# Reactions of Substituted 2,3,7-Triazabicyclo[3.3.0]oct-3-ene-4-carboxylic Acid Esters with Halogens* 

A. P. Molchanov, A. V. Stepakov, and R. R. Kostikov<br>St. Petersburg State University, Universitetskii pr. 2, St. Petersburg, 198904 Russia<br>e-mail: mol@am1391.spb.edu<br>Received January 19, 2000

#### Abstract

Substituted 2,3,7-triazabicyclo[3.3.0]oct-3-ene-4-carboxylic acid esters react with chlorine and bromine to give the corresponding 4-halo-2,3,7-triazabicyclo[3.3.0]oct-2-ene-4-carboxylates. Heating of the latter to $120^{\circ} \mathrm{C}$ under reduced pressure leads to elimination of nitrogen molecule and formation of 6 -halo3 -azabicyclo[3.1.0]hexane-6-carboxylates.

1-Halogen-substituted cyclopropanecarboxylic acid esters are synthesized most frequently by reactions of geminal dihalocyclopropanes with organolithium compounds and subsequent treatment of 1-halocyclopropyllithium with carbon dioxide [1], by reactions of diazo compounds with $\alpha$-haloacrylic acid esters [2], and by reactions of diazohaloacetic acid esters with unsaturated compounds [3]. In the present communication we report on the synthesis of 1-halo-1cyclopropanecarboxylates via thermal elimination of nitrogen from dihydropyrazoles [4].

1-Substituted 7-aryl-6,8-dioxo-2,3,7-triazabicyclo-[3.3.0]oct-3-ene-4-carboxylic acid esters Ia-In were obtained from the corresponding diazoacetates and $N$-substituted maleimides [5]. The reactions of esters I with chlorine in chloroform at $0^{\circ} \mathrm{C}$ gave $69-84 \%$ of 7-aryl-4-chloro-6,8-dioxo-2,3,7-triazabicyclo[3.3.0]-oct-2-ene-4-carboxylates as mixtures of endo (IIa-IIg) and exo isomers (IIIa-IIIg) at a ratio of (7-10):1 (Scheme 1). The reaction mixtures obtained from esters Ia-Ie also contained some amount (up to 10\%) of cyclopropane derivatives formed by elimination of nitrogen from the corresponding dihydropyrazoles.

Pure endo isomers IIa, IIb, IId, and IIe were isolated by crystallization. The structure of esters IIa-IIg was derived from the data of elemental analysis and spectral measurements (Tables 1, 2). Compounds IIa-IIe showed in the ${ }^{1} \mathrm{H}$ NMR spectra a singlet from $5-\mathrm{H}$ in the region $\delta 3.6-3.8 \mathrm{ppm}$; the

[^0]corresponding signal of exo isomers IIIa-IIIe was observed in a stronger field (at $\delta 3.43 \mathrm{ppm}$ ). The ${ }^{1} \mathrm{H}$ NMR spectra of compounds IIf and IIg having no substituent in the bridgehead position contain a signal from the $1-\mathrm{H}$ proton at $\delta 6.3-6.5 \mathrm{ppm}$. The position of this signal is typical of protons on $\mathrm{C}^{3}$ in 4,5 -di-hydro- 3 H -pyrazoles. The $5-\mathrm{H}$ signal is located at $\delta 4.0-4.2 \mathrm{ppm}$. The corresponding signals of exo isomers IIIf and IIIg are observed at $\delta$ 6.5-6.8 and 3.8-4.0 ppm, respectively. In the ${ }^{13} \mathrm{C}$ NMR spectrum of ester IIe the $\mathrm{C}^{4}$ signal appears at $\delta_{\mathrm{C}} 105.4 \mathrm{ppm}$. The UV spectra of IIb, IIe, and IIf are characterized by absorption in the region $320-330 \mathrm{~nm}$, which also supports their structure.

The reaction with chlorine of ester Ih having an electron-donor methoxy group in the aromatic ring is accompanied by chlorination of the aromatic substituent. As a result, a 3.5:1 mixture of endo and exo isomers IIh and IIIh is formed. The structure of compounds IIh and IIIh was proved by the elemental analyses (Table 1) and spectral data (Table 2).

Heating of pyrrolopyrazoles IIa-IIh and IIIa-IIIh at $120^{\circ} \mathrm{C}$ under reduced pressure resulted in elimination of nitrogen and formation of substituted 6-chloro-bicyclo[3.1.0]hexane-6-carboxylic acid esters as mixtures of endo (IVa-IVh) and exo isomers ( $\mathbf{V a}-\mathbf{V h}$ ) in up to $87 \%$ yield. ${ }^{1} \mathrm{H}$ NMR study of the reaction mixtures showed that thermolysis of endo isomers II gives only endo-cyclopropanes IV, whereas from exo isomers III mixtures of isomeric cyclopropanes IV and $\mathbf{V}$ are obtained. Thus thermolysis of isomeric mixture II/III is accompanied by considerable increase of the fraction of endo isomer IV in the

Scheme 1.

products. Pure endo isomers IVa, IVb, and IVd-IVg and exo isomer Ve were isolated by column chromatography. Compounds $\mathbf{I i}-\mathbf{I k}$ having an aromatic substituent on $\mathrm{C}^{1}$ reacted with chlorine in dichloroethane at $0^{\circ} \mathrm{C}$ to afford directly endo-cyclopropane carboxylates IVi-IVk. Presumably, the initially formed dihydropyrazole with an aryl group in the bridgehead position is unstable, and it loses nitrogen even at $0^{\circ} \mathrm{C}$. The structure of products IV and $\mathbf{V}$ was confirmed by the data of elemental analysis (Table 1) and spectral measurements (Tables 2, 3). In the IR spectra of these compounds we observed an ester carbonyl band at $1720 \mathrm{~cm}^{-1}$. The position of the $5-\mathrm{H}$ signal in the ${ }^{1} \mathrm{H}$ NMR spectra of IV and $\mathbf{V}$ strongly depends on the $R^{2}$ substituent: when $R^{2}=\mathrm{Me}$, it is located at $\delta 3.4$ 3.5 ppm for endo isomers IVa-IVk and $2.8-2.9 \mathrm{ppm}$ for exo isomers $\mathbf{V a}-\mathbf{V k}$; when $\mathrm{R}^{2}=\mathrm{Ar}$, the $5-\mathrm{H}$ signal shifts downfield to $\sim 4.0 \mathrm{ppm}$ due to deshielding effect of the benzene ring.

Treatment of ester Ia with bromine in chloroform at $60^{\circ} \mathrm{C}$ gave a mixture of products from which we isolated by crystallization $36 \%$ of ethyl exo-4-bromo-1-methyl-6,8-dioxo-7-(4-tolyl)-2,3,7-triazabicyclo-
[3.3.0]oct-2-ene-4-carboxylate (VI). Heating of VI at $120^{\circ} \mathrm{C}$ under reduced pressure resulted in elimination of nitrogen and formation of a mixture of endo and exo isomers VIIa and VIIIa at a ratio of 1:3.

By reactions of pyrrolopyrazoles $\mathbf{I j} \mathbf{j} \mathbf{I n}$ with bromine in acetic acid at $70^{\circ} \mathrm{C}$ we obtained mixtures of endo- and exo-6-bromo-2,4-dioxo-3-azabicyclo-[3.1.0]hexane-6-carboxylates VIIb-VIIf and VIIIbVIIIf. The ratio of endo and exo isomers was 2.3 (VIIb/VIIIb), 0.7 (VIIc/VIIIc), 0.9 (VIId/VIIId), 1.1 (VIIe/VIIIe), and 12 (VIIf/VIIIf). The structure of brominated cyclopropanes VII and VIII was established on the basis of their elemental compositions and spectral data. The signal from the CH proton of the cyclopropane ring in the ${ }^{1} \mathrm{H}$ NMR spectra of endo isomers VIIa-VIIf was observed in a weaker field relative to the corresponding signal of the exo isomers due to deshielding effect of the cis-bromine atom, $\delta$, ppm: 3.58 (VIIa), 3.90-4.10 (VIIb-VIIe), 3.43 (VIIf) and 2.85 (VIIIa), 3.42-3.60 (VIIIb-VIIIe), 2.90 (VIIIf).

Our results suggest a mechanism involving electrophilic substitution of hydrogen at the nitrogen atom

[^1]Scheme 2.

respectively. Compounds XIa-XIc and XIIa-XIIc were identical to those reported previously [6]. Nonstereospecific reduction of bromocyclopropanes with zinc was also reported in [7].

As shown above, compounds $\mathbf{I j}-\mathbf{I n}$ having a substituent in the bridgehead position react with bromine in acetic acid at $70^{\circ} \mathrm{C}$ to give isomeric bromocyclopropanes VIIb-VIIf and VIIIb-VIIIf. On the other hand, bromination of compounds If and Io-Iv (which lack substituent on $\mathrm{C}^{1}$ ) in acetic acid or chloroform on heating yields pyrrolopyrazoles XIIIa-XIIII (Scheme 4). The sane products were obtained by the action of triethylamine on chlorinated compounds IIf, IIg, and IIh. The structure of compounds XIIIa-XIIII is confirmed by their elemental analyses and IR and ${ }^{1} \mathrm{H}$ NMR spectra (Tables 1,2). In the IR spectra of XIIIa-XIIII we observed absortion at $3400 \mathrm{~cm}^{-1}$ due to stretching vibrations of the NH bond, and their ${ }^{1} \mathrm{H}$ NMR spectra contain a signal at $\delta 15.5 \mathrm{ppm}$ belonging to the NH proton. The reaction of compound $\mathbf{I h}$ with bromine at $70^{\circ} \mathrm{C}$ is accompanied by
substitution of hydrogen in the aromatic ring by bromine to afford product XIIIj. Introduction of bromine into the aromatic ring was also observed for compound Iv at $70^{\circ} \mathrm{C}$, whereas at $20^{\circ} \mathrm{C}$ pyrrolopyrazole XIIIk is formed.

## EXPERIMENTAL

The IR spectra were obtained on a UR-20 spectrophotometer from $2 \%$ solutions in chloroform. The ${ }^{1} \mathrm{H}$ NMR spectra were recorded on a Bruker AM-300 instrument ( 300 MHz ) from $2 \%$ solutions in $\mathrm{CDCl}_{3}$ or DMSO- $d_{6}$.

Ethyl 4-chloro-1-methyl-6,8-dioxo-7-(4-tolyl)-2,3,7-triazabicyclo[3.3.0]oct-2-ene-4-carboxylate (IIa). A stream of gaseous chlorine was passed at $0^{\circ} \mathrm{C}$ through a solution of $0.35 \mathrm{~g}(1.1 \mathrm{mmol})$ of compound $\mathbf{I a}$ in 30 ml of dry chloroform until saturation $(\sim 1 \mathrm{~min})$. The solvent was removed under reduced pressure at room temperature, and the residue was recrystallized from methanol. Yield of IIa 0.31 g

${ }^{\text {a }}$ 1-H.
${ }^{\mathrm{b}} \mathrm{C}_{2} \mathrm{H}_{5}$.
(71\%). Esters IIb-IIg and IIIb-IIIg were obtained in a similar way.

Ethyl 6-chloro-1-methyl-2,4-dioxo-3-(4-tolyl)-3-azabicyclo[3.1.0]hexane-6-carboxylate (IVa). Compound IIa, $0.20 \mathrm{~g}(0.57 \mathrm{mmol})$, was heated at $120^{\circ} \mathrm{C}$ under a residual pressure of 20 mm until nitrogen no longer evolved ( 5 min ). The resulting material was cooled and recrystallized from methanol. Yield of ester IVa 0.134 g . Compounds IVb-IVg were obtained in a similar way.

Methyl 6-chloro-1-(4-chlorophenyl)-2,4-dioxo-3-phenyl-3-azabicyclo[3.1.0]hexane-6-carboxylate (IVj). A stream of dry gaseous chlorine was passed at $0^{\circ} \mathrm{C}$ through a solution of $0.3 \mathrm{~g}(0.78 \mathrm{mmol})$ of compound $\mathbf{I j}$ in 30 ml of anhydrous 1,2-dichloroethane until saturation ( $\sim 2 \mathrm{~min}$ ). The solvent was evaporated at room temperature, and the residue was recrystallized from ethanol. Yield of ester IVj 0.27 g ( $88 \%$ ). Compounds IVi and IVk were obtained by a similar procedure.

Ethyl 4-bromo-1-methyl-6,8-dioxo-7-(4-tolyl)-2,3,7-triazabicyclo[3.3.0]oct-2-ene-4-carboxylate (VI). A mixture of $0.6 \mathrm{~g}(2 \mathrm{mmol})$ of compound Ia and 1.6 g of bromine in 30 ml of dry chloroform was heated for 3 h . The mixture was cooled and treated
with a solution of $\mathrm{Na}_{2} \mathrm{SO}_{3}$, the organic phase was separated, dried over $\mathrm{MgSO}_{4}$, and evaporated, and the residue was recrystallized from methanol. Yield of ester VI 0.27 g ( $36 \%$ ).

Ethyl 6-bromo-1-methyl-2,4-dioxo-3-(4-tolyl)-3-azabicyclo[3.1.0]hexane-6-carboxylate (isomeric mixture VIIa/VIIIa). Ester VI, $0.20 \mathrm{~g}(0.5 \mathrm{mmol})$, was heated at $130^{\circ} \mathrm{C}$ under a residual pressure of 20 mm until nitrogen no longer evolved ( 4 min ). The resulting material was cooled and recrystallized from methanol. Yield of VIIa/VIIIa $0.11 \mathrm{~g}(61 \%)$.

Methyl 6-bromo-3-(3,4-dichlorophenyl)-1-methyl-2,4-dioxo-3-azabicyclo[3.1.0]hexane-6-carboxylate (VIIf). A mixture of $0.7 \mathrm{~g}(2 \mathrm{mmol})$ of compound In and 1.6 g of bromine in 20 ml of glacial acetic acid was heated for 5 h at $70^{\circ} \mathrm{C}$. The solvent and excess bromine were distilled off, and a mixture of diethyl ether and hexane (1:1) was added to the residue for crystallization. The precipitate was filtered off and recrystallized from ethanol. Yield of ester VIIf 0.5 g ( $63 \%$ ). Isomer ratio VIIf: VIIIf 12:1 (before recrystallization). Esters VIIb-VIIe and VIIIb-VIIIe were synthesized in a similar way; according to the ${ }^{1} \mathrm{H}$ NMR data, the isomer ratio was 2.3 (VIIb/VIIIb), 4.1 (VIIc/VIIIc), 0.9 (VIId/VIIId), 1.1 (VIIe/VIIIe).

Methyl 1-(4-chlorophenyl)-3-phenyl-3-azabicy-clo[3.1.0]hexane-6-carboxylate (XIa/XIIa). A mixture of $62 \mathrm{mg}(0.25 \mathrm{mmol})$ of chlorocyclopropane $\mathbf{I V j}$ and 0.7 g of zinc dust in 15 ml of glacial acetic acid was heated for 1 h . The mixture was cooled and filtered, acetic acid was removed from the filtrate under reduced pressure, the residue was dissolved in chloroform, the chloroform solution was filtered, washed with a $10 \%$ solution of $\mathrm{Na}_{2} \mathrm{CO}_{3}$, dried over $\mathrm{MgSO}_{4}$, and evaporated, and the residue was purified by column chromatography on silica gel (eluent hexaneether, $1: 2$ by volume). Yield of XIa/XIIa $69 \%$. Isomeric mixtures XIb/XIIb and XIc/XIIc were isolated in $71 \%$ and $75 \%$ yield, respectively.

Ethyl 7-cyclohexyl-6,8-dioxo-3,3,7-triazabicyclo[3.3.0] octa-1(5),3-diene-4-carboxylate (XIIIa). A solution of $230 \mathrm{mg}(0.8 \mathrm{mmol})$ of compound If and 0.2 ml of bromine in 10 ml of chloroform was heated for 3 h . The mixture was cooled and washed with a solution of $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$, the organic phase was separated, dried over $\mathrm{MgSO}_{4}$, and evaporated, and the residue was recrystallized from hexane-acetone. Yield of ester XIIIa 210 mg ( $91 \%$ ). Compounds XIIIb and XIIIg were synthesized in a similar way.

Ethyl 6,8-dioxo-7-phenyl-3,3,7-triazabicyclo-[3.3.0]octa-1(5),3-diene-4-carboxylate (XIIIc). A mixture of $1 \mathrm{~g}(3.5 \mathrm{mmol})$ of compound $\mathbf{I p}$ and 1 ml of bromine in 30 ml of acetic acid was heated
for 2 h at $60-70^{\circ} \mathrm{C}$. The mixture was cooled and poured into 100 ml of water, and the precipitate was filtered off, washed with a solution of $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ and water, and recrystallized from aqueous ethanol. Yield of XIIIc $0.5 \mathrm{~g}(52 \%)$. Esters XIIId-XIIIf and XIIIiXIIIk were synthesized in a similar way.

Ethyl 7-(3-chlorophenyl)-6,8-dioxo-3,3,7-tri-azabicyclo[3.3.0]octa-1(5),3-diene-4-carboxylate (XIIIh). A mixture of $70 \mathrm{mg}(0.2 \mathrm{mmol})$ of compound IIg and 40 mg of triethylamine in 7 ml of chloroform was stirred for 2 h . The mixture was washed with $10 \%$ hydrochloric acid, and the organic phase was dried over $\mathrm{MgSO}_{4}$. The solvent was evaporated, and the residue was recrystallized from methanol. Yield of ester XIIIh 60 mg ( $86 \%$ ). Compound XIIII was obtained in a similar way.
