known compounds were isolated from the aerial parts of Schisandra propinqua var. sinensis. The structures and absolute configurations of 1-13 were established using a combination of spectroscopic techniques. Compound $\mathbf{1 4}$ was obtained as a racemate. When evaluated for inhibitory activity against HIV-1, tiegusanin G(7) showed anti-HIV-1 activity with an $\mathrm{EC}_{50}$ value of $7.9 \mu \mathrm{M}$ and a therapeutic index (TI) of more than 25.

The plant family Schisandraceae, consisting of the genera Schisandra and Kadsura, contains several important medicinal plants. Species of this family have yielded numerous lignans demonstrating various biological activities, including antitumor, ${ }^{1}$ cytotoxic, ${ }^{2-5}$ anti-HIV, ${ }^{6,7}$ antioxidative, ${ }^{8,9}$ antihepatitis, ${ }^{10}$ and hepatoprotective effects. ${ }^{11}$ Schisandra propinqua (Wall.) Hook. f. et Thoms. var. sinensis Oliv., popularly known as "tie-gu-san" in the Shenlongjia district of mainland China, is used in folk medicine for the treatment of arthritis, traumatic injury, gastralgia, angeitis, and related diseases. ${ }^{12}$ Three lignans and one triterpenoid were reported from this species in a previous paper. ${ }^{2}$ Motivated by a search for bioactive metabolites from this plant, a reinvestigation of the chemical constituents was carried out. As a result, 27 lignans were isolated, including 14 new substances, tiegusanins $A-N$ ( $\mathbf{1} \mathbf{- 1 4}$ ). The structures of compounds $\mathbf{1}-\mathbf{1 4}$ were established from their spectroscopic data. The absolute configurations of $\mathbf{1 - 1 3}$ were determined by CD and ROESY experiments. Most of the compounds were evaluated in an anti-HIV assay, and the results are described herein.

## Results and Discussion

A 70\% aqueous acetone extract of the aerial parts of S. propinqua var. sinensis was partitioned between EtOAc and $\mathrm{H}_{2} \mathrm{O}$ (1:1). The EtOAc layer was subjected repeatedly to column chromatography on silica gel, MCI gel, Sephadex LH-20, and RP-18 and then purified by HPLC to afford 14 new lignans, tiegusanins A-N (1-14). Also obtained were 13 known substances, methyl schisantherin $\mathrm{F}(\mathbf{1 5}),{ }^{13}$ kadsurin (16), ${ }^{14}$ interiotherin $\mathrm{C}(\mathbf{1 7}),{ }^{15}(7 S, 8 S, R$ -biar)-6,6,7,8-tetrahydro-12,13-methylenedioxy-1,2,3,14-tetramethoxy-7,8-dimethyldibenzo[a,c]cycloocten-9-one (18), ${ }^{16}$ mesodihydroguaiaretic acid (19), ${ }^{17}$ meso-monomethyldihydroguaiaretic acid (20), ${ }^{18} 4,4^{\prime}$-( $2 R, 3 S$ )-2,3-dimethylbutane-1,4-diyl)bis(1,2-dimethoxybenzene) (21), ${ }^{19}$ galgravin (22), ${ }^{20}$ dimethyltetrahydrofuroguaiacin (23), ${ }^{20}$ austrobailignan- $7(\mathbf{2 4}),{ }^{21}(-)$-machilusin (25), ${ }^{22}(2 R, 3 S, 4 R, 5 R)$ -2-(3,4-dimethoxyphenyl)-3,4-dimethyl-5-piperonyltetrahydrofuran (26), ${ }^{23}$ and ( $8 R, 7^{\prime} R, 8 R$ )-5-hydroxy- $4,3^{\prime}, 4^{\prime}$-trimethoxy- $2,7^{\prime}$ cyclolignan (27). ${ }^{24}$ The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of the new lignans $\mathbf{1 - 1 4}$ are listed in Tables $1-5$.

[^0]In a previous paper, as a modified product of schisantherin $F$, only ${ }^{1} \mathrm{H}$ NMR data of its five methoxy groups were reported. ${ }^{13}$ In the present study, we obtained this compound (15) as a new natural product and report its ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra (Tables 2 and 4) for the first time. The structure and absolute configuration of $\mathbf{1 5}$ were established from its extensive NMR spectra and CD data and by single-crystal X-ray analysis (Figure 1). The structural clarification of $\mathbf{1 5}$ was very important for the determination of the structures of $\mathbf{1}$ and $\mathbf{2}$, because their NMR spectra were very close to those of 15.

Tiegusanin A (1), obtained as a white powder, showed the molecular ion peak $[\mathrm{M}+\mathrm{Na}]^{+}$at $m / z 525.2445$ (calcd 525.2464) in the HRESIMS, corresponding to the molecular formula $\mathrm{C}_{28} \mathrm{H}_{38} \mathrm{O}_{8}$, requiring 10 degrees of unsaturation. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of $\mathbf{1}$ (Tables 1 and 3 ) indicated the presence of 12 aromatic carbons, two aromatic protons, and five methoxy groups, suggesting the presence of a biphenyl moiety. ${ }^{25} \mathrm{HMBC}$ correlations of $\mathrm{H}-11$ with $\mathrm{C}-9, \mathrm{C}-10, \mathrm{C}-12, \mathrm{C}-13, \mathrm{C}-15$, and $\mathrm{C}-16$, and $\mathrm{H}-4$ with $\mathrm{C}-2, \mathrm{C}-3$, C-5, C-6, C-15, and C-16, and ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY correlations of $\mathrm{H}-6 /$ $\mathrm{H}-7 / \mathrm{H}-8, \mathrm{H}-7 / \mathrm{H}_{3}-17$, and $\mathrm{H}-8 / \mathrm{H}_{3}-18$ (Figure 2), together with UV absorption bands at $318,241,228$, and 220 nm and IR absorption bands at $3499(\mathrm{OH}), 1716(\mathrm{C}=\mathrm{O}), 1647(\mathrm{C}=\mathrm{C}), 1596,1579$ (aromatic ring) $\mathrm{cm}^{-1}$ implied that $\mathbf{1}$ is a dibenzocyclooctadiene lignan possessing a hydroxy group and an ester linkage. ${ }^{25,26}$ The signals at $\delta_{\mathrm{C}} 176.5 \mathrm{~s}, 41.2 \mathrm{~d}, 26.6 \mathrm{t}, 11.3 \mathrm{q}$, and 16.5 q suggested the presence of a 2-methylbutyryloxy group ( $O$-isovaleryl). ${ }^{14}$ Further analysis of the HMBC spectrum showed five methoxy groups to be located at C-2, C-3, C-12, C-13, and C-14, respectively, with two secondary methyl groups ( $\delta_{\mathrm{C}} 15.2$ and 20.2 ) assignable to $\mathrm{CH}_{3}-17$ and $\mathrm{CH}_{3}-18$, respectively. Comparison of the NMR data of $\mathbf{1}$ with those of $\mathbf{1 5}$ suggested C-9 of $\mathbf{1}$ is also substituted by a hydroxy group, and accordingly, the 2-methylbutyryloxy group was located at C-1. Thus, the planar structure of compound $\mathbf{1}$ was established.

The CD curve of $\mathbf{1}$ showed a negative Cotton effect around 250 nm and a positive value around 220 nm , suggesting that $\mathbf{1}$ possesses an $S$-biphenyl configuration, ${ }^{25}$ identical to that of $\mathbf{1 5} .{ }^{13}$ ROESY correlations of $\mathrm{H}-11$ with $\mathrm{H}-8$ and $\mathrm{H}-9, \mathrm{H}-4$ with $\mathrm{H}-6 \alpha$ and $\mathrm{H}_{3}-17$, $\mathrm{H}_{3}-18$ with $\mathrm{H}-9$ and $\mathrm{H}_{3}-17$, and $\mathrm{H}-8$ with $\mathrm{H}-7$ and $\mathrm{H}-6 \beta$ (Figure 3) suggested a cyclooctadiene lignan with a twisted boat/chair conformation of $\mathbf{1}$, consistent with the absolute configurations of C-7 $(R)$, C-8 $(R)$, and C-9 $(R),{ }^{9}$ which were also identical to $15 .{ }^{13}$

Comparison of the NMR data of $\mathbf{2}$ and $\mathbf{3}$ with those of $\mathbf{1}$ disclosed that the main structural differences between them were the

## Chart 1

substituent patterns. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of $\mathbf{2}$ and $\mathbf{3}$ (Tables 1 and 3) were quite similar to those of $\mathbf{1}$, except that the 2-methylbutyryloxy group in $\mathbf{1}$ was changed to a 2-methylpropionyloxy group ( $O$-isobutyryl, $\delta_{\mathrm{C}} 176.8 \mathrm{~s}, 34.0 \mathrm{~d}, 18.7 \mathrm{q}, 18.6 \mathrm{q}$ ) in $2^{27}$ and a benzoyloxy group $\left(\delta_{\mathrm{C}} 165.8 \mathrm{~s}, 129.0 \mathrm{~s}, 130.2 \mathrm{~d}, 128.3 \mathrm{~d}\right.$, $133.5 \mathrm{~d}, 128.3 \mathrm{~d}, 130.2 \mathrm{~d}$ ) in $3 .{ }^{28}$ Comparison of the 1D NMR data of 2 with those of $\mathbf{1}$ and HMBC correlations of the five methoxy groups with $\mathrm{C}-2, \mathrm{C}-3, \mathrm{C}-12, \mathrm{C}-13$, and $\mathrm{C}-14$, respectively, indicated that the 2-methylpropionyloxy group was located at $\mathrm{C}-1$ of $\mathbf{2}$. However, the benzoyloxy group in $\mathbf{3}$ was deduced to be located at $\mathrm{C}-14$ from the observation of HMBC correlations of the five methoxy groups in 3 with C-1, C-2, C-3, C-12, and C-13 (Figure $2)$ and the close chemical shifts of C-9 with those of $\mathbf{1}$. By comparison of CD, UV, and ROESY spectra with those of $\mathbf{1}$, compounds $\mathbf{2}$ and $\mathbf{3}$ were also assigned as $S$-biphenyl-configured dibenzocyclooctadiene lignans with twisted boat/chair conformations of the cyclooctadiene ring. Therefore, the structures of compounds $\mathbf{2}$ and $\mathbf{3}$ were determined as shown.
Tiegusanin $\mathrm{D}(\mathbf{4})$, obtained as a white, amorphous powder, gave the molecular formula $\mathrm{C}_{37} \mathrm{H}_{36} \mathrm{O}_{11}$ from its HRESIMS data at $\mathrm{m} / \mathrm{z}$ $679.2136[\mathrm{M}+\mathrm{Na}]^{+}$(calcd 679.2155). The UV spectrum of 4 showed absorption maxima at 241, 226, and 223 nm , indicating this compound also to be a dibenzocyclooctadiene lignan. ${ }^{25}$ The
${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of 4 (Tables 1 and 3) showed signals due to a secondary methyl ( $\delta_{\mathrm{H}} 1.36,3 \mathrm{H}, \mathrm{d}, J=7.2 \mathrm{~Hz}$ ), assignable to the $\mathrm{CH}_{3}-18$ group, a tertiary methyl ( $\delta_{\mathrm{H}} 1.44,3 \mathrm{H}, \mathrm{s}$ ), assignable to the $\mathrm{CH}_{3}-17$ group, a methylenedioxy moiety $\left(\delta_{\mathrm{H}} 5.79,5.67,1 \mathrm{H}\right.$ each, AB ), four methoxy groups ( $\delta_{\mathrm{H}} 4.02,3.41,3.30,3.16,3 \mathrm{H}$ each, $s$ ) on two aromatic rings, two benzoyl groups ( $\delta_{\mathrm{H}} 7.46-7.52$, $4 \mathrm{H}, \mathrm{m} ; \delta 7.30-7.34,2 \mathrm{H}, \mathrm{m} ; \delta 7.24-7.28,4 \mathrm{H}, \mathrm{m}$ ), and a hydroxy group ( $\delta 2.40,1 \mathrm{H}, \mathrm{s}$ ). Furthermore, HMBC correlations of four methoxy groups with C-1, C-2, C-3, and C-14, respectively, were used to determine their positions. The occurrence of the methylenedioxy moiety at C-12 and C-13 was demonstrated by the HMBC correlations of $\mathrm{H}_{2}-9$ with $\mathrm{C}-12$ and $\mathrm{C}-13$. HMBC correlations of H-6 with $\mathrm{C}=\mathrm{O}\left(\delta_{\mathrm{C}} 164.7\right)$ and $\mathrm{H}-9$ with $\mathrm{C}=\mathrm{O}\left(\delta_{\mathrm{C}} 164.9\right)$ showed the occurrence of two benzoyloxy groups at C-6 and C-9. In addition, HMBC correlations of the hydroxy group with C-7 and $\mathrm{C}-17$ showed the location of this hydroxy group at $\mathrm{C}-7\left(\delta_{\mathrm{C}} 74.2\right)$. The biphenyl group in $\mathbf{4}$ was determined to have an $S$ configuration from its CD spectrum. The observed ROESY correlations of $\mathrm{H}-11 /$ H-8, H-9; H-4/H-6, OH-7; H3-17/H-6, H-8; and $\mathrm{H}_{3}-18 / \mathrm{H}-9$, OH-7, as well as the $J$ value between H-8 and H-9 $\left(J_{8,9}=0 \mathrm{~Hz}, \Phi_{8,9}=\right.$ $90^{\circ}$ ), were in agreement with a cyclooctadiene lignan with a twisted boat/chair conformation having C-6 (S), C-7 (S), C-8 (S), and C-9 $(R)$ absolute configurations, which were the same as those of

Table 1. ${ }^{1} \mathrm{H}$ NMR Data of Compounds $\mathbf{1}-7\left[\mathrm{CDCl}_{3}, \delta_{\mathrm{H}}(J\right.$ in Hz$\left.)\right]$

${ }^{a} 500 \mathrm{MHz} .{ }^{b} 400 \mathrm{MHz} .{ }^{c}$ Overlapped.
kadangusin C. ${ }^{29}$ Therefore, the structure of tiegusanin $D(4)$ was established as shown.

Analysis of the 2D NMR data of tiegusanins E-G (5-7) and comparison of their 1D NMR data with those of 4 revealed that the main structure differences between these compounds were the substituent patterns at C-6 and C-9. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of 5 (Tables 1 and 3) were quite similar to those of $\mathbf{4}$ except for the characteristic signals due to a benzoyloxy group and a caproyloxy group ( $\delta_{\mathrm{C}} 171.7 \mathrm{~s}, 33.7 \mathrm{t}, 24.1 \mathrm{t}, 22.2 \mathrm{t}, 31.0 \mathrm{t}, 13.8 \mathrm{t}$ ). These two substituents were determined to be located at C-6 and C-9, respectively, by HMBC correlations of H-6 with $\mathrm{C}-1^{\prime}\left(\delta_{\mathrm{C}}\right.$ 164.7) and H-9 with $\mathrm{C}-1^{\prime \prime}\left(\delta_{\mathrm{C}} 171.7\right) .{ }^{10}$ Similarly, the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of $\mathbf{6}$ (Tables 1 and 3) were very close to those of $\mathbf{4}$ except for the characteristic signals due to a benzoyloxy group and a trans-cinnamate moiety $\left(\delta_{\mathrm{C}} 164.7 \mathrm{~s}, 116.8 \mathrm{~d}, 145.5 \mathrm{~d}, 133.7 \mathrm{~s}\right.$, $128.1 \mathrm{~d}, 127.9 \mathrm{~d}, 130.6 \mathrm{~d}, 127.9 \mathrm{~d}, 128.1 \mathrm{~d}$ ) at C-6 and C-9, instead of two benzoyl groups. ${ }^{31}$ HMBC correlations of H-6 with C-1' $\left(\delta_{\mathrm{C}}\right.$ 164.7) and $\mathrm{H}-9$ with $\mathrm{C}-1^{\prime \prime}\left(\delta_{\mathrm{C}} 164.9\right)$ in $\mathbf{6}$ established the locations of the trans-cinnamate moiety at C-6 and the benzoyloxy group at C-9. Comparison of the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra between 7 (Tables 1 and 3 ) and $\mathbf{6}$ suggested the close similarity of these compounds. In 7, an angeloyloxy group ( $\delta_{\mathrm{C}} 165.8 \mathrm{~s}, 126.9 \mathrm{~s}, 139.9 \mathrm{~d}, 15.5 \mathrm{q}$, 19.7 q) was located at C-6 and a trans-cinnamate moiety at C-9, from the HMBC correlations of H-6 with $\mathrm{C}-1^{\prime}\left(\delta_{\mathrm{C}} 165.8\right)$ and $\mathrm{H}-9$
with C-1" ( $\delta_{\mathrm{C}}$ 165.0), respectively. Accordingly, tiegusanin G (7) was determined structurally as shown.
Both tiegusanins H (8) and I (9) were isolated as white, amorphous powders. Their molecular formulas, $\mathrm{C}_{35} \mathrm{H}_{38} \mathrm{O}_{10}$ and $\mathrm{C}_{31} \mathrm{H}_{38} \mathrm{O}_{10}$, were determined by HRESIMS ( $\mathrm{m} / \mathrm{z} .641 .2359[\mathrm{M}+$ $\mathrm{Na}]^{+}$and $593.2370[\mathrm{M}+\mathrm{Na}]^{+}$, respectively). The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra (Tables 2 and 4), together with their CD, UV, and IR data, suggested that $\mathbf{8}$ and $\mathbf{9}$ are also $S$-biphenyl-configured dibenzocyclooctadiene lignans. ${ }^{25}$ Comparison of the spectroscopic data of $\mathbf{8}$ and 9 with those of $\mathbf{7}$ revealed the presence of a benzoyloxy group at $\mathrm{C}-9$ in $\mathbf{8}$ and a propionyl group ( $\delta_{\mathrm{C}} 173.6,27.1,8.6$ ) at $\mathrm{C}-9$ in 9 , by analysis of their HMBC spectra. In addition, no hydroxy group occurred at C-7 in either $\mathbf{8}$ or $\mathbf{9}$, consistent with the significant upfield chemical shifts of C-7 and C-17 and the noticeable change of $\mathrm{H}_{3}-17$ from single peaks to doublets. Furthermore, the orientations of all substituents in $\mathbf{8}$ and $\mathbf{9}$ were the same as those in 7, from the ROESY experiments.

Tiegusanin $\mathrm{J}(\mathbf{1 0})$ gave a molecular formula of $\mathrm{C}_{33} \mathrm{H}_{40} \mathrm{O}_{10}$ by HRESIMS at $m / z 619.2522[\mathrm{M}+\mathrm{Na}]^{+}$(calcd 619.2519). The NMR data indicated that $\mathbf{1 0}$ (Tables 2 and 4 ) is an analogue of $\mathbf{9}$ with two tiglyloxy groups substituted at C-6 and C-9. Tiegusanin K (11) was shown to differ from 8 by the replacement of the C-9 benzoyloxy group in $\mathbf{8}$ with a trans-cinnamate group, and the C-1 methoxy group in $\mathbf{8}$ with a hydroxy group. The ROESY experiment

${ }^{a} 500 \mathrm{MHz} .{ }^{b} 400 \mathrm{MHz} .{ }^{c}$ Overlapped.
revealed that all of the substituents in $\mathbf{1 1}$ have the same orientations as those in 9, except for $\mathrm{CH}_{3}-17$. Correlations of $\mathrm{H}-4$ with $\mathrm{H}_{3}-17$ suggested that $\mathrm{CH}_{3}-17$ should have an $\alpha$-orientation in $\mathbf{1 1}$. However, $\mathrm{H}-4$ showed no correlations with $\mathrm{H}_{3}-17$, indicating that $\mathrm{CH}_{3}-17$ is $\beta$-oriented in 9.

Tiegusanin L(12) was obtained as a yellow, amorphous solid. Comparison of the NMR data between $\mathbf{1 2}$ and $\mathbf{1 1}$ (Tables 2 and 4), in combination with the molecular formula $\mathrm{C}_{31} \mathrm{H}_{32} \mathrm{O}_{8}$, deduced from HRESIMS at $m / z 555.1992[\mathrm{M}+\mathrm{Na}]^{+}$(calcd 555.1994), showed that $\mathbf{1 2}$ is also a dibenzocyclooctadiene lignan structurally similar to 11. The main differences found were the positions of substituents of the OH group at $\mathrm{C}-3$ in $\mathbf{1 2}$ instead of $\mathrm{C}-1$ in $\mathbf{1 1}$ and the trans-cinnamate group at C-6 in $\mathbf{1 2}$ instead of C-9 in $\mathbf{1 1}$. However, the CD spectrum of $\mathbf{1 2}$ showed a negative Cotton effect around 220 nm and a positive value around 250 nm , suggesting that $\mathbf{1 2}$ possesses an $R$-biphenyl configuration. ${ }^{25}$ The absolute configuration of $\mathbf{1 2}$ was determined by means of a ROESY experiment and comparison with that of gomisin $\mathrm{A} .{ }^{25}$ The ROESY correlations of $\mathrm{H}-11 / \mathrm{H}-9 \alpha, \mathrm{H}-4 / \mathrm{H}_{3}-17$, and $\mathrm{H}_{3}-17 / \mathrm{H}_{3}-18$ in 12, instead of $\mathrm{H}-11 / \mathrm{H}_{3}-18$ and $\mathrm{H}-4 / \mathrm{H}-6 \beta$ in 11 , indicated that the transcinnamate group and two methyls are all $\beta$-oriented. These were in agreement with a cyclooctadiene lignan with a twisted boat/ chair conformation having C-6 (R), C-7 (R), and C-8 (R) absolute configurations.

Tiegusanin M (13) was obtained as a brown gum. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of $\mathbf{1 3}$ (Tables 2 and 4) were similar to those of schisanlignone $\mathrm{A},{ }^{30}$ except that $\mathbf{1 3}$ was observed to have an $\mathrm{OCH}_{2} \mathrm{O}$ group in the aromatic ring and an OOH functionality in the cyclooctadiene ring, as supported by a series of characteristic ion peaks at $m / z 469[\mathrm{M}+\mathrm{Na}]^{+}, 447[\mathrm{M}+\mathrm{H}]^{+}, 429[\mathrm{M}-\mathrm{OH}]^{+}$, and $413[\mathrm{M}-\mathrm{OOH}]^{+}$in the ESIMS. The hydroperoxy group was assigned at C-8 because the signals at $\delta_{\mathrm{H}} 0.99(3 \mathrm{H}, \mathrm{d}, J=6.8 \mathrm{~Hz}$, $\left.\delta_{\mathrm{C}} 15.0, \mathrm{q}\right)$ and $\delta_{\mathrm{H}} 2.62\left(1 \mathrm{H}, \mathrm{m}, \delta_{\mathrm{C}} 40.8, \mathrm{~d}\right)$ due to $\mathrm{CH}_{3}-18$ and CH-8 in schisanlignone $\mathrm{A}^{30}$ were shifted downfield to $\delta_{\mathrm{H}} 1.57(3 \mathrm{H}$, $\left.\mathrm{s}, \delta_{\mathrm{C}} 17.6, \mathrm{q}\right)$ and $\delta_{\mathrm{C}} 92.2(\mathrm{~s})$ in 13. HMBC correlations of $\mathrm{H}_{3}-18$ ( $\delta 1.57$ ) with $\mathrm{C}-7(\delta 37.2$ ), $\mathrm{C}-8(\delta 92.2)$, and $\mathrm{C}-9(\delta 206.9)$ supported the above assignment. The $\mathrm{OCH}_{2} \mathrm{O}$ attached to $\mathrm{C}-12$ and C-13 was confirmed by the correlations of $\mathrm{H}_{2}-19$ ( $\delta 6.03$ ) with C-12 ( $\delta 148.4$ ) and C-13 ( $\delta 137.1$ ). The CD spectrum of $\mathbf{1 3}$ showed a negative Cotton effect around 250 nm and a positive value around 220 nm , suggesting this compound possesses an $S$-biphenyl configuration, the same as those of schisantherin Q and yunnankadsurin A. ${ }^{33,34}$ Comparison of the spectroscopic data of $\mathbf{1 3}$ and other dibenzocyclooctadiene lignans with aC-6 or C-9 oxo substitution ${ }^{31-33}$ revealed that the cyclooctadiene ring possesses a stable twisted boat conformation and that two methyl groups are both $\alpha$-oriented in 13. These methyl groups of $\mathbf{1 3}$ appeared at $\delta_{\mathrm{C}} 17.6$ and 14.3 , which differ from those of dibenzocyclooctadiene lignans possessing a

${ }^{a} 125 \mathrm{MHz} .{ }^{b} 100 \mathrm{MHz} .{ }^{c}$ Overlapped.
twisted boat/chair conformation of the cyclooctadiene ring. Commonly, the chemical shifts of two methyl groups in lignans possessing a twisted boat conformation are close, while the analogous values for compounds having a twisted boat/chair conformation have greater differences. ${ }^{6,33,34}$ The above analysis indicated that $\mathbf{1 3}$ possesses a twisted boat conformation having C-7 $(R)$ and C-8 ( $S$ ) absolute configurations. Therefore, the structure of tiegusanin M (13) was determined as shown.

Tiegusanin N (14) was obtained as a white, amorphous solid. Its molecular formula was determined as $\mathrm{C}_{23} \mathrm{H}_{32} \mathrm{O}_{5}$ by the HRESIMS at $m / z 411.2155[\mathrm{M}+\mathrm{Na}]^{+}$(calcd 411.2147). The functional group signals appearing in the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra included two aromatic rings, five methoxy groups, two methyl groups, two methylene groups, and seven methine groups. The strong IR absorption bands indicated the presence of aromatic rings (1590, 1514, and $1462 \mathrm{~cm}^{-1}$ ). HMBC correlations found from $\mathrm{H}-2$ and $\mathrm{H}-6$ to $\mathrm{C}-7$ and from $\mathrm{H}-2^{\prime}$ and $\mathrm{H}-6^{\prime}$ to $\mathrm{C}-7^{\prime}$ implied that the two substituted aromatic moieties were not linked directly (Figure 2). Moreover, the HMBC correlations of $\mathrm{H}_{3}-9$ with $\mathrm{C}-7, \mathrm{C}-8$, and $\mathrm{C}-8^{\prime}$, of $\mathrm{H}_{3}-9^{\prime}$ with $\mathrm{C}-7^{\prime}, \mathrm{C}-8^{\prime}$, and $\mathrm{C}-8$, of $\mathrm{H}_{2}-7$ with $\mathrm{C}-1, \mathrm{C}-2, \mathrm{C}-6, \mathrm{C}-8$, and $\mathrm{C}-9$, and of $\mathrm{H}_{2}-7^{\prime}$ with $\mathrm{C}-1^{\prime}, \mathrm{C}-2^{\prime}, \mathrm{C}-6^{\prime}, \mathrm{C}-8^{\prime}$, and $\mathrm{C}-9^{\prime}$, together with the spin systems of $\mathrm{H}-7 / \mathrm{H}-8 / \mathrm{H}-8^{\prime} / \mathrm{H}-7^{\prime}, \mathrm{H}-8 / \mathrm{H}-9$, and $\mathrm{H}-8^{\prime} /$ $\mathrm{H}-9^{\prime}$ in the ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY spectrum, suggested that $\mathbf{1 4}$ is a substituted 1,4-biphenyl-2,3-dimethylbutane-type lignan (Figure 2). ${ }^{35}$ The correlations from the protons of five methoxy groups to $\mathrm{C}-3, \mathrm{C}-4, \mathrm{C}-3^{\prime}, \mathrm{C}-4^{\prime}$, and $\mathrm{C}-5^{\prime}$ were used to locate these groups at
$\mathrm{C}-3, \mathrm{C}-4, \mathrm{C}-3^{\prime}, \mathrm{C}-4^{\prime}$, and $\mathrm{C}-5^{\prime}$, respectively. Since the $\mathrm{C}-\mathrm{C}$ bonds can rotate randomly, the relative configuration of $\mathbf{1 4}$ could not be determined on the basis of ROESY spectra. Thus, the structure of tiegusanin N (14) was established as shown.

The lignans from S. propinqua var. sinensis were tested for their ability to prevent the cytopathic effects of HIV-1 in C8166 cells, and their cytotoxicity was measured in parallel with the determination of antiviral activity, using AZT as a positive control (Table 6 ). Among the compounds tested, 7 exhibited the most potent anti-HIV-1 activity, with an $\mathrm{EC}_{50}$ of $7.9 \mu \mathrm{M}$, a $\mathrm{CC}_{50}$ value of more than $200 \mu \mathrm{M}$, and therefore a TI of greater than 25 . Compounds $\mathbf{8}$, 12, 15, and 17 and the epimeric diastereomers 22 and 23 (1:1) showed weak to moderate anti-HIV activity (Table 6). Compounds $\mathbf{2}, \mathbf{1 1}, \mathbf{1 3}$, and 26 were not tested for their bioactivity due to the limited amounts available.

## Experimental Section

General Experimental Procedures. Optical rotations were measured with a Horiba SEPA-300 polarimeter. UV spectra were obtained using a Shimadzu UV-2401A spectrophotometer. CD spectra were measured on a JASCO J-810 spectropolarimeter. A Tenor 27 spectrophotometer was used for scanning IR spectroscopy with KBr pellets. 1D and 2D NMR spectra were recorded on Bruker AM-400 and DRX-500 spectrometers with TMS as internal standard. Unless otherwise specified, chemical shifts $(\delta)$ are expressed in ppm with reference to the solvent signals. HRESIMS was performed on an API QSTAR time-

of-flight mass spectrometer. Semipreparative HPLC was performed on an Agilent 1100 liquid chromatograph with a Zorbax SB-C $\mathrm{C}_{18}(9.4 \mathrm{~mm}$ $\times 25 \mathrm{~cm}$ ) column. Column chromatography was performed with silica gel (200-300 mesh, Qingdao Marine Chemical, Inc., Qingdao, People's Republic of China), Lichroprep RP-18 gel ( $40-63 \mu \mathrm{~m}$, Merck, Darmstadt, Germany), and MCI gel (75-150 $\mu \mathrm{m}$, Mitsubishi Chemical Corporation, Tokyo, Japan). Fractions were monitored by TLC, and spots were visualized by heating Si gel plates sprayed with $5 \% \mathrm{H}_{2} \mathrm{SO}_{4}$ in EtOH .

Plant Material. The aerial parts of S. propinqua var. sinensis were collected in the Erlang Mountain area of Sichuan Province, People's Republic of China, in September 2007. The sample was identified by Prof. Xi-Wen Li, and a voucher specimen (KIB-07-09-23) has been deposited in the State Key Laboratory of Phytochemistry and Plant Resources in West China, Kunming Institute of Botany, Chinese Academy of Sciences.

Extraction and Isolation. The air-dried and powdered aerial parts of $S$. propinqua var. sinensis ( 17 kg ) were extracted four times with $70 \%$ aqueous $\mathrm{Me}_{2} \mathrm{CO}(4 \times 50 \mathrm{~L})$ at room temperature and filtered to yield a filtrate, which was evaporated under reduced pressure and partitioned with EtOAc ( $4 \times 10 \mathrm{~L}$ ). The EtOAc partition $(320 \mathrm{~g})$ was applied to silica gel (200-300 mesh) column chromatography eluting with $\mathrm{CHCl}_{3}-\mathrm{MeOH}$ (1:0-0:1 gradient system), to give four fractions, $1-4$. Fraction 1 was decolorized on MCI gel, eluted with $90 \%$ $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$, to yield a brown gum ( 86 g ). The gum was subjected to silica gel column chromatography, eluted with petroleum ether-acetone ( $9: 1-1: 1$ ), and yielded fractions $1.1-1.7$. Fraction 1.1 ( 9.5 g ) was applied to a Sephadex LH-20 column, using $\mathrm{CHCl}_{3}-\mathrm{MeOH}$ (1:1) as eluant, to afford fractions 1.1.1-1.1.5. Fraction 1.1.1 ( 292 mg ) provided

12 ( 4 mg ) after being chromatographed over RP-18 ( $60 \%-80 \%$ $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ gradient system) and normal-phase silica gel (petroleum ether-EtOAc, 15:1-2:1 gradient system). Further purification by semipreparative HPLC with $75 \% \mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ yielded $\mathbf{1}(4 \mathrm{mg}), 2$ ( 1 $\mathrm{mg}), \mathbf{3}(5 \mathrm{mg})$, and $\mathbf{1 5}(93 \mathrm{mg})$. Fraction 1.1.2 (1.8 g) was further separated (fractions 1.1.2.1-1.1.2.3) using a RP-18 column ( $50 \%-100 \%$ $\mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ gradient system). Fraction 1.1.2.1 ( 62 mg ) was purified over silica gel (petroleum ether- $\mathrm{Me}_{2} \mathrm{CO}, 6: 1$ ) to furnish 18 ( 31 mg ) and $25(1 \mathrm{mg})$. Fraction 1.1.2.2 ( 32 mg ) was chromatographed by semipreparative HPLC with $70 \% \mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ to yield $\mathbf{1 6}(3 \mathrm{mg})$ and $26(2 \mathrm{mg})$. Compound $25(608 \mathrm{mg})$ was precipitated from fraction 1.1.2.3 ( 731 mg ), and the mother liquor was passed over a silica gel column, eluted with petroleum ether $-\mathrm{Me}_{2} \mathrm{CO}(4: 1)$, and then purified by semipreparative HPLC with $68 \% \mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$, to obtain $\mathbf{8}(2 \mathrm{mg})$, $12(3 \mathrm{mg})$, and $15(16 \mathrm{mg})$. Fraction 1.1.3 ( 1.1 g ) was applied to RP18, eluted with a $50 \%-100 \% \mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ gradient system, to afford fractions 1.1.3.1-1.1.3.3. Fractions 1.1.3.1 ( 14 mg ) and 1.1.3.2 ( 51 mg ) gave $13(1 \mathrm{mg})$ and $24(21 \mathrm{mg})$, respectively, after being chromatographed over silica gel developed with petroleum ether-EtOAc (7:3). Compounds $20(6 \mathrm{mg})$ and $25(3 \mathrm{mg})$ were obtained from fractions 1.1.3.3 by semipreparative HPLC with $78 \% \mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$. Fraction A2 $(2.4 \mathrm{~g})$ was subjected to Sephadex LH-20 column chromatography using $\mathrm{CHCl}_{3}-\mathrm{MeOH}$ (1:1) for elution to afford fractions 1.2.1-1.2.6. Fraction 1.2.1 ( 522 mg ) was further separated into eight fractions, 1.2.1.1-1.2.1.8, using RP-18 eluted with a $50 \%-100 \% \mathrm{MeOH}-\mathrm{H}_{2} \mathrm{O}$ gradient system. Compounds $5(10 \mathrm{mg}), 16$ $(35 \mathrm{mg})$, and $\mathbf{1 7}(35 \mathrm{mg})$ were obtained from fractions 1.2.1.2, 1.2.1.4, and 1.2.1.6, respectively, by evaporating the eluant under reduced pressure. Fraction 1.2.1.1 ( 47 mg ) was purified over silica gel (petroleum

X-ray Crystallographic Analysis of 15. $\mathrm{C}_{28} \mathrm{H}_{36} \mathrm{O}_{8} ; M=500.7$; monoclinic crystalline system; space group: $P 2_{1} ; a=9.1176(1) \AA, b$ $=23.0376(3) \AA, c=13.1994(2) \AA, \beta=95.226(1)^{\circ}, V=2760.98(6)$ $\AA^{3}, Z=4$, crystal dimensions $0.10 \times 0.10 \times 0.30 \mathrm{~mm}$. The total number of independent reflections measured was 5874 , of which 5713 were observed $\left(|F|^{2} \geq 2 \sigma|F|^{2}\right.$ ). The final indices were $R_{1}=0.0477, w R_{2}=$ $0.1257\left(w=1 / \sigma|F|^{2}\right), S=1.033$. Crystal structure measurements were made by using a MAC DIP-2030 K diffractometer with graphitemonochromated Mo $\mathrm{K} \alpha$ radiation. The data were collected by using the $\omega-2 \theta$ scan technique to a maximum $2 \theta$ value of $114.0^{\circ}$. The crystal structures were solved by direct methods using SHELXS-97, ${ }^{36}$ expanded by using difference Fourier techniques, and refined by the program and method NOMCSDP and full-matrix least-squares calculations. ${ }^{37}$ The non-hydrogen atoms were refined anisotropically, and hydrogen atoms were included at their calculated positions. Drawing of the molecule was achieved with ORTEP. Crystallographic data for the structure of $\mathbf{1 5}$ have been deposited in the Cambridge Crystallographic Data Centre (deposition number CCDC 720855). Copies of the data can be obtained free of charge via www.ccdc.acm.ac.Uk/conts/ retrieving.html (or from the Cambridge Crystallographic Data Centre, 12 Union Road, Cambridge CB21EZ, UK; fax (+44) 1223-336-033; or deposit@ccdc.cam.ac.uk).

Anti-HIV-1 Assay. The cytotoxicity assay against C8166 cells $\left(\mathrm{CC}_{50}\right)$ was assessed using the MTT method, and anti-HIV-1 activity was evaluated by the inhibition assay for the cytopathic effects of HIV-1 $\left(\mathrm{EC}_{50}\right)$. ${ }^{38}$

Acknowledgment. This work was supported financially by the NSFC (No. 30830115 and 20802082), the Major State Basic Research Development Program of China (No. 2009CB522303 and 2009CB940900), a project of the Chinese Academy of Sciences ("Xibuzhiguang" to W.L.X. and No. KSCX1-YW-R-24), the Yong Academic and Technical Leader Rising Foundation of Yunnan Province (2006PY01-47), and the Natural Science Foundation of Yunnan Province (2005XY04 and 2006B0042Q).

Supporting Information Available: ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$, and DEPT NMR spectra of tiegusanins $\mathrm{A}-\mathrm{N}(\mathbf{1} \mathbf{- 1 4})$ and methyl schisantherin $\mathrm{F}(\mathbf{1 5})$, UV, IR, HRESIMS, and 2D NMR spectra of tiegusanin A (1), and CD spectra of tiegusanins $A-M(\mathbf{1} \mathbf{1 3})$ and methyl schisantherin $F(\mathbf{1 5})$. This material is available free of charge via the Internet at http:// pubs.acs.org.
