#### Abstract

Enamino phosphonium salts 2 are obtained by 1,2-addition of hydrogen chloride to N -vinylic phosphazenes $\mathbf{1}$ derived from triphenylphosphine. Aza-Wittig reaction of phosphazenes $\mathbf{1}$ derived from triphenyl phosphine and $\mathbf{6}$ derived from di phenylmethyl phosphine with aldehydes $\mathbf{3}$ leads to the formation of 2 -azadienes $\mathbf{7}$. Reaction of azadienes $\mathbf{7}$ with enamines affords dihydropyridines $\mathbf{9}$ and $\mathbf{1 1}$, pyridines 12, and bicyclic nitrogen heterocycles $\mathbf{1 5 - 1 8}$ in a regioselective fashion, while heterodiene $\mathbf{2 0}$ reacts in the same way with pyrrolidinocyclohexanone giving 1-azaphenanthrene compound 21. Reaction of enamino phosphonium salts $\mathbf{2}$ with aldehydes $\mathbf{3}$ gives symmetrical dihydropyridines 5.

## Introduction

Phosphazenes ${ }^{1}$ represent an important class of compounds and have attracted a great deal of attention in recent years because of their broad range of applications. The utility of N -vinylic phosphazenes ${ }^{2}$ has been demonstrated in the synthesis of functionalized imine compounds, such as electronically neutral ${ }^{3}$ and electron-poor 2 -azadienes, ${ }^{4}$ and as key intermediates in the preparation of heterocycles, such as 1,3 -oxazines, ${ }^{3}$ pyridine derivatives, ${ }^{4 a, b-7}$ and bicyclic ${ }^{8}$ and polycyclic compounds, ${ }^{2,9}$ as well as in elegant routes toward both the preparation of biol ogi cally active natural products and the construction of the framework of pharmacol ogically active alkaloids. ${ }^{10}$
We have been involved in the study of simple and functionalized phosphazenes ${ }^{1 \mathrm{~b}}$ as well as in their use in the preparation of acyclic ${ }^{3,4,11}$ and heterocyclic com-

[^0]pounds. ${ }^{6,8,12}$ In some cases the reaction involves the phosphazene group,, , $4,111 \mathrm{ln}, 12 \mathrm{ld}$ while in other examples it remains unaffected. ${ }^{4 b, 112,12 \mathrm{a}} \mathrm{I}$ n the case of N -vinylic phosphazenes, an adjacent double bond in conjugation with the phosphazene moiety introduces the interesting problem of site selectivity: reaction at the nitrogen (1,2addition) of the phosphazene group ${ }^{1}$ versus reactions at the $\gamma$-C atom (1,4-addition). ${ }^{2,44,7 a, 13}$ We have reported that the influence of substituents of the phosphorus atom in N -vinylic phosphazenes I can play an important role in the reactivity pattern observed with carbonyl compounds, 4 bb since reaction of phosphazenes derived from triphenylphosphine ( $\mathbf{I}, \mathrm{R}^{1}=\mathrm{Ph}$ ) with carbonyl compounds gives the monoadduct II (1,4-addition), while phosphazene derived from diphenylmethylphosphine ( $\mathbf{I}, \mathrm{R}^{1}=\mathrm{Me}$ ) undergoes aza-Wittig reaction with carbonyl compounds and leads to the formation of 2-azadienes III (Scheme 1).

A recent publication ${ }^{14}$ has reported that N -vinylic phosphazenes IV ( $\left.\mathrm{R}^{1}=\mathrm{Ph}, \mathrm{R}^{3}=\mathrm{H}\right)$, with an ethoxycarbonyl group at the $\beta$-position and prepared by Staudinger reaction of $\beta$-azido carboxylate ${ }^{15}$ with phosphines in a similar way to that described ${ }^{4 a}$ for $I V\left(R^{1}=P h, R^{3}=M e\right)$, reacted with aldehydes. This reaction was reported as involving an initial nucleophilic attack of the $\gamma$-C atom ( 1,4 -addition) of the phosphazene on the aldehyde, in contrast to the behavior of conjugated phosphazenes with carbonyl compounds to give 2 -azadienes. ${ }^{4 \mathrm{a}}$ These results have prompted us to report our own study on the ambident reactivity (1,2- and 1,4-addition) of phos-

[^1]Scheme 1. 1,2-Addition versus 1,4-Addition of N -Vinylic Phosphazenes I with Aldehydes

phazenes IV ( $\left.\mathrm{R}^{1}=\mathrm{Ph}\right)$ derived from triphenylphosphine with hydrogen chloride. The regioselective aza-Wittig reaction (1,2-addition) of phosphazenes IV ( $\mathrm{R}^{1}=\mathrm{Me}$ ) derived from diphenylmethylphosphine with aldehydes and the isolation of the corresponding 2-azadiene derivative were also studied. This is consistent with the reported behavior not only of these kinds of phosphazenes ${ }^{4 a}$ derived from $\beta$-amino acids but also that of N -vinylic phosphazenes derived from $\alpha$-amino acids ${ }^{4 c, \mathrm{~d}}$ and that of other N -vinylic phosphazenes. ${ }^{3,4 \mathrm{~b}}$ Moreover, we report here that 2-azadienes can be used as key intermediates in the synthesis of heterocyclic compounds derived from $\beta$-amino acids and of polycydic nitrogen derivatives.

## Results and Discussion

Regioselective 1,2-Addition of HCl to Phosphazenes 1 Derived from Triphenylphosphine. Hydrogen chloride was bubbled through a solution of N vinylic phosphazenes $\mathbf{l a}\left(\mathrm{R}^{1}=\mathrm{H}\right)$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{Et}_{2} \mathrm{O}$ to yield hygroscopic enamino phosphonium salt $\mathbf{2 a}$ in a regioselective fashion. The hygroscopic compound $\mathbf{2 a}$ was not isol ated but characterized by its spectroscopic properties. The ${ }^{31} \mathrm{P}$ NMR spectrum of $\mathbf{2 a}$ showed an absorption at $\delta_{\mathrm{P}} 37.99 \mathrm{ppm}$. The signal for the $\mathbf{2 a}$ vinylic protons appeared at $\delta_{\mathrm{H}} 7.02$ and 6.40 ppm , respectively, with a coupling constant of ${ }^{3} \mathrm{JH}=13.6 \mathrm{~Hz}$. This is consistent with the E-configuration of the carbon-carbon double bond. ${ }^{4 a, 16}$ The olefinic carbons gave a singlet at $\delta_{\mathrm{C}} 139.5$ and a doublet at $\left.105.1 \mathrm{ppm}\left({ }^{3}\right)_{\text {pC }}=11.1 \mathrm{~Hz}\right)$. The crude 2a was used without purification. In the case of 3-methylsubstituted N -vinylic phosphazenes $\mathbf{1 b}\left(\mathrm{R}^{1}=\mathrm{Me}\right)$ the reaction with HCl gave a mixture of both Z - and E enamines $\mathbf{2 b}$ in a $1: 1$ ratio (Scheme 2 ).

Aza-Wittig Reaction of Phosphazenes 6 Derived from Diphenylmethylphosphine with Aldehydes 3 (1,2-Addition versus 1,4-Addition). A recent report describes the reaction of N -vinylic phosphazene $\mathbf{1 a}$ with aromatic aldehydes 3, in o-xylene at $160{ }^{\circ} \mathrm{C}$, in the presence of palladium on charcoal and in a sealed tube, giving 4-aryl-3,5-(diethoxycarbonyl)di hydropyridines 5 in

4

5
moderate yields. ${ }^{14}$ The authors suggest that these heterocycles 5 could be formed by an initial addition of aldehydes 3 on the $\beta$-carbon atom of the N -vinylic phosphazene 1a (1,4-addition) to give 1,2,5-oxaazaphosphorane 4 followed by regioselective attack of a second molecule of the phosphorane la with loss of triphenylphosphine oxide (Scheme 3).
We found that the room-temperature reaction of N vinylic phosphazene 6a (containing an ethoxycarbonyl group as substituent in the 4 position) with p-nitrobenzaldehyde at room temperature gave the aza-Wittig product (1,2-addition) 7aa in excellent yield (Scheme 4, Table 1, entry 1). Spectroscopic data and mass spectrometry of compound 7aa indicate that only the E,Z-isomer was obtained. The ol efinic protons of 7aa showed absorptions at $\delta 7.88$ and $6.23 \mathrm{ppm}\left({ }^{3}{ }^{3} \mathrm{нн}=13.0 \mathrm{~Hz}\right)$ as doublets, and the iminic proton appeared at $\delta 8.44 \mathrm{ppm}$ as a singlet. The selective saturation of the singlet at 8.44 ppm afforded positive NOE over the adjacent vinylic proton without interaction with the olefinic proton in the 4 position (Scheme 4). This NOE observation was consistent with the E stereochemistry of azadiene 7aa. Heterodienes 7ab-ae (Table 1, entries 2-5) are unstable during distillation and/or chromatography and wereused without purification. ${ }^{17}$
The scope of this aza-Wittig reaction was not limited to the phosphazenes derived from ethyl $\beta$-azidoacrylate, given that 3-methyl- 6b ( $\mathrm{R}^{1}=\mathrm{Me}$ ) and 3-phenylsubstituted $N$-vinylic phosphazenes 6c ( $\mathrm{R}^{1}=\mathrm{Ph}$ ) also reacted with aldehydes leading to the formation of

## Scheme 4. 1,2-Dihydropyridines 9 Formation through [4 + 2] Cycloaddition Reaction of Azadienes 7 and Phosphazenes 1 and 6

azadienes 7ba,bc and 7ca,cb, obtained mainly as Eimine isomers (Table 1, entries 6 and 11). In the case of $\mathbf{7 b b}, \mathbf{7 b c}$, and $\mathbf{7 c b}$ a mixture of E - and Z-imine isomers (Table 1, entries 8, 10, and 13) was obtained. Azadienes 7ba, 7bb, 7ca, and 7cb (Table 1, entries 7, 9, 12, and 14) were obtained in moderate yields from N -vinylic phosphazenes derived from triphenylphosphine 1b,c when the reaction of $\mathbf{1 b}, \mathbf{c}$ with aldehydes $\mathbf{3}$ was performed at $100^{\circ} \mathrm{C}$ without sol vent. Treatment of 2 equiv of phosphazenes $\mathbf{6 b}$ and $\mathbf{l b}, \mathbf{c}$ derived from both diphenylmethylphosphine and triphenylphosphine respectively with 1 equiv of aromatic aldehydes $\mathbf{3}$ gave 2-aryl-3,4(dialkoxycarbonyl)dihydropyridines 9 (Scheme 4, route a) in good yields and in a regi oselective fashion (Table 2, entries 1-5). The process could start with an aza-Wittig reaction of the phosphazenes $\mathbf{1}$ or $\mathbf{6}$ and aldehydes $\mathbf{3}$ to give azadienes $\mathbf{7}$, which then undergo a regioselective [4 +2 cycloaddition reaction with a second molecule of phosphazenes $\mathbf{1}$ or $\mathbf{6}$, which act as dienophile. Thermal
elimination of the iminophosphorane from the cycloadduct $\mathbf{8}$ could give dihydropyridines 9 (Scheme 4).
Cycloaddition Reaction of Azadienes 7 with Enamines. To test the synthetic usefulness of the new azadienes 7 as reagents for heterocydic synthesis ${ }^{18}$ we explore cycl oaddition reactions of electron deficient 2-azadienes $\mathbf{7}$ (Scheme 4). At first, the reaction of azadienes $\mathbf{7}$ with conjugated phosphazenes $\mathbf{6}$ was studied. Treatment of azadienes 7aa,ae with a second molecule of phosphazene 6a also led to di hydropyridines 9af, ag (Scheme 4, route b, Table 2, entries 6 and 7). This behavior suggests that, in the reaction of 2 equiv of phosphazenes 6 and 1 with aldehydes to obtain dihydropyridines 9 (Scheme 4, route a), azadienes 7 are involved. Dihydropyridines $9\left(R^{1}=H, R^{2}=R^{4}\right)$ may alternatively be obtained through reaction of azadienes $\mathbf{7}$ with $\beta$-enamino esters $\mathbf{1 0}$ (Scheme 5). Reaction of azadienes $\mathbf{7}$ with enamines $\mathbf{1 0}$ led to the formation of dihydropyridines 9 ( $R^{1}=H, R^{2}=R^{4}=E t$ ) (Table 2, entries 8 and 9). Likewise, dihydropyridines $\mathbf{1 1}\left(R^{2} \neq R^{4}\right)$ can be obtained when azadienes $\mathbf{7}$ react with enamines $\mathbf{1 0}$ derived from other carboxylic esters ( $R^{2} \neq R^{4}$, Table 2, entries $10-$ 15). Calcium channel antagonist action of 1,2-dihydropyridines derived from $\beta$-amino acids has been reported. ${ }^{19}$ Dihydropyridines $\mathbf{1 1}$ underwent aromatization to give functionalized pyridines $\mathbf{1 2}$ by means of oxidation with quinone (Table 2, entries 16 and 17). Nevertheless pyridines 12ac,bd were directly obtained when azadienes 7ab,bc were used (Table 2, entries 18 and 19). The reduction of 2-o-nitrophenyl-substituted pyridines 12ac,bd with $\mathrm{Fe} / \mathrm{HOAc}$ affords benzonaphthyridinones 13a,b (Scheme 6).
The reaction of heterodienes $\mathbf{7}$ with more reactive enamines was also performed. Pyrrol idinecyclohexanone 14a $(\mathrm{n}=2)$ reacts with azadienes 7aa,ad $\left(\mathrm{R}^{1}=H\right)$ at

## Scheme 5. Reaction of Azadienes 7 with Enamines 10 and 14

room temperature affording 1,2,6,7,8,8a-hexahydroisoquinoline compounds derived from $\beta$-amino acids 15aa, ab (Table 3, entries 1 and 2). Spectral data were in agreement with the enamine structure of a bicydlic heterocycle. In the ${ }^{1} \mathrm{H}$ NMR spectrum of 15aa $\left(\mathrm{R}^{1}=\mathrm{H}\right)$ the signal for $3-\mathrm{H}$ appeared at $\delta_{\mathrm{H}} 7.59$ as a doublet with a coupling constant of 6.3 Hz , while 1-H and 5-H showed absorptions at $\delta_{\mathrm{H}} 3.95\left({ }^{(3)} \mathrm{нн}=10.8 \mathrm{~Hz}\right)$ and $6.62 \mathrm{ppm}\left({ }^{3}\right) \mathrm{fн}=1.8$ Hz ) as doublets. Oxidation of bicyclic heterocycles 15aa,ab with quinone led to the formation of 5,6,7,8-tetrahydroisoquinoline 16aa,ab derived from $\beta$-amino acids (Table 3, entries 3 and 4). Pyrrolidinecyclopentanone 14b

Scheme 6. Formation of Benzo[h][1,6]naphthyridin-5-ones 13

ac: $R^{1}=H, R^{2}=E t$
bd: $\mathrm{R}^{1}=\mathrm{Me}, \mathrm{R}^{2}=\mathrm{Me}$
$(\mathrm{n}=1)$ reacted similarly with azadienes 7aa,ad $\left(\mathrm{R}^{1}=\right.$ H) to give bicyclic compounds 17aa,ab (Table 3, entries 8 and 9). Aromatization of these nitrogen heterocycles 17 provided bicyclic pyridine compounds 18aa,ab in excellent yields (Table 3, entries 10 and 11). 3-M ethyl7ba,bb ( $\mathrm{R}^{1}=\mathrm{Me}$ ) and 3-phenyl-substituted azadienes 7ca $\left(R^{1}=P h\right)$ also reacted with pyrrolidinecyclohexanone 14a $(\mathrm{n}=2)$ to yield 5,6,7,8-tetrahydroisoquinoline compounds 16 (see Table 2, entries 5-7).

Aza-Wittig Reaction of Phosphazenes 19 with Aldehydes (1,2-Addition) and Preparation of Phen-antridin-1-one Derivative 21. Aza-Wittig reaction of phosphazenes 6 and aldehydes $\mathbf{3}$ was extended to conjugated phosphazenes 19. N-vinylic phosphazene derived from cyclic ketones 19a ( $\mathrm{R}^{1}=\mathrm{Me}$ ) was prepared by Staudinger reaction ${ }^{1 b}$ of diphenylmethylphosphine and 3-azidocyclohex-2-enone. ${ }^{20}$ Compound 19a reacts with p-nitrobenzaldehyde at $45^{\circ} \mathrm{C}$ and gave the aza-Wittig reaction (1,2-addition). Azadiene $\mathbf{2 0}$ was not isolated and was used "in situ" without isolation in a [4 + 2] cycloaddition reaction with pyrrolidinecyclohexanoneenamine 14a leading to the formation of the tricydic phenantridin-1-one derivative 21. These findings are in contrast with the reported reaction of phosphazenes derived from triphenylphosphine 19b ( $\mathrm{R}^{1}=\mathrm{Ph}$ ) with aldehydes in o-xylene at $160^{\circ} \mathrm{C}$ in a sealed tube, to afford 9-azaantracene compounds $\mathbf{2 2}^{14}$ (Scheme 7).

a Purified by chromatography.
Reaction of Enamino Phosphonium Salts 2 Derived from Phosphazenes 1 with Aldehydes 3. Preparation of Symmetrical Dihydropyridines 5. To test the 1,4 addition versus the 1,2-addition reaction of conjugated phosphazenes derived from triphenylphosphine $\mathbf{1}$, we explored the reactivity of phosphazene $\mathbf{1}$ and their derivatives $\mathbf{2}$ with aldehydes $\mathbf{3}$. Neither symmetric 1,4-dihydropyridines 5 nor asymmetric 1,4-dihydropyridines 9 were obtained by the reaction of phosphazene 1a $\left(\mathrm{R}^{1}=\mathrm{H}\right)$ with aromatic aldehydes at $60^{\circ} \mathrm{C}$, and the starting phosphazene la was recovered. However, the reaction of enamino phosphonium salts $\mathbf{2 a}$, prepared by acid treatment of N -vinylic phosphazene 1a $\left(\mathrm{R}^{1}=\mathrm{H}\right)$, with aromatic and heteroaromatic aldehydes in refluxing $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ led to the formation of 4 -aryl-3,5-diethoxy-carbonyl-1,4-di hydropyridines 5aa,ab (Table 4, entries 1 and 2). Theformation of dihydropyridines 5aa,ab could be explained by an initial 1,4-addition of the aldehyde to the $\gamma$-carbon atom of the phosphonium salt $\mathbf{2 a}$ to give 1,2,5-oxaazaphosphorane 4 followed by regioselective

Scheme 8. Preparation of Symmetrical 1,4-Dihydropyridines 5

attack ${ }^{2,14}$ of a second molecule of the phosphonium salt 2a (Scheme 8). Dihydropyridines 5aa,ab were characterized and their structures were consistent with reported symmetrical heterocycles. ${ }^{14}$ This reaction can also be extended to 3-methyl-substituted phosphonium salt 2b ( $\mathrm{R}^{1}=\mathrm{CH}_{3}$ ), to give 3-methyl-substituted symmetrical dihydropyridines 5ba-bd (Table 4, entries 3-6). This methodology has been also used in the preparation (Table 4, entry 6) of the biologically active nifedipine 5bd used for the treatment of coronary diseases. ${ }^{21}$ The synthesis of dihydropyridines 5 does not require the isolation and purification of phosphonium salts $\mathbf{2}$, and they can also be obtained when phosphazenes $\mathbf{1}$ are directly treated with acid with subsequent addition of aldehydes. Therefore, this strategy offers a new approach to the synthesis of symmetrical dihydropyridines 5 under mild reaction conditions. 1,4-Dihydropyridines are compounds with interesting therapeutic ${ }^{22}$ and biorganic ${ }^{23}$ applications.

We conclude that N -vinylic phosphazenes 1 derived from triphenylphosphine are ambident nucleophilic reagents. They are suitable for 1,2-addition with hydrogen chloride. The nucleophilic character of the nitrogen atom of N -vinylic phosphazenes can be increased when they are derived from diphenylmethylphosphine 6, and these undergo aza-Wittig reaction (1,2-addition) with aldehydes

[^5]in a regioselective fashion. Isolated azadienes 7 are intermediates in the preparation not only of monocydic 1,2-dihydropyridines 9 and pyridines 12 but also of bicyclic nitrogen heterocycles 15-18 derived from $\beta$-amino acids, as well as of phenanthridin-1-one 21 and benzonaphthyridinone derivatives 13. The efficient synthesis of symmetrical dihydropyridines 5 here described provides an easy approach to the preparation of these kinds of compounds, avoiding the use of high temperatures $\left(160{ }^{\circ} \mathrm{C}\right) .{ }^{14} \mathrm{It}$ is worth noting that pyridine compounds derived from $\beta$-amino acids are useful heterocycles not only for their biological activities ${ }^{24}$ but also because the pyridine nucleus is a structural unit appearing in many natural products. ${ }^{25}$

## Experimental Section

General Methods. All reactions were carried under nitrogen. Dioxane and diethyl ether were distilled from benzophenone ketyl and sodium, while $\mathrm{CHCl}_{3}$ and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ were distilled from $\mathrm{P}_{2} \mathrm{O}_{5}$. Phosphazenes $\mathbf{1}$ and $\mathbf{6}$ were synthesized according to literature procedures. ${ }^{40,15} \mathrm{~F}$ or new phosphazenes $\mathbf{1 a}, \mathbf{c}$ and $\mathbf{6 c}$, see the Supporting Information.

General Procedure for the Preparation of Phosphonium Salts 2. Hydrogen chloride was bubbled through a $0-10$ ${ }^{\circ} \mathrm{C}$ solution of phosphazene $\mathbf{1}(1.13 \mathrm{~g}, 3 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10$ $\mathrm{mL}) / E \mathrm{t}_{2} \mathrm{O}(20 \mathrm{~mL})$, and the mixture was stirred at $0-10{ }^{\circ} \mathrm{C}$ for 30 min . Evaporation of solvent under reduced pressure afforded to the enamino phosphonium salt 2.
((2-(Ethoxycarbonyl)-1-ethenyl)amino)triphenylphosphonium Chloride (2a). The general procedure was followed using phosphazene la to give $\mathbf{2 a}(\mathbf{E})$. The reaction product is unstable to recrystalation or chromatography and therefore was not isolated and used for the following reactions: ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 12.51(\mathrm{~s}, 1 \mathrm{H}), 7.89-7.47(\mathrm{~m}, 15 \mathrm{H}), 7.02$ $\left(\mathrm{dd},{ }^{3}{ }^{3} \mathrm{H}=13.6 \mathrm{~Hz},{ }^{3} \mathrm{~J}_{\mathrm{PH}}=24.1 \mathrm{~Hz}, 1 \mathrm{H}\right), 6.40\left(\mathrm{~d},{ }^{3}{ }^{3} \mathrm{H}\right.$ ) $=13.6$ $\mathrm{Hz}, 1 \mathrm{H}), 4.04\left(\mathrm{q},{ }^{3} \mathrm{~J} \mathrm{H}=7.2 \mathrm{~Hz}, 2 \mathrm{H}\right), 1.17\left(\mathrm{t},{ }^{3} \mathrm{~J} \mathrm{~h}=7.2 \mathrm{~Hz}\right.$, 3H); ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 166.3,139.5,135.0-128.0$ $(\mathrm{m}), 118.5\left(\mathrm{~d},{ }^{1}{ }_{\mathrm{PC}}=100 \mathrm{~Hz}\right), 105.1\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{PC}}=11.1 \mathrm{~Hz}\right), 59.1$, 13.5; ${ }^{31} \mathrm{P}$ NMR $\left(\mathrm{CDCl}_{3}, 120 \mathrm{MHz}\right) \delta 37.99$.

General Procedure for the Preparation of Dihydropyridines 5. Aldehyde 3 ( 1.5 mmol ) was added to a $0-10{ }^{\circ} \mathrm{C}$ sol ution of phosphonium salt $\mathbf{2}(1.234 \mathrm{~g}, 3 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (8 mL ) under $\mathrm{N}_{2}$, and the mixture was stirred and warmed at 40 ${ }^{\circ} \mathrm{C}$ until TLC indicated the disappearance of aldehyde 3. Evaporation of solvent under reduced pressure afforded an oil that was chromatographed on silica gel to give the compounds 5.

Diethyl 4-(3-Pyridyl)-1,4-dihydro-3,5-pyridinedicarboxylate (5aa). The general procedure was followed using phosphonium salt 2a and $0.142 \mathrm{~mL}(1.5 \mathrm{mmol})$ of 3-pyridinecarboxaldehyde ( 24 h ). Evaporation of solvent under reduced pressure afforded a oil which was chromatographed on silica gel ( $1 / 2$ hexane/AcOEt) to give $0.236 \mathrm{~g}(52 \%)$ of 5 aa as a yellow oil ( $\mathrm{R}_{\mathrm{f}}=0.21 \mathrm{in}$ AcOEt): ${ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.53$ $\left(\mathrm{d},{ }^{3}{ }^{3}{ }_{\text {н }}=8.7 \mathrm{~Hz}, 1 \mathrm{H}\right), 8.35\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}}=4.8 \mathrm{~Hz}, 1 \mathrm{H}\right), 7.68(\mathrm{~d}$, 3) $\mathrm{HH}=10.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.44(\mathrm{~s}, 1 \mathrm{H}), 7.37\left(\mathrm{~d},{ }^{3} \mathrm{~J} \mathrm{HH}=5.1 \mathrm{~Hz}, 2 \mathrm{H}\right)$, 7.20-7.16 (m, 1H ), 4.91 (s, 1H), 4.10-4.00 (m, 4H ), 1.19-1.14 (m, 6H); ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 166.7,149.7,147.3,142.5$, 136.1, 134.2, 123.1, 107.5, 60.2, 35.7, 14.2; IR (film) 3216, 3153, 3088, 2982, 2937, 1697, 1497, 1289, 1176; M/S (EI) m/z 302 (M ${ }^{+}, 8$ ). Anal. Calcd for $\mathrm{C}_{16} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{4}$ : C, 63.56; H, 6.00; N, 9.27. Found: C, 63.89; H, 6.05; N, 9.29.

[^6]General Procedure A for the Preparation of 2-Azadienes 7. Aldehyde 3 ( 4 mmol ) was added to a $0-10{ }^{\circ} \mathrm{C}$ solution of phosphazene $\mathbf{6}(4 \mathrm{mmol})$ in $\mathrm{CHCl}_{3}(15 \mathrm{~mL})$ under $\mathrm{N}_{2}$, and the mixture was stirred at room temperature or warmed at $45^{\circ} \mathrm{C}$ or $60^{\circ} \mathrm{C}$ until TLC indi cated the disappearance of phosphazene.

General Procedure B for the Preparation of 2-Azadienes 7. Aldehyde $\mathbf{3}$ ( 4 mmol ) was added to phosphazene 1 ( 4 mmol ) under $\mathrm{N}_{2}$, and the mixture was warmed at $100^{\circ} \mathrm{C}$ until TLC indicated the disappearance of phosphazene.

4-(Ethoxycarbonyl)-1-(4-nitrophenyl)-3-phenyl-2-aza-buta-1,3-diene (7ca). The general procedure A was fol lowed using phosphazene $\mathbf{6 c}(1.558 \mathrm{~g}, 4 \mathrm{mmol})$ and 0.604 g ( 4 mmol ) of p-nitrobenzaldehyde (room temperature/2 h). E vaporation of sol vent under reduced pressure afforded an oil which was chromatographed on silica gel ( $1 / 10$ AcOEt/hexane) to give 0.92 g (71\%) of 7ca as a brown oil. F ollowing the general procedure B $1.806 \mathrm{~g}(4 \mathrm{mmol})$ of phosphazene $\mathbf{1 c}$ and $0.604 \mathrm{~g}(4 \mathrm{mmol})$ of p-nitrobenzal dehyde were used for 3 h , and the crude oil was chromatographed on silica gel ( $1 / 10$ AcOEt/hexane) to give $0.674 \mathrm{~g}(52 \%)$ of 7 ca as a brown oil ( $\mathrm{R}_{\mathrm{f}}=0.52$, AcOEt): ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.29(\mathrm{~s}, 1 \mathrm{H}), 8.23\left(\mathrm{~d},{ }^{3}{ }^{3}\right.$ нн $=8.7 \mathrm{~Hz}$, $2 \mathrm{H}), 8.02\left(\mathrm{~d},{ }^{3}{ }^{3}\right.$ нн $\left.=8.7 \mathrm{~Hz}, 2 \mathrm{H}\right), 7.55-7.28(\mathrm{~m}, 5 \mathrm{H}), 5.76(\mathrm{~s}$, $1 \mathrm{H}), 4.02\left(\mathrm{q},{ }^{3} \mathrm{~J} \mathrm{H}=7.2 \mathrm{~Hz}, 2 \mathrm{H}\right), 1.27\left(\mathrm{t},{ }^{3} \mathrm{~J}_{\mathrm{H}}=7.2 \mathrm{~Hz}, 3 \mathrm{H}\right)$. Anal. Calcd for $\mathrm{C}_{18} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{4}: \mathrm{C}, 66.66 ; \mathrm{H}, 4.97 ; \mathrm{N}, 8.64$. Found: C, 66.99; H, 4.91; N, 8.67.

General Procedure A for the Preparation of Dihydropyridines 9. Aldehyde $3(3 \mathrm{mmol})$ was added to a $0-10{ }^{\circ} \mathrm{C}$ solution of phosphazene ( 6 mmol ) in $\mathrm{CHCl}_{3}(8 \mathrm{~mL})$ under $\mathrm{N}_{2}$, and the mixture was stirred at $60^{\circ} \mathrm{C}$ until TLC indicated the disappearance of phosphazene. Evaporation of solvent under reduced pressure afforded an oil that was chromatographed on silica gel to give the commpounds 9 .

Dimethyl 4,6-Dimethyl-2-(4-nitrophenyl)-1,2-dihydro-3,5-pyridinedicarboxylate (9ba). The general procedure A was followed using phosphazene $\mathbf{6 b}(1.88 \mathrm{~g}, 6 \mathrm{mmol})$ and 0.453 g ( 3 mmol ) of p-nitrobenzal dehyde for 72 h . The crude oil was chromatographed on silica gel ( $5 / 1$ hexane/AcOEt) to give 0.455 $\mathrm{g}(44 \%)$ of 9 ba as an orange oil ( $\mathrm{R}_{\mathrm{f}}=0.25$, AcOEt): ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.04$ (d, 敃 нн $=8.7 \mathrm{~Hz}, 2 \mathrm{H}$ ), 7.36 (d, 3 нн $=8.7 \mathrm{~Hz}, 2 \mathrm{H}), 5.99(\mathrm{~s}, 1 \mathrm{H}), 5.64\left(\mathrm{~d},{ }^{3} \mathrm{~J} \mathrm{H}=4.5 \mathrm{~Hz}, 1 \mathrm{H}\right), 3.63$ (s, 3H), $3.62(\mathrm{~s}, 3 \mathrm{H}), 2.32(\mathrm{~s}, 3 \mathrm{H}), 2.19(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (75 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 167.9,166.9,154.7,149.7,147.7,145.2,127.0$, 123.8, 108.5, 104.3, 53.9, 51.3, 50.8, 20.9, 19.3; IR (film) 3326, 3081, 2952, 2930, 2853, 1696, 1595, 1518, 1345, 1214; M/S (EI) $\mathrm{m} / \mathrm{z} 346\left(\mathrm{M}^{+}, 3\right)$. Anal. Calcd for $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{6}$ : C, 59.93; H, 5.24; N, 8.12. Found: C, 59.00; H, 5.29; N, 8.10.

General Procedure $\mathbf{B}$ for the Preparation of Dihydropyridines 9. Aldehyde $\mathbf{3}(3 \mathrm{mmol})$ was added to phosphazene ( 6 mmol ) under $\mathrm{N}_{2}$, and the mixture was warmed at $100^{\circ} \mathrm{C}$ until TLC indicated the disappearance of phosphazene. Evaporation of solvent under reduced pressure afforded an oil that was chromatographed on silica gel to give the commpounds 9 .

General Procedure C for the Preparation of Dihydropyridines 9. Phosphazene $6(3 \mathrm{mmol})$ was added to a $0-10$ ${ }^{\circ} \mathrm{C}$ solution of 2-azadiene $7(3 \mathrm{mmol})$ in $\mathrm{CHCl}_{3}(10 \mathrm{~mL})$ under $\mathrm{N}_{2}$, and the mixture was warmed to $60^{\circ} \mathrm{C}$ until TLC indicated the disappearance of phosphazene. Evaporation of solvent under reduced pressure afforded an oil that was chromatographed on silica gel to give the commpounds 9.

General Procedure D for the Preparation of Dihydropyridines 9 and 11 . To a solution of 2-azadiene 7 ( 3 mmol ) in $\mathrm{CHCl}_{3}$ or toluene ( 10 mL ) was added enamine $\mathbf{1 0}$ ( 3 mmol ), and the mixture was stirred to adequate temperature until TLC indicated the disappearance of phosphazene. Evaporation of solvent under reduced pressure afforded an oil that was chromatographed on silica gel to give the commpounds 9 or 11.

Diethyl 2-(4-Nitrophenyl)-1,2-dihydro-3,5-pyridinedicarboxylate (9af). The general procedure $C$ was followed using azadiene 7aa ( $0.74 \mathrm{~g}, 3 \mathrm{mmol}$ ) and $0.939 \mathrm{~g}(3 \mathrm{mmol})$ of phosphazene $6 \mathbf{a}$ for 4 h . The crude oil was chromatographed on silica gel ( $5 / 1$ hexane/AcOEt) to give 0.41 g (39\%) of 9af as an orange oil. Following the general procedure D azadiene 7aa $(0.74 \mathrm{~g}, 3 \mathrm{mmol})$ and $0.51 \mathrm{~g}(3 \mathrm{mmol})$ of ethyl trans-2-
pyrrolydineacrylate in $\mathrm{CHCl}_{3}$ were used (room temperature) 112 h ), and the crude oil was chromatographed on silica gel ( $5 / 1$ hexane/AcOEt) to give $0.578 \mathrm{~g}(55 \%)$ of 9af as an orange oil ( $\mathrm{R}_{\mathrm{f}}=0.54$ in AcOEt): ${ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.07$ $\left(\mathrm{d},{ }^{3} \mathrm{~J}_{\mathrm{H}}=8.7 \mathrm{~Hz}, 2 \mathrm{H}\right), 7.68(\mathrm{~s}, 1 \mathrm{H}), 7.67(\mathrm{~s}, 1 \mathrm{H}), 7.51\left(\mathrm{~d},{ }^{3} \mathrm{~J}\right.$ нн $=8.7 \mathrm{~Hz}, 2 \mathrm{H}), 6.80\left(\mathrm{~d},{ }^{3} \mathrm{~J} \mathrm{H}=3.0 \mathrm{~Hz}, 1 \mathrm{H}\right), 5.74\left(\mathrm{~d},{ }^{3} \mathrm{~J} \mathrm{H}=2.4\right.$ $\mathrm{Hz}, 1 \mathrm{H}), 4.16-4.00(\mathrm{~m}, 4 \mathrm{H}), 1.26-1.15(\mathrm{~m}, 6 \mathrm{H})$; ${ }^{13} \mathrm{C}$ NMR (75 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 165.8,165.6,149.7,147.4,146.8,133.4,127.6$, 123.9, 111.7, 97.5, 60.5, 59.9, 54.5, 14.4, 14.1; IR (film) 3302, 3075, 2982, 2928, 2850, 1677, 1620, 1524, 1347, 1223; M/S (EI) $\mathrm{m} / \mathrm{z} 346\left(\mathrm{M}^{+}, 2\right)$. Anal. Calcd for $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{6}$ : $\mathrm{C}, 58.96 ; \mathrm{H}, 5.24$; N, 8.09. Found: C, 59.00; H, 5.27; N, 8.10.

General Procedure for the Preparation of Benzo[h]-[1,6]naphthyridin-5-one 13. A mixture of pyridine $\mathbf{1 2}$ (1.5 mmol ), acetone ( 10 mL ), acetic acid ( 1 mL ), water ( 1 mL ), and powdered iron $(0.36 \mathrm{~g})$ was refluxed for 5 h , and then dichloromethane ( 10 mL ) was added. The resultant suspension was filtered, and a saturated solution of sodium carbonate ( 5 mL ) was added to the filtrate. The organic layer was separated and dried over anhydrous magnesium sulfate. The solvent was removed under reduced pressure, and the crude product was recrystallized from acetonitrile to give 13.

3-(E thoxycarbonyl)-benzo[h][1,6]naphthyridin-5one (13a). It was prepared according to the general procedure using pyridine $12 \mathrm{ac}(0.494 \mathrm{~g})$ to give $0.285 \mathrm{~g}(71 \%)$ of $\mathbf{1 3 a}$ as a white solid: $\mathrm{mp} 291-292^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , DMSO$\left.\mathrm{d}_{6}\right) \delta 12.04(\mathrm{~s}, 1 \mathrm{H}), 9.45(\mathrm{~s}, 1 \mathrm{H}), 8.98(\mathrm{~s}, 1 \mathrm{H}), 8.63\left(\mathrm{~d},{ }^{3} \mathrm{JH}=\right.$ $7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.66\left(\mathrm{t},{ }^{3} \mathrm{~J}\right.$ нн $\left.=7.5 \mathrm{~Hz}, 1 \mathrm{H}\right), 7.41\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}}=8.1\right.$ $\mathrm{Hz}, 1 \mathrm{H}), 7.34\left(\mathrm{t},{ }^{3} \mathrm{~J}\right.$ нн $\left.=7.5 \mathrm{~Hz}, 1 \mathrm{H}\right), 4.41\left(\mathrm{q}^{3} \mathrm{~J}_{\mathrm{H}}=7.0 \mathrm{~Hz}\right.$, 2 H ), 1.38 ( t , ${ }^{3} \mathrm{~J}$ нн $=7.0 \mathrm{~Hz}, 3 \mathrm{H}$ ); ${ }^{13} \mathrm{C}$ NMR ( 75 MHz , DMSO$\mathrm{d}_{6}$ ) $\delta 164.0,160.4,153.7,153.5,138.8,136.7,132.5,124.8$, 124.7, 122.8, 120.7, 118.2, 116.2, 61.5, 14.1; IR (KBr) 3433, 3177, 3033, 2962, 2905, 1708, 1666, 1275, 1250; M/S (EI) m/z 268 ( $\mathrm{M}^{+}, 100$ ). Anal. Calcd for $\mathrm{C}_{15} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{3}$ : $\mathrm{C}, 67.05$; $\mathrm{H}, 4.50$; N, 10.42. Found: C, 67.11; H, 4.55; N, 10.40.

General Procedure for [4+2] Cycloaddition Reaction of 2-Azadienes 7 with Cyclic E namines 14. Cyclic enamine ( 4 mmol ) was added to a $0-10{ }^{\circ} \mathrm{C}$ solution of 2 -azadiene 7 (4 mmol) in $\mathrm{CHCl}_{3}(15 \mathrm{~mL})$ under $\mathrm{N}_{2}$, and the mixture was stirred at room temperature until TLC indicated the disappearance of 2-azadiene. Evaporation of solvent under reduced pressure afforded an oil that was chromatographed on silica gel to give the compounds 15,16 , or 17.

Ethyl 1,2,6,7,8,8a-Hexahydro-1-(4-nitrophenyl)-4-isoquinolinecarboxylate (15aa). The general procedure was following using azadiene 7aa ( $0.992 \mathrm{~g}, 4 \mathrm{mmol}$ ) and 1-pyrro-lidine-1-cycl ohexene $\mathbf{1 4 a}(0.605 \mathrm{~g}, 4 \mathrm{mmol})$ for 1 h . The crude oil was chromatographed on silica gel (10/1 hexane/AcOEt) to give 1.25 g (95\%) of 15aa as an orange solid: $\mathrm{mp} 110-111{ }^{\circ} \mathrm{C}$ (recrystallized from $\mathrm{Et}_{2} \mathrm{O} /$ hexane); ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $\delta 8.25\left(\mathrm{~d},{ }^{3}{ }^{3} \mathrm{Hн}=8.7 \mathrm{~Hz}, 2 \mathrm{H}\right), 7.59\left(\mathrm{~d},{ }^{3}{ }^{\mathrm{J}} \mathrm{H}=6.3 \mathrm{~Hz}, 1 \mathrm{H}\right), 7.51$ $\left(\mathrm{d},{ }^{3} \mathrm{~J} \boldsymbol{\mu}=8.7 \mathrm{~Hz}, 2 \mathrm{H}\right), 6.62\left(\mathrm{~d},{ }^{3} \mathrm{~J} \boldsymbol{\mu}=1.8 \mathrm{~Hz}, 1 \mathrm{H}\right), 4.61(\mathrm{~d}$, $\left.{ }^{3} \mathrm{~J} \mathrm{HH}=6.3 \mathrm{~Hz}, 1 \mathrm{H}\right), 4.26-4.15(\mathrm{~m}, 2 \mathrm{H}), 4.05\left(\mathrm{~d},{ }^{3} \mathrm{~J} \mathrm{HH}=10.8\right.$ $\mathrm{Hz}, 1 \mathrm{H}), 2.54-1.42(\mathrm{~m}, 6 \mathrm{H}), 1.30\left(\mathrm{t},{ }^{3} \mathrm{~J} \mathrm{H}=7.2 \mathrm{~Hz}, 3 \mathrm{H}\right), 1.09-$ $1.01(\mathrm{~m}, 1 \mathrm{H})$; ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 167.1,148.0,147.9$, 142.0, 128.7, 127.6, 124.0, 121.6, 98.5, 62.1, 59.3, 40.2, 26.7, 25.9, 21.6, 14.5; IR (KBr) 3283, 2931, 2866, 1655, 1592, 1519, 1342; M/S (EI) m/z 328 (M+, 24). Anal. Calcd for $\mathrm{C}_{18} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{4}$ : C, 65.84; H, 6.14; N, 8.53. Found: C, 65.65; H, 6.18; N, 8.50.

Methyl 3-Methyl-1-(4-nitrophenyl)-5,6,7,8-tetrahydro-4-isoquinolinecarboxylate (16bc). The general procedure was following using azadiene 7ba ( $0.996 \mathrm{~g}, 4 \mathrm{mmol}$ ) and 1-pyrrol idine-1-cycl ohexene 14 a ( $0.605 \mathrm{~g}, 4 \mathrm{mmol}$ ) for 14 h . The crude oil was chromatographed on silica gel (10/1 hexane/ AcOEt) to give 0.996 g ( $76 \%$ ) of 16bc as an orange solid: mp $114-115{ }^{\circ} \mathrm{C}$ (recrystallized from AcOEt/hexane); ${ }^{1 \mathrm{H}}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.30\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}}=8.7 \mathrm{~Hz}, 2 \mathrm{H}\right), 7.63\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}}=8.7\right.$ $\mathrm{Hz}, 2 \mathrm{H}), 3.97(\mathrm{~s}, 3 \mathrm{H}), 2.80\left(\mathrm{t},{ }^{3} \mathrm{~J} н \mathrm{H}=6.3 \mathrm{~Hz}, 2 \mathrm{H}\right), 2.60\left(\mathrm{t},{ }^{3} \mathrm{~J}\right.$ нн $=6.3 \mathrm{~Hz}, 2 \mathrm{H}), 2.52(\mathrm{~s}, 3 \mathrm{H}), 1.84-1.78(\mathrm{~m}, 2 \mathrm{H}), 1.73-1.70(\mathrm{~m}$, 2 H ); ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 169.2,156.5,151.3$ 147.0, 146.7, 144.6, 129.9, 128.8, 128.1, 123.4, 52.4, 27.4, 26.8, 22.4, 22.3, 21.7; IR (KBr) 3433, 3077, 2923, 2854, 1727, 1521, 1348, 1255; M/S (EI) m/z 326 (M ${ }^{+}, 41$ ). Anal. Calcd for $\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{4}$ : C, 66.25; H, 5.56; N, 8.58. Found: C, 66.11; H, 5.60; N, 8.59.

Ethyl 6-(4-Nitrophenyl)-4,5-(1-propanyl-3-yliden)-1,4,5,6-tetrahydro-3-pyridinecarboxylate (17aa). The general procedure was following using azadi ene 7aa ( $0.992 \mathrm{~g}, 4 \mathrm{mmol}$ ) and 1-pyrrolidine-1-cyclopentene 14b ( $0.496 \mathrm{~g}, 4 \mathrm{mmol}$ ) for 1 h. The crude oil was chromatographed on silica gel (10/1 hexane/AcOEt) to give 1.232 g (98\%) of 17aa as a yellow solid: $\mathrm{mp} 118-119^{\circ} \mathrm{C}$ (recrystallized from AcOEt/hexane); ${ }^{1 \mathrm{H}}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.24\left(\mathrm{~d},{ }^{3}{ }^{3}\right.$ нн $\left.=8.7 \mathrm{~Hz}, 2 \mathrm{H}\right), 7.59(\mathrm{~d}$, $\left.{ }^{3} \mathrm{~J}_{\mathrm{H}}=6.6 \mathrm{~Hz}, 1 \mathrm{H}\right), 7.50\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{hн}}=8.7 \mathrm{~Hz}, 2 \mathrm{H}\right), 6.12\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}}\right.$ $=2.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.76\left(\mathrm{~d},{ }^{3} \mathrm{~J} \mathrm{H}=6.6 \mathrm{~Hz}, 1 \mathrm{H}\right), 4.24-4.19(\mathrm{~m}, 2 \mathrm{H})$, $4.08\left(\mathrm{~d},{ }^{3}{ }_{\mathrm{H}} \mathrm{H}=9.9 \mathrm{~Hz}, 1 \mathrm{H}\right), 2.87-2.84(\mathrm{~m}, 1 \mathrm{H}), 2.42-2.40(\mathrm{~m}$, $2 \mathrm{H}), 1.79-1.70(\mathrm{~m}, 1 \mathrm{H}), 1.44-1.21(\mathrm{~m}, 4 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 75 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 167.1,147.9,147.7,143.6,133.1,128.0,124.1,121.8$, 98.5, 63.0, 59.4, 50.7, 31.5, 28.3, 14.5; IR (KBr) 3296, 3070, 2975, 2929, 2848, 1657, 1578, 1514, 1346, 1232; M/S (EI) m/z 314 (M ${ }^{+}, 2$ ). Anal. Calcd for $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{4}: \mathrm{C}, 64.96 ; \mathrm{H}, 5.77 ; \mathrm{N}$, 8.91. Found: C, 64.75; H, 5.80; N, 8.86 .

General Procedure for Aromatization of Compounds 15 and 17. To a solution of bicyclic compound ( 2 mmol ) in dioxane ( 5 mL ) was added $0.212 \mathrm{~g}(2 \mathrm{mmol})$ of $p$-benzoquinone, and the mixture was stirred at $100^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$. The solvent was evaporated under reduced pressure, and the resulting oil was purified by silica gel column chromatography.

Ethyl 6-(4-Nitrophenyl)-4,5-trimethylene-3-pyridinecarboxylate (18aa). The general procedure was following using 0.63 g ( 2 mmol ) of compound 17aa for 12 h . The crude oil was chromatographed on silica gel ( $10 / 1$ hexane/AcOEt) to give $0.58 \mathrm{~g}(93 \%)$ of 18aa as a brown solid: $\mathrm{mp} 110-111{ }^{\circ} \mathrm{C}$ (recrystallized from AcOEt/hexane); ${ }^{1} \mathrm{H}$ NMR $(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 9.08(\mathrm{~s}, 1 \mathrm{H}), 8.31\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{н}}=9.0 \mathrm{~Hz}, 2 \mathrm{H}\right), 7.59(\mathrm{~d}$, ${ }^{3} \mathrm{~J}$ нн $\left.=9.0 \mathrm{~Hz}, 2 \mathrm{H}\right), 4.40\left(\mathrm{q},{ }^{3} \mathrm{JH}=7.2 \mathrm{~Hz}, 2 \mathrm{H}\right), 3.36\left(\mathrm{t},{ }^{3} \mathrm{~J}\right.$ нн $=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 3.11\left(\mathrm{t},{ }^{3} \mathrm{~J}\right.$ нн $\left.=7.5 \mathrm{~Hz}, 2 \mathrm{H}\right), 2.15-2.13(\mathrm{~m}, 2 \mathrm{H})$, $1.41\left(\mathrm{t},{ }^{3} \mathrm{~J}\right.$ нн $\left.=7.2 \mathrm{~Hz}, 3 \mathrm{H}\right)$; ${ }^{13} \mathrm{C} \mathrm{NMR} \mathrm{( } 75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 165.6$, 158.0, 154.3, 149.5, 145.5, 138.9, 129.6, 123.5, 122.5, 61.2, 33.9, 32.5, 25.2, 14.3; IR (KBr) 3423, 2980, 2925, 2851, 1706, 1516, 1346, 1281; $M / \mathrm{S}$ (EI) $\mathrm{m} / \mathrm{z} 312$ ( $\mathrm{M}^{+}, 100$ ). Anal. Calcd for $\mathrm{C}_{17} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{4}$ : C, 65.37; H, 5.16; $\mathrm{N}, 8.97$. Found: C, 65.29; H, 5.14; N, 8.98.

1,1-Diphenyl-1-methyl-3,4-(tetramethylen-4-one)-2-aza1 $\lambda^{5}$-phosphabuta-1,3-diene (19a). A solution of 0.686 g (5 mmol ) of 3 -azidocyclohex-2-enone ${ }^{21}$ in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (3 mL ) was added dropwise to a $0-10^{\circ} \mathrm{C}$ solution of $1.001 \mathrm{~g}(5$ mmol ) of methyldi phenyl phospine in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}(8 \mathrm{~mL})$ under $\mathrm{N}_{2}$, and the mixture was stirred for 30 min at room temperature. The reaction product is unstable to distillation or chromatography and therefore was not isolated and used for the following reactions: ${ }^{1} \mathrm{H} \mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ of crude reaction mixture ( $\mathbf{1 9 a}+\mathrm{Ph}_{2} \mathrm{CH}_{3} \mathrm{PO}$ ) $\delta 7.66-7.40(\mathrm{~m}$, $10 \mathrm{H}), 4.87(\mathrm{~s}, 1 \mathrm{H}), 2.45\left(\mathrm{t},{ }^{3} \mathrm{~J}\right.$ нн $\left.=6.0 \mathrm{~Hz}, 2 \mathrm{H}\right), 2.21-2.16(\mathrm{~m}$, $2 \mathrm{H}), 2.09\left(\mathrm{~d},{ }^{2} \mathrm{~J}_{\mathrm{PH}}=13.0 \mathrm{~Hz}, 3 \mathrm{H}\right), 1.90-1.88(\mathrm{~m}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 198.0,176.0\left(\mathrm{~d},{ }^{2} \mathrm{~J} \mathrm{pc}=6.3 \mathrm{~Hz}\right), 132.4-128.1$ $\left.(\mathrm{m}), 108.5\left(\mathrm{~d},{ }^{3}\right)_{\mathrm{PC}}=15.5 \mathrm{~Hz}\right), 36.3,35.7\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{PC}}=24.7 \mathrm{~Hz}\right)$, 22.2, $13.3\left(\mathrm{~d},{ }^{1} \mathrm{~J} \mathrm{pC}=67.9 \mathrm{~Hz}\right) ;{ }^{31} \mathrm{P}$ NMR $\left(\mathrm{CDCl}_{3}, 120 \mathrm{MHz}\right) \delta$ 5.91.

1-(4-Nitrophenyl)-3,4-(tetramethylen-4-one)-2-azabuta-1,3-diene (20). p-Nitrobenzaldehyde ( $0.604 \mathrm{~g}, 4 \mathrm{mmol}$ ) was added to a $0-10^{\circ} \mathrm{C}$ solution of phosphazene $19 \mathrm{a}(4 \mathrm{mmol})$ in $\mathrm{CHCl}_{3}$ ( 15 mL ) under $\mathrm{N}_{2}$, and the mixture was stirred at 45 ${ }^{\circ} \mathrm{C}$ until TLC indi cated the disappearance of phosphazene. The reaction product is unstable to distillation or chomatography and therefore was not isolated and used for the following reactions: ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of crude reaction mixture ( $\mathbf{2 0}+\mathrm{Ph}_{2} \mathrm{CH}_{3} \mathrm{PO}$ ) $\delta 8.23\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\text {нн }}=8.7 \mathrm{~Hz}, 2 \mathrm{H}\right), 7.96$ $(\mathrm{s}, 1 \mathrm{H}), 7.94\left(\mathrm{~d},{ }^{3} \mathrm{~J}\right.$ нн $\left.=8.7 \mathrm{~Hz}, 2 \mathrm{H}\right), 7.61-7.30(\mathrm{~m}, 10 \mathrm{H}), 5.53$ ( $\mathrm{s}, 1 \mathrm{H}$ ), $2.53\left(\mathrm{t}\right.$, ³ $\left._{\mathrm{H}}=6.1 \mathrm{~Hz}, 2 \mathrm{H}\right), 2.36\left(\mathrm{t}\right.$, ${ }^{3} \mathrm{~J}$ нн $=6.6 \mathrm{~Hz}$, $2 \mathrm{H}), 1.98-2.06(\mathrm{~m}, 2 \mathrm{H}), 1.83\left(\mathrm{~d},{ }^{2} \mathrm{~J} \mathrm{PH}=13.0 \mathrm{~Hz}, 3 \mathrm{H}\right) ;{ }^{13} \mathrm{C} \mathrm{NMR}$ $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 199.6,170.8,155.9,150.9,139.9,134.3-$ $122.9(\mathrm{~m}), 113.0,36.8,28.4,21.7,16.1\left(\mathrm{~d},{ }^{1} \mathrm{~J} \mathrm{pc}=74.0 \mathrm{~Hz}\right)$.

6-(4-Nitrophenyl)-2,3,4,6,7,8,9-heptahydrophenanthri-din-1(5H)-one (21). 1-Pyrrolidine-1-cyclohexene 14a (0.605 $\mathrm{g}, 4 \mathrm{mmol}$ ) was added to a $0-10^{\circ} \mathrm{C}$ solution of 2-azadiene 20 ( 4 mmol ) in $\mathrm{CHCl}_{3}(15 \mathrm{~mL})$ under $\mathrm{N}_{2}$, and the mixture was stirred at room temperature for 17 h . Evaporation of solvent under reduced pressure afforded an oil that was chromatographed on silica gel ( $1 / 2$ hexane/AcOE t) to give 0.675 g (52\%)
of 21 as an orange solid: mp 109-110 ${ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 8.18\left(\mathrm{~d},{ }^{3} \mathrm{~J} \boldsymbol{\text { нн }}=8.4 \mathrm{~Hz}, 2 \mathrm{H}\right), 7.45\left(\mathrm{~d},{ }^{3} \mathrm{~J} \boldsymbol{\mu н}=8.4 \mathrm{~Hz}\right.$, $2 \mathrm{H}), 6.97\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}}=2.4 \mathrm{~Hz}, 1 \mathrm{H}\right), 4.71(\mathrm{~s}, 1 \mathrm{H}), 4.03\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}}=\right.$ $10.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.56-0.77(\mathrm{~m}, 13 \mathrm{H})$; ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 194.5,157.9,148.0,147.8,128.7,126.9,124.0,123.6,106.4$, $62.4,39.9,38.7,30.0,29.7,26.9,26.0,21.2$; IR (film) 3350, 3215, 2926, 2858, 1513, 1345; M/S (EI) m/z 324 (M+, 2). Anal. Calcd for $\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{3}$ : C, 70.36; $\mathrm{H}, 6.22 ; \mathrm{N}, 8.64$. Found: C, 70.56; H, 6.20; N, 8.65.
