

Potential Anticancer Compounds. I.
Synthesis of Thiodiacetic Acid Hydrazides and
Homologs

HANS ZIMMER AND EDWARD SHAHEEN

Received February 2, 1959

The activity of bis(2-chloroethyl) sulfide and of several nitrogen analogs (nitrogen mustards) against certain types of cancer is well established.¹ However, besides a more or less pronounced toxicity, all of these compounds suffer from several unfavorable physiological properties. Therefore, the synthesis of compounds was undertaken which have

the structural element S $\begin{matrix} / & (CH_2)_n - \\ & \\ \backslash & (CH_2)_n - \end{matrix}$ of mustard oil

but which have instead of the Cl atom the groups

$\begin{matrix} O \\ || \\ -C-NHN=R \end{matrix}$ (R = aralkylidene) or $\begin{matrix} O \\ || \\ -C- \\ | \\ NHNHR \end{matrix}$ (R = H or phenyl). It was hoped that these compounds would retain anticancer activity while being less toxic than the mustards. The

$\begin{matrix} O \\ || \\ -C-NHN- \end{matrix}$ group was chosen to provide the compounds with some hydrophilic solubility. Preliminary tests against three types of experimental tumors in mice, adenocarcinoma (Ca = 755), sarcoma (Sa = 180), and leukemia (L = 1210), however, showed that the compounds exhibit no activity against these tumor systems.

The compounds were prepared by established methods² and are compiled in Tables I and II. The corresponding bromosubstituted fatty acid es-

^a Recrystallized from methanol. ^b Recrystallized from methanol/dimethylformamide. ^c W. Reppe, *Ann.*, **596**, 158 (1955), m.p. 130°. ^d Recrystallized from ethanol/dimethylformamide. ^e The analysis could not be improved by further recrystallization.

ters were treated with sodium sulfide in aqueous ethanol. The thiodiacid esters were isolated and, on reaction with excess hydrazine, furnished the corresponding hydrazides. The latter were converted into the aralkylidene hydrazides by the method of Zimmer and George.³ The hydrazides are characterized by an extremely low solubility in most of the common solvents. They are, however, soluble in *N,N*-dimethylformamide and can be recrystallized from this solvent. They all have rather unsharp melting points and melt with considerable decomposition. Therefore, these derivatives are not well suited for possible identification of carbonyl compounds. In the preparation of the phenylhydrazides,⁴ it was found advantageous to use the acids rather than the esters as starting materials.

EXPERIMENTAL

Melting points are uncorrected. Microanalyses are by A. Bernhardt, Microanalytisches Laboratorium im Max-Planck-Institut, Mulheim/Ruhr, Germany.

Materials. Generally, Eastman White Label products or comparable grades were employed without further purification. Ethyl 4-bromobutyrate was obtained from Fluka, A.G., Buchs, Switzerland.

The preparations of the hydrazides were generally performed as follows: To a solution of the corresponding thiodiacid diester (0.05 mole) in 25 ml. absolute methanol, a 30% excess of hydrazine hydrate (85%) was added. After 3 drops of glacial acetic acid had been added as a catalyst, the mixture was refluxed for about 3 hr. After the mixture was cooled, an additional 25 ml. of absolute methanol was added, and the mixture was left overnight for crystallization. An additional crop of compound could be obtained

by keeping the mother liquor for a short period in the refrigerator. The compounds were recrystallized from a minimum amount of *N,N*-dimethylformamide (Table II).

3,3'-Thiodipropionic acid, bis(*p*-dimethylaminobenzylidenehydrazide). To a solution of 2.67 g. (0.015 mole) of 3,3'-thiodipropionic acid dihydrazide in 40 ml. of water, a solution of 5.97 g. (0.04 mole) of *p*-dimethylaminobenzaldehyde in 70 ml. of ethanol was added. After a brief period, crystals began depositing and were collected after about 1 hr. They were washed with ethanol and air-dried. Yield, 5.69 g. (81%), m.p. 247-250°. The analytical sample was recrystallized from *N,N*-dimethylformamide, m.p. 247-250° (dec.). The remaining aralkylidene hydrazides were prepared similarly (Table I).

3,3'-Thiodipropionic acid, bis(phenylhydrazide). To a solution of 6.5 g. phenylhydrazine in 25 ml. tetrahydrofuran, 3.56 g. (0.02 mole) of 3,3'-thiodipropionic acid was added. After being refluxed for 7 hr., the mixture was cooled and the deposited phenylhydrazide was filtered and washed with ether. Yield, 5.02 g. (70%), m.p. 197-200°. The analytical sample was recrystallized from a minimum amount of *N,N*-dimethylformamide, m.p. 204-206°. The remaining phenylhydrazides were prepared similarly (Table II).
