# Diels-Alder Reactions of N-Acyl-2-alkyl(aryl)-5-vinyl-2,3-dihydro-4-pyridones 

Daniel L. Comins,* Jeffrey T. Kuethe,*,† Teresa M. Miller, Florence C. Février, and Clinton A. Brooks<br>Department of Chemistry, North Carolina State University, Raleigh, North Carolina 27695-8204<br>daniel_comins@ncsu.edu

Received March 18, 2005

Readily available $N$-acyl-5-vinyl-2,3-dihydro-4-pyridones undergo Diels-Alder cyclization with various dienophiles to afford novel octahydroquinolines containing synthetically useful functionality. With dihydropyridone 5 and cis-disubstituted dienophiles, the resulting cycloadducts were obtained as single diastereomers in good to excellent yield. The corresponding reaction of 5 with methyl acrylate, acrylonitrile, and phenyl vinyl sulfone showed modest preference for the endo adducts. The effect of the dihydropyridone C-2 and C-4 substituents on the degree of diastereofacial control was examined. By using this methodology, the core decahydroquinoline skeleton of gephyrotoxin was prepared in a stereocontrolled fashion. Interesting reactivity was observed with certain dienophiles leading to ring-opening of the initially formed cycloadducts. This tandem reaction provides a route to uniquely substituted $\beta$-aminoketones, alcohols, and unnatural amino acids.

## Introduction

The Diels-Alder reaction provides an efficient and rapid means of constructing highly functionalized sixmembered heterocyclic ring systems with excellent control of the regio-, diastereo-, and enantioselectivity. ${ }^{1}$ The heteroatom-assisted Diels-Alder reaction has emerged as an extremely powerful method for the preparation of complex heterocycles. In particular, the increased reactivity of amino-substituted dienes allows for the facile preparation of functional arrays which would otherwise be difficult to obtain. ${ }^{2}$ Bimolecular and intramolecular Diels-Alder reactions of 1- N -acylamino-1,3-dienes ${ }^{3}$ and $N, N$-dialkylamino-1,3-dienes ${ }^{3 g, 4}$ have been well-studied and typically proceed with a high degree of regioselectivity and facial selectivity. In addition, the Diels-Alder

[^0]reactions of 2 - N -acylamino-1,3-dienes ${ }^{5}$ and N -tosylamino1,3 -dienes ${ }^{6}$ have been reported. Due to this success, it is not surprising that heteroatom-assisted Diels-Alder reactions continue to see a number of advances and synthetic applications in target oriented synthesis.

The deca-, octa-, and hexahydroquinoline ring systems are present as a key structural feature in several major classes of alkaloids (Figure 1). Representative members include, but are not limited to, gephyrotoxin and lycopo-

depending upon the type and degree of substitution and relative ring fusion. The ability to construct both multiple functional arrays and subsequently the ring systems found in these and other natural and unnatural products with complete control of both regio- and stereocontrol is effectively useful in synthesis. As part of a program to develop and expand the synthetic versatility of $N$-acyl2,3 -dihydro-4-pyridones for alkaloid synthesis, ${ }^{12}$ we recently reported the Diels-Alder reactions of substituted $N$-acyl-5-vinyl-2,3-dihydro-4-pyridones of type $\mathbf{1}$ with various dienophiles as an effective method for the construction of novel octahydroquinoline derivatives of general type 2. ${ }^{13}$ In addition, we also reported interesting reactivity of diene 1 with certain dienophiles leading to ring-opening of the initially formed cycloadduct 2 giving rise to $\beta$-amino ketones, alcohols, and amino acids of type 3. ${ }^{14}$ Herein we present a complete account of these investigations.

## Results and Discussion

Preparation of Octahydroquinolines. Our initial study began with the preparation of $N$-acyl-2-phenyl-5-vinyl-2,3-dihydro-4-pyridone (5; Scheme 2). Iodination of readily available 2,3 -dihydropyridone (4) with NIS/cat. [hydroxyl(tosyloxy)iodo]benzene (HTIB) followed by Stille coupling with vinyltributyltin afforded the desired Diels-

Alder precursor 5 in good overall yield. ${ }^{15}$ The Diels-Alder reaction of 5 with $N$-phenylmaleimide in refluxing toluene gave cycloadduct 6 as a single diastereomer in $96 \%$ isolated yield. The relative stereochemistry of $\mathbf{6}$ was unequivocally established by single-crystal X-ray analysis, which showed the exclusive preference for endo approach of the dienophile. ${ }^{13}$ Since the C-2 phenyl group of diene 5 occupies a pseudoaxial orientation, ${ }^{16}$ excellent diastereofacial control was observed due to addition of the dienophile exclusively anti to the phenyl substituent, thus setting the three new contiguous chiral centers with complete stereocontrol. The Diels-Alder reactions of 5 with various dienophiles are summarized in Table 1. When cis-disubstituted dienophiles were employed (entries $1-6$ ), the corresponding cycloadducts were obtained as single diastereomers in good to excellent yield. The structures were determined by ${ }^{1} \mathrm{H}$ NMR analysis by comparison of coupling constants with those observed for cycloadduct 6. On the other hand, when dimethyl fumarate served as the dienophile (entry 7), no endo/exo selectivity was observed and cycloadducts 13a and 13b were obtained as a $1: 1$ mixture of diastereomers. Interestingly, reaction of 5 with methyl acrylate, acrylonitrile, and phenyl vinyl sulfone (entries 8-10) only showed modest preference for the endo adducts. In contrast, the Diels-Alder reaction of 5 and acryloyl chloride (entry 11) proceeded at room temperature to afford the labile adduct 17 as one diastereomer. Treatment of the crude product with anhydrous methanol provided the methyl ester 14a in moderate yield. In each case the products were in full accord with that predicted by HOMO diene-LUMO dienophile interactions. In addition, in all cases there was no detectable amount of double bond isomerization of the cycloadducts. ${ }^{5 a}$

Having established that the presence of a C-2 phenyl group provided excellent diastereofacial control, we next probed the diastereoselectivity of the reaction by varying the C-2 substituent (Scheme 3). While the C-2 phenyl group exerted a significant steric influence causing the dienophile to approach exclusively anti, unbranched alkyl substitutents resulted in erosion of diastereoselectivity. For example, reaction of diene $\mathbf{1 8}^{15}$ with $N$-phenylmaleimide under the identical reaction conditions as described for diene 5 provided a $95 \%$ combined yield of a 7:1 mixture of diastereomers (19:20) which were easily separated by chromatography. In like fashion, reaction of diene 21 with either $N$-phenylmaleimide or benzodithiin tetraoxide ${ }^{17}$ provided mixtures of diastereomers 22:23 ( $14: 1,87 \%$ ) and 24:25 (3:1, 80\%), respectively. While the spectroscopic and physical data for major cycloadducts 19, 22 (X-ray), ${ }^{18}$ and 24 for each of these reactions were in full agreement with the C-2 substituent providing bias for the anti approach of the dieneophile, the stereochemical assignment of the minor adducts 20,23 , and 25 was not immediately straightforward.

In theory, there are four possible isomers from each of these reactions (Scheme 4). Endo approach of the dienophile from the $\alpha$-face via transition structure 26 leads to the observed major diatereomer 19 when $N$-phenylmaleimide serves as the dienophile. Exo approach via transition structure 28 would lead to 29 . However, if the

## SCHEME 3

## SCHEME 4

C-2 substituent does not provide a sufficient steric influence, endo approach from the $\beta$-face would lead to 20 and exo approach from the same face would lead to 31. Due to the propensity of maleimides, and cyclic dienophiles in general, to preferentially approach dienes in an endo fashion due to secondary orbital interactions, ${ }^{19}$ the formation of $\mathbf{2 9}$ and $\mathbf{3 1}$ seemed unlikely. The stereochemistry of the minor cycloadduct 20 was unequivocally established by both low-temperature and high-temperature NMR experiments. A series of nOe experiments clearly established the all-cis configuration of the maleimide and octahydroquinoline ring junction. ${ }^{18}$ In addition, the reaction of $\mathbf{1 8}$ with 4-methyl-1,2,4-triazole-3,5-dione (32) provided a 3.5:1 mixture of diastereomers

[^4]
## SCHEME 5

33 and 34 in 95\% combined yield (Scheme 5). In this case only approach of the dienophile from both the $\alpha$ and $\beta$ face would furnish the diastereomeric mixture that further reinforced our stereochemical assignment of $\mathbf{2 0}$, 23, and 25 (Scheme 3).

To further explore the synthetic utility of the process, reduction of the C-4 carbonyl group of dihydropyridone 5 was studied (Scheme 6). While the C-2 substitutent

## SCHEME 6

plays a critical role in controlling the diastereoselectivity of the Diels-Alder reaction, what role the C-4 hydroxyl group would play invited investigation. Luche reduction of $\mathbf{5}$ provided diastereomers $\mathbf{3 5}$ and $\mathbf{3 6}$ as a 83:17 mixture in a combined yield of $89 \%$. The isomers were easily separated by silca gel chromatography. Individual reaction of $\mathbf{3 5}$ and $\mathbf{3 6}$ with $N$-phenylmaleimide in refluxing toluene for 30 min gave cycloadducts $\mathbf{3 7}$ and $\mathbf{3 8}$ as single diastereomers in $87 \%$ and $93 \%$ yield, respectively. In similar fashion, reaction of 35 with cyclopentenone provided 39 in $68 \%$ isolated yield. The stereochemistry of each of these cycloadducts was established by NMR analysis, and the results demonstrated that the C-4 hydroxyl group did not provide any significant amount of influence over the approach of the dienophile.

In an approach to the ring system of gephyrotoxin, we examined the Diels-Alder reaction of diene 41 (Scheme 7). The axial hydroxyl group of diene 41 was required to effect a stereoselective ortho ester Claisen rearrangement later in the synthesis to establish the C-6 stereocenter of the gephyrotoxin ring system (vida infra). It was envisioned that the use of benzodithiin tetraoxide as the dienophile, which is an ethylene equivalent via subsequent desulfonylation, would provide an attractive extension of this work and provide the core decahydroquinoline skeleton of gephyrotoxin in a limited number of steps. Reduction of 21 under Luche conditions provided 40 in $92 \%$ yield with the expected, but undesired, C-4 stereochemistry, and only a minor amount of the desired diastereomer 41 (4\%) was formed. After extensive experimentation, it was discovered that reduction of $\mathbf{2 1}$ with diisobutylaluminum 2,6-di-tert-butylphenoxide (DIB• BHT $)^{20}$ provided the needed diastereomer 41 in $67 \%$ yield as a 30:1 (41:40) mixture that was easily separated by

[^5]
## SCHEME 7

## SCHEME 8

chromatography. Alternatively, 41 could be prepared by DIB•BHT reduction of iodide 42 followed by Stille cross coupling of the major isomer to give 41 in $41 \%$ overall yield from 42.

The reaction of 41 with benzodithiin tetraoxide gave an extremely complex mixture of diastereomers that were difficult to separate by conventional chromatography. On the other hand, protection of 41 as pivaloyl ester 43 (70\%) prior to cyclization proved fruitful (Scheme 8). The DielsAlder reaction of $\mathbf{4 3}$ with benzodithiin tetraoxide gave a $3: 1$ mixture of $\mathbf{4 4}$ and $\mathbf{4 5}$ in $79 \%$ combined yield. The pivaloyl group could be easily removed by treatment of 44 with DIBAL in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to give 46 in $78 \%$ yield. Reaction of 46 with triethyl orthoacetate in the presence of a catalytic amount of propionic acid furnished 47 in $67 \%$ yield where the relative stereochemistry of all five chiral centers was unequivocally established by singlecrystal X-ray analysis. ${ }^{18}$ The synthesis of 47 represents

a potential route to gephyrotoxin as three of the five stereocenters of the target ring system have been set with complete regio- and stereocontrol.

Tandem Diels-Alder Cyclization/Aromatization Reactions. During the course of the Diels-Alder studies of diene 5, interesting reactivity was observed with certain dienophiles leading to ring-opening of the initially formed cycloadducts of type $\mathbf{2}$. This methodology provides a route to uniquely substituted $\beta$-aminoketones, alcohols, and amino acids. For example, the Diels-Alder reaction of 5 with 1,4-naphthoquinone in refluxing toluene afforded the expected cycloadduct 48 in $84 \%$ isolated yield as a single diastereomer (Scheme 9). Analysis of the NMR spectrum of the crude product showed that 48 was the only isomer present, and the stereochemistry was in complete agreement with that observed for adducts listed in Table 1. However, attempted purification of 48 on silica gel resulted in the isolation of a new product that was identified as the anthraquinone derivative $\mathbf{5 0}$ on the basis of its spectral properties and high-resolution mass spectra. We suspect that 50 arises from air oxidation of 48 to 49, which is followed by silica gel promoted aromatization of the quinone moiety via ejection of the carbamate functionality leading to $\mathbf{5 0}$. The formation of 50 could be effected in a one-pot procedure by adding

## SCHEME 10

silica gel to the Diels-Alder adduct 48 in toluene and stirring overnight at room temperature to give $\mathbf{5 0}$ in $88 \%$ yield from 5 . Reaction of 5 with 1,4-benzoquinone also occurred in refluxing toluene to give the initially formed cycloadduct as an unstable single diastereomer. When subjected to silica gel-promoted oxidative rearrangement, naphthoquinone derivative 51 was isolated in $69 \%$ yield from 5 . In similar fashion, reaction of 35 with 1,4 -benzoquinone followed by the direct addition of silica gel and stirring overnight gave $\beta$-amino alcohol 52 in $88 \%$ yield as a single product.

When diene 5 was allowed to react with DMAD or di-tert-butylacetylene dicarboxylate in refluxing toluene, the initially formed cycloadducts 53 could not be isolated (Scheme 10). Instead, intermediate 53 rapidly aromatized via ejection of the phenyl carbamate to give the substituted benzene derivatives 54 and 55 in $71 \%$ and $85 \%$ yields, respectively. There was no detectable amount of 53 in the crude reaction mixture even when the reaction was stopped prior to complete conversion of starting materials.

We also investigated the reaction of 5 with benzyne (Scheme 10). Treatment of a mixture of $\mathbf{5}$ and triflate 56 in acetonitrile with $\mathrm{TBAF}^{21}$ resulted in the rapid forma-

[^6]SCHEME 11

tion of ring-opened naphthalene derivative 57 as the sole product in $62 \%$ isolated yield. Once again, the initially formed cycloadduct could not be isolated and underwent rapid aromatization via ejection of the phenyl carbamate. To investigate the possibility of synthesizing more highly functionalized systems, we prepared diene 59 from the known dihydropyridone $58 .{ }^{22}$ Iodination of 58 with NIS/cat. [hydroxyl(tosyloxy)iodo]benzene (HTIB) followed by Stille coupling with tributyl(vinyl)tin gave $\mathbf{5 9}$ in $45 \%$ overall yield. ${ }^{10}$ Reaction of $\mathbf{5 9}$ with benzyne under the conditions described above afforded compound $\mathbf{6 0}$ as a single diastereomer in $62 \%$ yield with the stereochemistry as shown.

Finally, we investigated an approach to $\alpha$-amino acids by taking advantage of the vinyl substituent at the C-2 position of diene $\mathbf{6 2}$ for further elaboration to a carboxylic acid group (Scheme 11). Diene 62 was prepared from dihydropyridone $\mathbf{6 1}{ }^{23}$ via the iodination/Stille coupling procedure as previously described. Reaction of $\mathbf{6 2}$ with benzyne in acetonitrile yielded the expected naphthalene product 63 arising from the tandem Diels-Alder cyclization/aromatization protocol in $66 \%$ yield. Treatment of 63 with sodium periodate in the presence of osmium tetroxide gave aldehyde 64 in near quantitative yield. Oxidation of $\mathbf{6 4}$ to amino acid $\mathbf{6 5}$ was accomplished with sodium chlorite/sodium phosphate solution in a $2: 1$ mixture of $t$ - $\mathrm{BuOH}: 2$-methyl-2-butene in $86 \%$ yield.

In conclusion, the Diels-Alder reaction of 2-substituted $N$-acyl-5-vinyl-2,3-dihydro-4-pyridones provides a highly efficient means of preparing octahydroquinolines, $\beta$-amino ketones, alcohols, and amino acids containing various functionalities. By taking advantage of the C-2 axial substituent, three contiguous centers can be set in a single synthetic operation. Although this study used racemic starting materials, the methodology can lead to enantiopure products of either antipode by starting with readily available nonracemic dihydropyridones. ${ }^{24}$ In addition, this synthetic protocol may be useful for the preparation of advanced intermediates for alkaloid syn-

[^7]thesis, as well as preparation of stereodefined hydroxy amino alcohols and hydroxy amino acids, functional arrays which are well recognized as important components for various protease inhibitors and other potential pharmaceuticals. ${ }^{25}$

## Experimental Section

$\left(2 R^{*}, 6 \mathrm{aS}^{*}, 9 \mathrm{aS}{ }^{*}, 9 \mathrm{~b} R^{*}\right)$-4,7,9-Trioxo-2,8-diphenyl-1-((phe-noxy)carbonyl)-2,3,4,6,6a,7,8,9,9a,9b-decahydropyrrolo-[3,4-h]quinoline (6). To a solution of $68 \mathrm{mg}(0.213 \mathrm{mmol})$ of $\mathbf{5}$ in 7 mL of toluene was added 47 mg ( 0.271 mmol ) of N -phenylmaleimide. The mixture was heated at reflux for 12 h , cooled to room temperature, and concentrated under reduced pressure. The crude residue was purified by radial PLC (silica gel, EtOAc/hexanes) to give $100 \mathrm{mg}(96 \%)$ of $\mathbf{6}$ as a white solid: mp 199-200 ${ }^{\circ} \mathrm{C}$ (EtOAc/hexanes); IR (thin film) 3034, 2929, 1707, 1613, 1493, 1383, 1190, $756 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 2.41(\mathrm{~m}, 1 \mathrm{H}), 2.84(\mathrm{dd}, 1 \mathrm{H}, J=15.6$ and $2.3 \mathrm{~Hz}), 3.17(\mathrm{dd}, 1 \mathrm{H}, J=15.6$ and 7.9 Hz$), 3.31(\mathrm{dd}, 1 \mathrm{H}, J=$ 15.6 and 6.3 Hz ), $3.44(\mathrm{t}, 1 \mathrm{H}, J=8.2 \mathrm{~Hz}$ ), $4.71(\mathrm{~m}, 1 \mathrm{H}), 5.01$ $(\mathrm{m}, 1 \mathrm{H}), 5.94(\mathrm{~m}, 1 \mathrm{H}), 6.86(\mathrm{~m}, 1 \mathrm{H}), 7.07-7.50(\mathrm{~m}, 15 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 25.6,39.9,42.5,44.3,55.9,58.4$, $121.9,125.6,126.0,126.6,128.1,129.2,129.5,129.6,131.6$, 135.8, 141.7, 151.1, 155.0, 176.2, 177.5, 191.7.

The second product to elute from the column ( $700 \mathrm{mg}, 83 \%$ ) was identified as ( $2 S^{*}, 6 \mathrm{a} S^{*}, 9 \mathrm{a} S^{*}, 9 \mathrm{~b} S^{*}$ )-2-methyl-4,7,9-trioxo-8-phenyl-2,3,4,6,6a,7,8,9,9a,9b-decahydropyrrolo [3,4-h]quino-line-1-carboxylic acid phenyl ester (19) and was obtained as a colorless solid: mp $179-180{ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta$ $1.35(\mathrm{~d}, 3 \mathrm{H}, J=6.7 \mathrm{~Hz}), 2.33(\mathrm{~m}, 1 \mathrm{H}), 2.44(\mathrm{~d}, 1 \mathrm{H}, J=15.5$ Hz ), $3.02(\mathrm{~m}, 1 \mathrm{H}), 3.12(\mathrm{~m}, 1 \mathrm{H}), 3.37(\mathrm{~m}, 1 \mathrm{H}), 4.67(\mathrm{~m}, 2 \mathrm{H})$, $4.97(\mathrm{~m}, 1 \mathrm{H}), 7.09(\mathrm{~m}, 2 \mathrm{H}), 7.17(\mathrm{~m}, 3 \mathrm{H}), 7.27(\mathrm{~m}, 1 \mathrm{H}), 7.41$ (m, 5H); ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right) \delta 20.6,25.3,39.4,42.1$, $43.8,49.9,53.9,121.7,125.8,126.4,128.9,129.3,129.5,131.5$, 135.1, 135.8, 151.1, 154.5, 175.9, 177.4, 192.4. Anal. Calcd for $\mathrm{C}_{25} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O}_{5}$ : C, 69.76; H, 5.15; N, 6.51. Found: C, 69.69; H, 5.11; N, 6.49.

2-(3-Benzyloxypropyl)-1-(phenoxycarbonyl)-5-vinyl-2,3-dihydro-4-pyridone (21). Magnesium turnings ( 1.06 g , 43.6 mmol ) were mechanically activated by stirring under argon overnight. To the activated Mg was added 13 mL of THF, two drops of dibromoethane, and $5.00 \mathrm{~g}(21.8 \mathrm{mmol})$ of benzyl 3-bromopropyl ether. The formation of the Grignard was complete after 1.5 h . The Grignard was transferred via double tipped needle to a stirred solution of $1.11 \mathrm{~g}(10.9 \mathrm{mmol})$ of 4-methoxypyridine in 26 mL of THF at $-42^{\circ} \mathrm{C}$. Phenyl chloroformate ( $1.517 \mathrm{~mL}, 10.9 \mathrm{mmol}$ ) was quickly added, and the resulting solution was stirred at $-42{ }^{\circ} \mathrm{C}$ for 30 min . The reaction mixture was quenched with $10 \% \mathrm{HCl}$, stirred at room temperature for 1 h , and extracted with diethyl ether ( $3 \times 2$ mL ). The combined extracts were washed with brine ( 2 mL ) and dried over $\mathrm{MgSO}_{4}$. The solvent was removed under reduced pressure, and the residue was purified by radial PLC (silica gel, $5-10 \% \mathrm{EtOAc} / \mathrm{hexanes}$ ) to give 3.74 g ( $94 \%$ ) of 2-(3-benzyloxypropyl)-1-(phenoxycarbonyl)-2,3-dihydro-4-pyridone as a clear oil: IR (neat) 3456, 3324, 3064, 2944, 2862, 1738, 1672, 1604, 1494, 1423, 1333, 1270, 1192, 1099, 991, 750, $690 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta 1.64-1.92(\mathrm{~m}, 4 \mathrm{H})$, $2.53(\mathrm{~d}, 1 \mathrm{H}, J=17.2 \mathrm{~Hz}), 2.92(\mathrm{dd}, 1 \mathrm{H}, J=16.4$ and 6.4 Hz$)$, $3.48(\mathrm{t}, 2 \mathrm{H}, J=5.6 \mathrm{~Hz}), 4.47$ (s, 2H), 4.78 (s, 1H), 5.43 (d, 1H, $J=7.6 \mathrm{~Hz}), 7.14-7.43(\mathrm{~m}, 10 \mathrm{H}), 7.87(\mathrm{~d}, 1 \mathrm{H}, J=8.0 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right) \delta 26.2,27.9,40.2,53.8,69.7,73.2$, 121.4, 126.6, 127.8, 128.5, 129.7, 138.4, 141.1, 150.6, 193.1; HRMS calcd for $\mathrm{C}_{22} \mathrm{H}_{23} \mathrm{NO}_{4}\left([\mathrm{M}+\mathrm{H}]^{+}\right) 366.1705$, found 366.1722 .

To a stirred solution of $3.70 \mathrm{~g}(10.1 \mathrm{mmol})$ of the above dihydropyridone in 100 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $0^{\circ} \mathrm{C}$ was added 15.1 $\mathrm{mL}(15.1 \mathrm{mmol})$ of 1.0 M ICl in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The solution was stirred at $0^{\circ} \mathrm{C}$ for 2 h in the dark and then neutralized with saturated aqueous $\mathrm{NaHCO}_{3}$. The aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 10 \mathrm{~mL})$. The combined organic extracts were washed with saturated aqueous $\mathrm{Na}_{2} \mathrm{SO}_{3}$ and brine $(1 \times 10 \mathrm{~mL}$ each) and then dried over $\mathrm{K}_{2} \mathrm{CO}_{3}$. The solvent was removed under reduced pressure and the residue was purified by radial PLC (silica gel, $5 \% \mathrm{EtOAc} /$ hexanes) to afford $4.71 \mathrm{~g}(95 \%)$ of ( $2 S^{*}$ )-2-(3-benzyloxypropyl)-5-iodo-1-(phenoxycarbonyl)-2,3-di-hydro-4-pyridone (42) as a yellow oil: IR (neat) 3063, 2927, 2860, 1738, 1878, 1582, 1494, 1388, 1312, 1260, 1199, 1144, 1103, 1026, 998, 914, 838, $751,691 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$, $400 \mathrm{MHz}) \delta 1.61-1.89(\mathrm{~m}, 5 \mathrm{H}), 2.82(\mathrm{~d}, 1 \mathrm{H}, J=16.4), 2.95$ (dd, $1 \mathrm{H}, J=16.4$ and 6.4 Hz ), 3.46 (t, $2 \mathrm{H}, J=6.0$ ), 4.45 (s, $2 \mathrm{H}), 4.80(\mathrm{~d}, 1 \mathrm{H}, J=6.0), 7.15(\mathrm{~d}, 1 \mathrm{H}, J=8.0), 7.24-7.42(\mathrm{~m}$, 9H), 8.39 (s, 1H); ${ }^{13} \mathrm{C}$ NMR ( $\mathrm{CDCl}_{3}, 100 \mathrm{MHz}$ ) $\delta 26.0,27.9$, $38.8,54.1,69.4,73.0,121.2,126.6,127.6,127.7,128.4,129.7$,
138.2, 146.4, 150.2, 186.6; HRMS calcd for $\mathrm{C}_{22} \mathrm{H}_{22} \mathrm{INO}_{4}([\mathrm{M}+$ $\mathrm{H}]^{+}$) 492.0672, found 492.0661.

To a solution of $2.00 \mathrm{~g}(4.07 \mathrm{mmol})$ of the above iodide in 20 mL of toluene was added $249 \mathrm{mg}(0.184 \mathrm{mmol})$ of $\mathrm{AsPh}_{3}$ and $93 \mathrm{mg}(0.10 \mathrm{mmol})$ of $\mathrm{Pd}_{2} \mathrm{dba}_{3}$. The resulting solution was degassed with argon for 15 min . Tributylvinyltin ( 1.54 mL , 5.29 mmol ) was added, and the mixture was heated to $50^{\circ} \mathrm{C}$ for 2 h and then cooled to room temperature. A solution of 1:1 EtOAc: $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$ was added, and the aqueous layer was extracted with EtOAc $(3 \times 5 \mathrm{~mL})$. The combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and concentrated under reduced pressure. The residue was purified by radial PLC (silica gel, 5\% EtOAc/hexanes) to give 1.29 g (81\%) of 21 as a clear oil: IR (neat) $3064,2945,2859,1737,1673,1590$, $1320,1264,1198,1104 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta$ $1.55-1.90(\mathrm{~m}, 4 \mathrm{H}), 2.58(\mathrm{dd}, 1 \mathrm{H}, J=16.1$ and 1.5 Hz$), 2.95$ (dd, $1 \mathrm{H}, J=16.5$ and 6.2 Hz ), $3.48(\mathrm{t}, 2 \mathrm{H}, J=5.9 \mathrm{~Hz}$ ), 4.46 (s, $2 \mathrm{H}), 4.79$ (d, 1H, $J=5.9 \mathrm{~Hz}$ ), $5.16(\mathrm{~d}, 1 \mathrm{H}, J=7.0 \mathrm{~Hz}, 5.79$ (dd, $1 \mathrm{H}, J=17.6,1.5 \mathrm{~Hz}$ ), 6.41 (dd, $1 \mathrm{H}, J=17.6,11.7$ ), 7.16 (d, $1 \mathrm{H}, J=22.0 \mathrm{~Hz}), 7.15-7.44(\mathrm{~m}, 9 \mathrm{H}), 7.97(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 26.1,28.0,40.5,53.6,69.6,73.0,114.7$, $121.4,126.5,127.7,127.8,128.5,129.1,129.7,138.3,150.5$, 191.7; HRMS calcd for $\mathrm{C}_{24} \mathrm{H}_{25} \mathrm{NO}_{4}\left([\mathrm{M}+\mathrm{H}]^{+}\right) 392.1862$, found 392.1859.

Diels-Alder Reaction of 21 with $\boldsymbol{N}$-Phenylmaleimide. To a stirred solution of $35 \mathrm{mg}(0.09 \mathrm{mmol})$ of $\mathbf{2 1}$ in 2 mL of toluene was added $30 \mathrm{mg}(0.18 \mathrm{mmol})$ of $N$-phenylmaleimide. The mixture was refluxed for 17 h and then the solvent was removed under reduced pressure. The residue was purified by radial PLC (silica gel, $10 \% \mathrm{EtOAc} /$ hexanes) to afford 44 mg ( $87 \%$ ) of 22 as a colorless solid: mp $193^{\circ} \mathrm{C}$; IR ( NaCl ) 2919 , 2867, 1701, 1614, 1494, 1380, $1271 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 7.46-7.06(\mathrm{~m}, 16 \mathrm{H}), 4.87-4.83(\mathrm{~m}, 2 \mathrm{H}), 4.63(\mathrm{br} \mathrm{s}$, 1 H ), 4.45 (s, 2H), $3.51-3.46$ (m, 2H), 3.36 (t, $1 \mathrm{H}, J=8.0 \mathrm{~Hz}$ ), $3.12(\mathrm{dd}, 1 \mathrm{H}, J=8.0 \mathrm{~Hz}), 2.99(\mathrm{dd}, 1 \mathrm{H}, J=15.6$ and 4.8 Hz ), 2.57 (dd, 1H, $J=16.0$ and 2.4 Hz ), 2.34-2.27 (m, 1H), 1.90$1.65(\mathrm{~m}, 4 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ), $\delta 192.4,177.7,176.0$, $154.8,151.2,138.5,136.2,135.3,131.6,129.7,129.5,129.1$, $128.6,127.9,126.6,126.1,122.0,73.2,69.7,54.0,53.8,41.9$, 39.6, 31.7, 26.5, 25.5; HRMS calcd for $\mathrm{C}_{34} \mathrm{H}_{32} \mathrm{~N}_{2} \mathrm{O}_{6}\left([\mathrm{M}+\mathrm{H}]^{+}\right)$ 565.2339, found 565.2333.

Diels-Alder Reaction of 21 with Benzodithiin Tetraoxide. To a solution of $1.17 \mathrm{~g}(2.30 \mathrm{mmol})$ of $\mathbf{2 1} \mathrm{in} 21 \mathrm{~mL}$ of toluene was added $655 \mathrm{mg}(2.85 \mathrm{mmol})$ of benzodithiin tetraoxide. ${ }^{17}$ The mixture was degassed for 10 min by bubbling nitrogen through the solution and then was heated to $90^{\circ} \mathrm{C}$ for 18 h . The reaction was cooled to room temperature and concentrated under reduced pressure. The major isomer was obtained by recrystalization of the crude reaction mixture from hot toluene to give $1.06 \mathrm{~g}(60 \%)$ of ( $2 R^{*}, 6 \mathrm{a} R^{*}, 12 \mathrm{a} S^{*}, 12 \mathrm{~b} S^{*}$ )-2-(3-benzyloxypropyl)-1-(phenoxycarbonyl)-4,7,7,12,12-pentaoxo$3,4,6,6 \mathrm{a}, 7,12,12 \mathrm{a}, 12 \mathrm{~b}$-octahydro-2H-7 ${ }^{6}$, $12 \lambda^{6}$-dithia-1-azabenzo[ $\alpha$ ]anthracene (24) as a white solid: $\mathrm{mp} 156-157^{\circ} \mathrm{C}$; IR (thin film) $2850,2359,1702,1628,1432,1329,1198,1129,912,735$, $702 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR (DMSO, 300 MHz ) $\delta 1.50-1.85(\mathrm{~m}, 2 \mathrm{H})$, $2.60-2.80(\mathrm{~m}, 3 \mathrm{H}), 2.80-3.20(\mathrm{~m}, 3 \mathrm{H}), 3.51(\mathrm{t}, 2 \mathrm{H}, J=6.0$ Hz ), $4.46(\mathrm{~s}, 2 \mathrm{H}), 4.64(\mathrm{t}, 1 \mathrm{H}, J=5.1 \mathrm{~Hz}), 4.99-5.06(\mathrm{~m}, 1 \mathrm{H})$, $5.42(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 5.89(\mathrm{t}, 1 \mathrm{H}, J=4.5 \mathrm{~Hz}), 6.70(\mathrm{~d}, 1 \mathrm{H}, J=2.7$ $\mathrm{Hz}), 7.18-7.44(\mathrm{~m}, 10 \mathrm{H}), 7.96-8.08(\mathrm{~m}, 4 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, $75 \mathrm{MHz}) \delta 24.0,26.9,30.7,55.2,56.6,58.0,58.5,69.8,73.1$, $77.6,121.9,125.2,125.5,126.2,127.8,128.6,129.7,132.9$, 133.1, 133.6, 134.0, 135.2, 138.6, 139.4, 150.8, 196.0; HRMS calcd for $\mathrm{C}_{32} \mathrm{H}_{31} \mathrm{NO}_{8} \mathrm{~S}_{2}\left([\mathrm{M}+\mathrm{H}]^{+}\right)$622.1569, found 622.1572.

The minor isomer ( $354 \mathrm{mg}, 20 \%$ ) was isolated as clear oil from the mother liquers and identified as $\left(2 S^{*}, 6 \mathrm{a} R^{*}, 12 \mathrm{a} S^{*}\right.$,12b $S^{*}$ )-2-(3-(benzyloxy)propyl)-4,7,7,12,12-pentaoxo-3,4,6,6a,7,12,12a, 12b-octahydro- $2 H^{-7} \lambda^{6}, 12 \lambda^{6}$-dithia-1-azabenzo[a]an-thracene-1-carboxylic acid phenyl ester (25) as a clear oil: IR (neat) $3064,3026,2926,2872,1721,1706,1631,1593,1407$, 1323, 1205, 1150, 1131, $751 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR (DMSO, 300 MHz ) $\delta 1.50-2.01(\mathrm{~m}, 4 \mathrm{H}), 2.49(\mathrm{~s}, 2 \mathrm{H}), 2.94-3.17(\mathrm{~m}, 2 \mathrm{H}), 3.46-$ $3.58(\mathrm{~m}, 2 \mathrm{H}), 4.49(\mathrm{~s}, 3 \mathrm{H}), 4.61-4.81(\mathrm{~m}, 3 \mathrm{H}), 5.91(\mathrm{~d}, 1 \mathrm{H}, J=$

( $2 R^{*}, 4 S^{*}$ )-(2-Benzyloxypropyl)-4-hydroxy-1-(phenoxy-carbonyl)-5-vinyl-3,4-dihydro- $2 \boldsymbol{H}$-pyridine (40). To a mixture of $932 \mathrm{mg}(2.38 \mathrm{mmol})$ of 21 and $975 \mathrm{mg}(2.62 \mathrm{mmol})$ of $\mathrm{CeCl}_{3} \cdot 7 \mathrm{H}_{2} \mathrm{O}$ in 43 mL of MeOH at $-20^{\circ} \mathrm{C}$ was added portionwise $117 \mathrm{mg}(3.09 \mathrm{mmol})$ of $\mathrm{NaBH}_{4}$. After 45 min at $-20^{\circ} \mathrm{C}$, the reaction was quenched with water $(5 \mathrm{~mL})$, and the MeOH was removed under reduced pressure. The remaining aqueous solution was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 5 \mathrm{~mL})$. The combined organic extracts were dried over $\mathrm{K}_{2} \mathrm{CO}_{3}$, filtered, and concentrated under reduced pressure. Purification of the residue by radial PLC (silica gel, 5\% EtOAc/hexanes/1\% TEA) gave 861 $\mathrm{mg}(92 \%)$ of $\mathbf{4 0}$ as a clear oil: IR (neat) $3435,3054,3030,2930$, 2863, 1722, 1637, 1494, 1424, 1344, $1199 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 1.67-1.76(\mathrm{~m}, 5 \mathrm{H}), 1.89-1.99(\mathrm{~m}, 2 \mathrm{H})$, $2.38-2.45(\mathrm{~m}, 1 \mathrm{H}), 3.52$ (dd, $2 \mathrm{H}, J=10.2,9.4 \mathrm{~Hz}$ ), 4.44 (s, $1 \mathrm{H}), 4.50(\mathrm{~s}, 2 \mathrm{H}), 4.65-4.72(\mathrm{~m}, 1 \mathrm{H}), 5.12(\mathrm{~d}, 1 \mathrm{H}, J=11.0$ $\mathrm{Hz}), 5.38(\mathrm{~d}, 1 \mathrm{H}, J=18.3 \mathrm{~Hz}), 6.26(\mathrm{dd}, 1 \mathrm{H}, J=17.6$ and 11.0
$\mathrm{Hz}), 7.02(\mathrm{~s}, 1 \mathrm{H}), 7.14(\mathrm{~d}, 2 \mathrm{H}, J=8.8 \mathrm{~Hz}), 7.22-7.42(\mathrm{~m}, 7 \mathrm{H})$; ${ }^{13} \mathrm{C}$ NMR ( $\left.\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 26.6,28.3,35.2,52.2,61.3,70.0$, $73.1,112.8,120.9,121.7,125.7,126.0,127.7,127.8,128.6$, 129.6, 134.4, 138.6, 151.0, 151.8; HRMS calcd for $\mathrm{C}_{24} \mathrm{H}_{27} \mathrm{NO}_{4}$ $\left([\mathrm{M}]^{+}\right) 393.1904$, found 393.1942 .

The minor product (41, $36.4 \mathrm{mg}, 4 \%$ ) was isolated as a clear oil: IR (neat) $3475,2923,2855,2359,1723,1643,1336,1197$, $1054 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta 1.68-1.96(\mathrm{~m}, 6 \mathrm{H})$, $2.28(\mathrm{~d}, 1 \mathrm{H}, J=15.2 \mathrm{~Hz}), 3.50(\mathrm{br} \mathrm{s}, 2 \mathrm{H}), 4.41-4.49(\mathrm{~m}, 3 \mathrm{H})$, 4.58 ( $\mathrm{s}, 1 \mathrm{H}$ ), 5.05 (t, 1H, $J=16.8 \mathrm{~Hz}$ ), 5.31 ( $\mathrm{t}, 1 \mathrm{H}, J=16.8$ ), $6.27-6.34(\mathrm{~m}, 1 \mathrm{H}), 7.06-7.37(\mathrm{~m}, 11 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100\right.$ MHz ) $\delta$ 27.1, 28.8, 29.2 (due to rotamers), 31.7, 50.5, 51.2 (due to rotamers), $60.2,70.3,73.1,110.4,110.8,119.3,119.8$ (due to rotamers), $121.8,126.0,126.6,127.8,128.5,129.6,135.5$, 138.7, 151.0, 151.6, 152.3 (due to rotamers); HRMS calcd for $\mathrm{C}_{24} \mathrm{H}_{27} \mathrm{NO}_{4}\left([\mathrm{M}]^{+}\right) 393.1904$, found 393.1937.
( $2 R^{*}, 4 S^{*}$ )-(2-Benzyloxypropyl)-4-hydroxy-1-(phenoxy-carbonyl)-5-vinyl-3,4-dihydro-2H-pyridine (41). Method A. A solution of $10.18 \mathrm{~mL}(10.1 \mathrm{mmol}, 1.0 \mathrm{M}$ in toluene) of diisopropyl aluminum hydride was added dropwise to 4.48 g ( 20.3 mmol ) of 2,6-di-tert-butyl-4-methylphenol in 48 mL of toluene at $0{ }^{\circ} \mathrm{C}$. The solution was stirred at $0{ }^{\circ} \mathrm{C}$ for 1 h and then cooled to $-78^{\circ} \mathrm{C}$. A solution of $797 \mathrm{mg}(2.0 \mathrm{mmol})$ of $\mathbf{2 1}$ in 5 mL of toluene was added, and the resulting red solution was allowed to stir at $-78^{\circ} \mathrm{C}$ for 1 h and then placed in a -30 ${ }^{\circ} \mathrm{C}$ freezer for 3 h . The resulting yellow solution was quenched with 5 mL of saturated aqueous $\mathrm{NaHCO}_{3}$, and the aqueous layer was extracted with $\mathrm{EtOAc}(3 \times 5 \mathrm{~mL})$. The combined organic extracts were washed with brine ( 5 mL ) and dried over $\mathrm{MgSO}_{4}$. The solvent was removed under reduced pressure, and the residue was purified by radial PLC (silica gel, 5-20\% EtOAc/hexanes) to give 583 mg ( $73 \%$ ) of 41 as a clear oil, which was identical with the minor product isolated by Luche reduction of 21.

Method B. A solution of $10.95 \mathrm{~mL}(10.9 \mathrm{mmol}, 1.0 \mathrm{M}$ in toluene) of diisopropyl aluminum hydride was added dropwise to 4.83 g ( 21.9 mmol ) of 2,6-di-tert-butyl-4-methylphenol in 50 mL toluene at $0{ }^{\circ} \mathrm{C}$. The solution was stirred at $0{ }^{\circ} \mathrm{C}$ for 1 h and then cooled to $-78^{\circ} \mathrm{C}$. A solution of $538 \mathrm{mg}(1.1 \mathrm{mmol})$ of 42 in 5 mL of toluene was added dropwise to give a red solution that was stirred at $-78{ }^{\circ} \mathrm{C}$ for 1 h and then placed in a -30 ${ }^{\circ} \mathrm{C}$ freezer for 3 h . The resulting yellow solution was poured into ice cold $1 \% \mathrm{HCl}(30 \mathrm{~mL})$ and extracted with EtOAc ( $3 \times$ 10 mL ), and the combined extracts were dried over $\mathrm{MgSO}_{4}$. The solvent was removed under reduced pressure, and the residue was purified by radial PLC (silica gel, $10 \% \mathrm{EtOAc} /$ hexanes) to give 409.3 mg ( $76 \%$ ) of ( $2 R^{*}, 4 R^{*}$ )-2-(3-benzylox-ypropyl)-4-hydroxy-5-iodo-1-(phenoxycarbonyl)-3,4-dihydro$2 H$-pyridine as a clear oil: IR (neat) $3447,3085,3028,2992$, $2860,1724,1630,1597,1493,1553,1391,1308,1198,1094$, $1057 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta 1.63-1.92(\mathrm{~m}, 4 \mathrm{H})$, $2.07-2.11(\mathrm{~m}, 5 \mathrm{H}), 2.34(\mathrm{~d}, 1 \mathrm{H}, J=14.8 \mathrm{~Hz}), 2.42(\mathrm{~s}, 1 \mathrm{H})$, $3.48-3.50(\mathrm{~m}, 2 \mathrm{H}), 4.19(\mathrm{~s}, 1 \mathrm{H}), 4.46-4.48(\mathrm{~m}, 3 \mathrm{H}), 7.11(\mathrm{~d}$, $2 \mathrm{H}, J=7.6 \mathrm{~Hz}), 7.21-7.45(\mathrm{~m}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $\mathrm{CDCl}_{3}, 75 \mathrm{MHz}$ ) $\delta 26.4,28.4,33.8,52.4,65.2,69.8,73.1,83.6,121.6,126.0$, 127.8, 128.5, 129.6, 131.0, 138.4, 150.7; HRMS calcd for $\mathrm{C}_{22} \mathrm{H}_{24} \mathrm{INO}_{4}\left([\mathrm{M}]^{+}\right) 493.0750$, found 493.0736 .
A solution of the above iodide ( $2.355 \mathrm{~g}, 4.775 \mathrm{mmol}$ ) and palladium tetrakis(triphenyl)phosphine ( $386 \mathrm{mg}, 0.334 \mathrm{mmol}$, $7 \%$ ) in toluene ( 11 mL ) was degassed with argon. Tributyl(vinyl)tin ( $1.81 \mathrm{~mL}, 6.207 \mathrm{mmol}, 1.3$ equiv) was added dropwise at room temperature and then the mixture was warmed to 90 ${ }^{\circ} \mathrm{C}$ and stirred for 12 h (monitored by thin-layer chromatography). The reaction mixture was cooled to room temperature and poured into a $1: 1$ mixture of EtOAc: $\mathrm{H}_{2} \mathrm{O}$. The product was extracted with EtOAc. The combined organic layers were dried over sodium sulfate, filtered, and concentrated in vacuo. The product was purified by radial PLC (1\% TEA/5\% EtOAc/ hexanes) to afford $68 \%(1.272 \mathrm{~g})$ of 41 as a clear oil.
( $2 R^{*}, 4 R^{*}$ )-(2-Benzyloxypropyl)-(2,2-dimethylpro-pionyloxy)-4-hydroxy-1-(phenoxycarbonyl)-5-vinyl-3,4-dihydro- $2 \boldsymbol{H}$-pyridine (43). To a stirred solution ( 292 mg ,
0.74 mmol ) of 41 in 2 mL of THF at $-78^{\circ} \mathrm{C}$ was added $888 \mu \mathrm{~L}$ ( $0.09 \mathrm{mmol}, 1.0 \mathrm{M}$ ) of NaHMDS in THF. The solution was stirred for 30 min and then $182 \mu \mathrm{~L}(1.48 \mathrm{mmol})$ of pivaloyl chloride was added. After the solution was stirred for 2 h at $-78^{\circ} \mathrm{C}$, the reaction was quenched with saturated aqueous $\mathrm{NaHCO}_{3}(1 \mathrm{~mL})$. The aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}$ $(3 \times 1 \mathrm{~mL})$. The combined organic extracts were washed with brine ( 1 mL ) and dried over $\mathrm{K}_{2} \mathrm{CO}_{3}$. The solvent was removed under reduced pressure and the residue was purified by radial PLC (silica gel, 5\% EtOAc/hexanes) to afford $235 \mathrm{mg}(70 \%)$ of 43 as a clear oil: IR (neat) 2959, 2866, 2360, 2340, 1721, 1650, $1645,1311,1196 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta 1.20(\mathrm{~s}$, $9 \mathrm{H}), 1.61-2.26(\mathrm{~m}, 7 \mathrm{H}), 3.45-3.51(\mathrm{~m}, 2 \mathrm{H}), 4.42-4.50(\mathrm{~m}, 3 \mathrm{H})$, $4.94(\mathrm{~m}, 2 \mathrm{H}), 5.73(\mathrm{~d}, 1 \mathrm{H}, J=4.0 \mathrm{~Hz}), 6.26(\mathrm{~m}, 1 \mathrm{H}), 7.11-$ $7.41(\mathrm{~m}, 10 \mathrm{H})$; ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right) \delta 27.3,28.9,29.3$ (due to rotamers), 30.6, 39.1, 50.1, 50.7 (due to rotamers), 62.1 , 70.1, 73.3, 77.4, 110.7, 111.0 (due to rotamers), 116.1, 116.6 (due to rotamers), 121.7, 126.0, 127.7, 127.8, 128.2, 128.5, 129.7, 134.7, 138.5, 151.0, 151.7, 152.2 (due to rotamers), 178.1; HRMS calcd for $\mathrm{C}_{29} \mathrm{H}_{35} \mathrm{NO}_{5}\left([\mathrm{M}]^{+}\right) 477.2515$, found 477.2523 .

Diels-Alder Reaction of 43 with Benzodithiin Tetraoxide. To a solution of $33 \mathrm{mg}(0.07 \mathrm{mmol})$ of 43 in 2 mL of toluene was added $16 \mathrm{mg}(0.07 \mathrm{mmol})$ of benzodithiin tetraoxide. ${ }^{17}$ The solution was degassed with argon and then heated to reflux for 12 h . After being cooled to room temperature, the solution was concentrated under reduced pressure and the residue was purified by radial PLC (silica gel, 5-10\% EtOAc/ hexanes) to give $29 \mathrm{mg}(60 \%)$ of ( $2 R^{*}, 4 S^{*}, 6 \mathrm{a} R^{*}, 12 \mathrm{a} S^{*}, 12 \mathrm{~b} S^{*}$ )-2-(3-benzyloxypropyl)-4-(2,2-dimethylpropionyloxy)-1-(phe-noxycarbonyl)-7,7,12,12-tetraoxa-3,4,6,6a, $7,7,12,12 \mathrm{a}, 12 \mathrm{~b}$-oc-tahydro- $2 H-7 \lambda^{6}, 12 \lambda^{6}$-dithia-1-azabenzo $[\alpha]$ anthracene (44) as a white solid: mp 164.5-165.0 ${ }^{\circ} \mathrm{C}$; IR (neat) 2966, 2926, 2857, 1726, 1457, 1326, 1279, 1203, 1149, $752 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$, $300 \mathrm{MHz}) \delta 1.10-1.40(\mathrm{~m}, 9 \mathrm{H}), 1.70-1.90(\mathrm{q}, 2 \mathrm{H}, J=5.3 \mathrm{~Hz})$, $1.95-2.20(\mathrm{~m}, 2 \mathrm{H}), 2.23-2.40(\mathrm{~m}, 3 \mathrm{H}), 2.80-3.01(\mathrm{~m}, 2 \mathrm{H})$, $3.45-3.65(\mathrm{~m}, 2 \mathrm{H}), 3.85(\mathrm{t}, 1 \mathrm{H}, J=9.6), 4.16(\mathrm{q}, 1 \mathrm{H}, J=7.3)$, $4.55(\mathrm{~s}, 2 \mathrm{H}), 5.17-5.30(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 5.62(\mathrm{~d}, 1 \mathrm{H}, J=9.2 \mathrm{~Hz})$, $6.13(\mathrm{~s}, 1 \mathrm{H}), 7.10-7.60(\mathrm{~m}, 10 \mathrm{H}), 7.78-8.00(\mathrm{~m}, 2 \mathrm{H}), 8.04$, (d, $2 \mathrm{H}, J=8.0 \mathrm{~Hz}$; $\left.{ }^{13} \mathrm{CNMR}\left(\mathrm{CDCl}_{3}\right) 400 \mathrm{MHz}\right) \delta 22.0,26.1,27.7$, $34.2,37.0,50.2,51.0,58.4,62.0,69.4,70.6,73.3,82.9,118.0$, 121.4, 124.9, 125.4, 127.9, 128.0, 128.3, 128.5, 129.1, 130.9, $133.4,134.0,136.9,138.4,150.7,152.1,154.6$; HRMS calcd for $\mathrm{C}_{37} \mathrm{H}_{41} \mathrm{NO}_{9} \mathrm{~S}_{2}\left([\mathrm{M}+\mathrm{H}]^{+}\right) 708.2301$, found 708.2315.

Acknowledgment. We would like to thank Dr. Peter G. Dormer and Dr. Robert A. Reamer of Merck and Co., Inc. for valuable NMR assistance. We express appreciation to the National Institutes of Health (Grant GM 34442) for financial support of this research. The authors thank Dr. Paul Boyle for X-ray crystallographic analysis of $\mathbf{2 2}$ and $\mathbf{4 7}$. NMR and mass spectra and X-ray data were obtained at NCSU instrumentation laboratories, which were established by grants from the North Carolina Biotechnology Center and the National Science Foundation (Grants CHE-9509532 and CHE-0078253).

Supporting Information Available: Spectroscopic and analytical data for compounds $9-11,13 \mathbf{a} / \mathbf{b}, 14 \mathbf{a} / \mathbf{b}, \mathbf{1 5 a} / \mathbf{b}, \mathbf{1 6 a}$, 17, 21-22, 24-25, 35-36, 39-48, 50-52, 55, 60, 62, 64-65; ORTEP plots and X-ray crystal data for compounds 22 and 47 in CIF format.
