Received June 27, 2005

Both matched and mismatched diastereoselections have been observed in the aldol reactions of a range of chiral aldehydes with the dicyclohexylboron enolate of a chiral ethyl ketone related to L-erythrulose. As was previously observed in the corresponding aldol reactions with L-erythrulose derivatives, the Felkin-Anh model provides an adequate explanation for the stereochemical outcome of reactions with chiral $\alpha$-methyl aldehydes. However, a satisfactory account of the results observed with $\alpha$-oxygenated aldehydes was only possible with the Cornforth model. As a practical application of the methodology described herein, a $\mathrm{C}_{1}-\mathrm{C}_{9}$ fragment of the structure of the antifungal macrolide soraphen $\mathrm{A}_{1 \alpha}$ has been prepared in a convergent and stereoselective way.

## Introduction

The aldol reaction is a powerful and general method for the stereocontrolled construction of carbon-carbon bonds. ${ }^{1}$ Among the many enolate types used for this kind of reaction thus far, boron enolates are particularly versatile because of their good reactivity and excellent stereoselectivity. ${ }^{2}$ In recent years, we have investigated the outcome of the aldol reactions of boron enolates generated from dicyclohexylboron chloride, $\mathrm{Chx}_{2} \mathrm{BCl}$, with either the L-erythrulose derivative $\mathbf{1}^{3}$ or the structurally related ketone 2. ${ }^{4}$ This line of research has led to several different findings, with each result prompting us to expand our investigative efforts. One of our first findings concerning reactions with achiral aldehydes, for example,

[^0]was that, in contrast to the previously documented behavior of $\mathrm{Chx}_{2} \mathrm{BCl}$, ketones $\mathbf{1}$ and 2 give rise to syn aldols 3 and 4, respectively, with almost total stereoselectivity. ${ }^{5}$ In the case of $\mathbf{1}$, we were able to demonstrate that this is due to the fact that $\mathrm{Chx}_{2} \mathrm{BCl}$ promotes the formation of the boron $Z$-enolate rather than the expected $E$-enolate ${ }^{3 c}$ (although not experimentally investigated, it is reasonable to assume for 2 the same behavior and thus the selective formation of the $Z$-enolate). We further concluded that the boron $Z$-enolate of each ketone has a distinct stereofacial bias for attacking the $R e$ aldehyde carbonyl face. These results are of interest because when the aldol adducts are appropriately manipulated, $\mathbf{1}$ and 2 may be viewed as synthetic equivalents of chiral $\mathrm{d}^{2}$, $d^{3}$, and $d^{4}$ synthons (see Scheme 1), the latter two of which were reported for the first time in our study. ${ }^{3}$ These synthons, in turn, greatly facilitate the synthesis of polyoxygenated, sugar-like chains and polypropionate fragments, which are present in many biologically relevant natural products. ${ }^{6}$

## SCHEME 1. Aldol Additions of the Boron Z-Enolates of 1 and 2 to Achiral Aldehydes

After obtaining these results, we extended our study to the doubly diastereoselective ${ }^{1 \mathrm{c}}$ aldol reactions of ketone 1 with $\alpha$-chiral aldehydes (Scheme 2). We found that in the case of $\alpha$-methyl aldehydes $\mathbf{5 a}, \mathbf{b}$ of either configuration, the boron $Z$-enolate of $\mathbf{1}$ was able to exert the stereocontrol over the reaction. ${ }^{7}$ As with achiral alde-

Aldol reactions

hydes, the boron $Z$-enolate of $\mathbf{1}$ selectively attacked the $R e$ aldehyde carbonyl face. Thus, aldols $\mathbf{7 a}, \mathbf{b}$ and 8a,b were obtained as essentially single stereoisomers after reaction with the $(S)$ and $(R)$ enantiomers, respectively, of the aforementioned aldehydes (Scheme 2). ${ }^{8}$ In contrast, a distinct match/mismatch dichotomy was found when $\alpha$-oxygenated aldehydes were used. Thus, while a highly stereoselective aldol reaction occurred with aldehydes $(S)$ $\mathbf{6 a}-\mathbf{c},{ }^{9}$ leading to aldols $\mathbf{9 a}-\mathbf{c}$, only complex aldol mix-

(7) Marco, J. A.; Carda, M.; Díaz-Oltra, S.; Murga, J.; Falomir, E.; Roeper, H. J. Org. Chem. 2003, 68, 8577-8582.
(8) In the aldol reaction of ketone $\mathbf{1}$ with $(R)-5 \mathbf{b}$, an approximately 4:1 mixture of syn aldols was formed, according to the NMR data of the mixture. In our previous publication, ${ }^{7}$ we assumed that the not isolated, minor stereoisomer was the "anti-Felkin" stereoisomer, which resulted from attack to the aldehyde $S i$ face. However, we later found that aldehyde $\mathbf{5 b}$ is much more prone to racemization than its analogue 5a. We thus believe that the minor stereoisomer, which appears in the reaction mixture in variable proportions, is formed from the small proportion of the undesired enantiomer, generated adventitiously during the synthesis and isolation of the aldehyde. The preparation of aldehydes 5 has to be performed with extreme care, to keep racemization to a minimum (the results presented in this paper and in refs 7 and 9 are part of the Ph.D. thesis of S.D.-O., Universidad Jaume I, July 2005).
tures and extensive decomposition resulted when the $(R)$ enantiomers were used.

These results were not adequately explained with the Felkin-Anh paradigm alone, ${ }^{10}$ as this mechanistic model worked satisfactorily only in the reactions with $\alpha$-methyl aldehydes 5, but not with those involving $\alpha$-oxygenated aldehydes 6. Relying on recent results, ${ }^{11}$ we then proposed Cornforth's dipolar model as offering a more adequate explanation for the stereochemical outcome of aldol reactions of 1 with chiral aldehydes bearing polar $\alpha$-heteroatoms. ${ }^{12}$ This was the first time that this model had been applied to a doubly diastereoselective aldol reaction. ${ }^{1 c}$ In the present Article, we have extended the same approach to chiral ethyl ketone 2 in the belief that stereoselective aldol reactions of $\mathbf{2}$ with $\alpha$-methyl aldehydes and $\alpha$-oxygenated aldehydes will provide efficient access to polypropionate fragments such as those present in macrolides, polyether antibiotics, and related bioactive metabolites. ${ }^{6}$

## Results and Discussion

Aldol Reactions with $\alpha$-Methyl Aldehydes. To accomplish our objective, standard procedures were used to prepare the four enantiomerically pure aldehydes 5a,b and $\mathbf{6 a}, \mathbf{b}$ that we had employed in our previous study (Scheme 2). ${ }^{13}$ The aldol additions were performed under the conditions described in our earlier reports. ${ }^{3,14-17} \mathrm{We}$ started with the aldol reactions of ketone 2 and $\alpha$-methyl
(9) The methodology described in ref 7 has been applied to the stereoselective synthesis of the natural lactone anamarine: Díaz-Oltra, S.; Murga, J.; Falomir, E.; Carda, M.; Marco, J. A. Tetrahedron 2004, 60, 2979-2985.
(10) (a) Chérest, M.; Felkin, H.; Prudent, N. Tetrahedron Lett. 1968, 9, 2199-2204. (b) Anh, N. T. Top. Curr. Chem. 1980, 88, 145-162. (c) Mengel, A.; Reiser, O. Chem. Rev. 1999, 99, 1191-1223. See also, however: Smith, R. J.; Trzoss, M.; Bühl, M.; Bienz, S. Eur. J. Org. Chem. 2002, 2770-2775.
(11) Shortly before we concluded our investigation with ketone 1, a paper by Evans and co-workers appeared in which the Cornforth model was resurrected to provide a good explanation of the sterochemical outcome of aldol reactions of achiral ketones with $\alpha$-heteroatomsubstituted aldehydes: Evans, D. A.; Siska, S. J.; Cee, V. J. Angew. Chem., Int. Ed. 2003, 42, 1761-1765.
(12) Cornforth's model has been previously applied to reactions of $\alpha$-oxygenated aldehydes with achiral allylboron compounds: (a) Roush, W. R.; Adam, M. A.; Walts, A. E.; Harris, D. J. J. Am. Chem. Soc. 1986, 108, 3422-3434. (b) Brinkmann, H.; Hoffmann, R. W. Chem. Ber. 1990, 123, 2395-2401. (c) Thadani, A. N.; Batey, R. A. Tetrahedron Lett. 2003, 44, 8051-8055. (d) The higher stability of Cornforth-like transition structures in some additions of allylboron reagents to $\alpha$-oxygenated aldehydes has also received theoretical support: Gung, B. W.; Xue, X. Tetrahedron: Asymmetry 2001, 12, 2955-2959. (e) For more detailed accounts of the diastereoselective reactions of allylboron compounds, see: Roush, W. R. In Comprehensive Organic Synthesis; Trost, B. M., Fleming, I., Winterfeldt, E., Eds.; Pergamon Press: Oxford, 1993; Vol. 2, pp 1-54. Roush, W. R. In Houben-Weyl's Methods of Organic Chemistry, Stereoselective Synthesis; Helmchen, G., Hoffmann, R. W., Mulzer, J., Schaumann, E., Eds.; Georg Thieme Verlag: Stuttgart, 1996; Vol. 3, pp 1410-1486, and references therein. (13) See pertinent citations in our previous publication. ${ }^{7}$ Because aldehydes $\mathbf{6 c}$ gave essentially the same results as $\mathbf{6 b}$ in aldol reactions with 1 , only the latter were used in the present work.
(14) The stereostructures of the aldol products were established with the aid of the chemical correlation methodology used in our previous papers ${ }^{3}$ and, in two cases, by means of X-ray diffraction analysis. ${ }^{15}$ Aldol adducts were reduced in situ with $\mathrm{LiBH}_{4}$ to yield the expected syn-1,3-diols. ${ }^{16}$ These were subsequently converted into acetonides, which were then studied by means of NMR. ${ }^{17}$ Standard manipulations of the protecting groups further permitted the preparation of other cyclic derivatives suitable for similar NMR studies. Descriptions of these chemical correlations and analytical data for correlation products are given in the Supporting Information.

TABLE 1. Stereochemical outcome of Aldol Additions of Ketone 2 with Aldehydes (R)- and (S)-5

| entry | aldehyde | \% yield | $\mathrm{dr}^{a}$ |
| :---: | :---: | :---: | :---: |
| 1 | $(S)-\mathbf{5 a}$ | 95 | $>95: 5^{b}$ |
| 2 | $(S)-\mathbf{5 b}$ | 75 | $>95: 5^{b}$ |
| 3 | $(R)-\mathbf{5 a}$ | 86 | $>95: 5^{c}$ |
| 4 | $(R)-\mathbf{5 b}$ | 62 | $>95: 5^{c}$ |

${ }^{a} \mathrm{dr}>95: 5$ means that the minor diastereoisomer was not detected by means of ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR. ${ }^{b}$ The only diastereoisomer detected was 10a,b. ${ }^{c}$ The only diastereoisomer detected was 11a,b.

## SCHEME 3. Aldol Additions of the Boron $Z$-Enolate of 2 to Aldehydes (R)-5 and (S)-5

aldehydes $(R)-5$ and (S)-5. The results are shown in Scheme 3 and Table 1. The reactions with aldehydes ( $S$ )-5 were comparatively rapid at $0{ }^{\circ} \mathrm{C}$ (total conversion in 5 h ) and completely diastereoselective, taking into account the detection limits of NMR spectroscopic methods ( $\mathrm{dr}>95: 5$ ). Aldols 10 were thus formed via enolate attack to the $R e$ aldehyde carbonyl face. For aldehydes $(R)-5$, the reactions were also completely diastereoselective and gave rise to aldols 11, again resulting from enolate attack to the $R e$ aldehyde face.
These results lead to the conclusion that the facial bias of this ketone enolate (attack to aldehyde $R$ e faces) is strong enough to overcome the inherent facial Felkin preference of the carbonyl group in $\alpha$-methyl aldehydes $\mathbf{5}$, a fact which greatly enhances the synthetic value of this methodology. ${ }^{6}$ This can be understood within the same mechanistic framework presented in our recent publications. ${ }^{3 c, 7}$ Scheme 4 presents a proposal of favorable cyclic transition structures (TSs) of the ZimmermanTraxler type, ${ }^{18,19}$ in which the different, previously discussed energetically relevant features ${ }^{7}$ are taken into account. In order of increasing quantitative importance, these factors are: (a) the inherent Felkin-Anh bias of the aldehyde (nucleophilic attack anti-coplanar to either the bulkiest aldehyde $\mathrm{C}_{\alpha}$ substituent or that having the

[^2]

Felkin-Anh TS-3

- (crowded dioxolane position)

(syn pentane repulsion)

lowest lying $\sigma^{*} \mathrm{C}-\mathrm{x}$ orbital), including the most favorable Bürgi-Dunitz trajectory (approach nearer to the smallest $\mathrm{C}_{\alpha}$ substituent, usually an H atom); ${ }^{10,20,21}$ (b) anticoplanar orientation of the $\mathrm{C}-\mathrm{O}_{\text {enolate }}$ and $\mathrm{C}_{\alpha}-\mathrm{O}$ bonds (minimized dipolar repulsion $)^{1 \mathrm{e}, 22}$ and the spatial allocation of the dioxolane ring away from the bulky boron ligands (minimized steric crowding); and (c) avoidance of syn pentane repulsive interactions between the Me group at the enolate $\mathrm{C}=\mathrm{C}$ bond and one substituent at the stereogenic $\alpha$-aldehyde carbon. ${ }^{12,12,23,24}$

For the reactions of aldehydes ( $S$ )-5 yielding solely syn aldols $\mathbf{1 0}$, we may assume a TS such as TS-2, which is

[^3]still of the Felkin-Anh-type (enolate attack anti to the bulky $\mathrm{CH}_{2} \mathrm{OP}$ group), but in which the enolate approaches along a less favorable Bürgi-Dunitz trajectory that pushes the nucleophile toward the methyl group rather than to the hydrogen atom, a feature of quantitatively minor importance. ${ }^{7}$ The alternative, and unobserved, attack of the enolate to the aldehyde $S i$ face must take place, under the assumed avoidance of syn pentane interactions, through TS-1, which shows an unfavorable steric crowding between the dioxolane ring and one of the bulky boron ligands. This particular hindrance may be alleviated by means of bond rotation, but only at the cost of increasing the dipolar repulsion between the $\mathrm{C}-\mathrm{O}_{\text {enolate }}$ and $\mathrm{C}_{\alpha}-\mathrm{O}$ bonds. ${ }^{22}$ In contrast, the aldol reaction with aldehydes $(R)-5$ led mainly to the Felkin stereoisomer 11 (Scheme 4). This stereochemical outcome can be explained only if the aldol process occurs via the "non-Anh" rotamer TS-4, ${ }^{21}$ again under avoidance of the syn pentane interaction present in the Felkin-Anh rotamer TS-5. Moreover, enolate attack to the aldehyde $S i$ face to yield the (not detected) epimer of $\mathbf{1 1}$ through

[^4]
## SCHEME 5. Aldol Additions of the Boron $\boldsymbol{Z}$-Enolate of 2 to Aldehydes (R)-6 and (S)-6

TS-3 would suffer from steric crowding between the dioxolane ring and one of the B-cyclohexyl groups.

Aldol Reactions with $\alpha$-Oxygenated Aldehydes. We then investigated the aldol reactions of ketone 2 and $\alpha$-oxygenated aldehydes $(R)-6$ and $(S)-6$. The results are given in Scheme 5. The reactions with aldehydes ( $S$ )-6 were highly diastereoselective and gave aldols 12a,b ( $d r>95: 5$ ), once again through enolate attack to the aldehyde $R e$ face. In contrast, the reactions of aldehydes ( $R$ )-6 were very slow (less than $50 \%$ conversion after 12 h) and not only yielded complex mixtures of $3-4$ stereoisomeric aldols but were also accompanied by extensive decomposition. ${ }^{25}$

These results parallel those previously observed with ketone $\mathbf{1}^{7}$ and may be explained within the same mechanistic framework. Again, the Felkin-Anh model proves unable to provide a satisfactory explanation of this stereochemical outcome, as shown on the left-hand side of Scheme $6 .{ }^{26,27}$ Reasonable explanations may be formulated, however, by invoking the Cornforth model. ${ }^{11,12,28}$ This is illustrated on the right-hand side of Scheme 6, where the proposed transition structures are reexamined within this paradigm. Thus, the unfavorable non-Anh TS-7 now becomes favorable within the framework of the Cornforth model. Dipolar repulsions between the $\mathrm{C}=\mathrm{O}$ and $\mathrm{C}_{\alpha}-\mathrm{OP}$ bonds are minimized in this TS , in which nucleophilic attack takes place from the less hindered carbonyl face. The alternative TS-6 not only deviates from the Cornforth geometry, an unfavorable feature in this case, but also shows a syn pentane repulsion between the two methyl groups. As regards the aldol reactions of $\mathbf{2}$ with aldehydes ( $R$ )-6, a Cornforth transition structure TS-9 may be formulated, but it suffers from steric crowding between the dioxolane ring and the boron

[^5]cyclohexyl ligands. For its part, the Felkin-Anh TS-8 deviates from the Cornforth geometry. The fact that both alternative TSs display energetically unfavorable features explains why the corresponding aldol reaction is slow and nonstereoselective.

All results therefore can be explained within the framework of the same unified general concept we put forth in our recent publication. ${ }^{7}$ Energetic factors in order of decreasing quantitative importance are: (a) for $\alpha$-het-eroatom-substituted aldehydes and in contrast to $\alpha$-methyl aldehydes, Cornforth TSs are markedly preferred to those of the Felkin-Anh type; (b) syn pentane repulsions between the enolate Me group and one aldehyde nonhydrogen $\alpha$-substituent (Me in the lactaldehyde derivatives used here) are energetically important interactions that must be avoided through $\mathrm{C}-\mathrm{C}$ bond rotation; (c) steric crowding between the dioxolane ring and one B-cyclohexyl group arises when attack takes place from the enolate Si face; while suitable $\mathrm{C}-\mathrm{C}$ bond rotation relieves this interaction, it simultaneously increases the dipolar repulsion between the $\mathrm{C}-\mathrm{O}_{\text {enolate }}$ and $\mathrm{C}_{\alpha}-\mathrm{O}$ bonds; and (d) because the Felkin-Anh $\pi$-facial bias is not very strong for aldehydes bearing only carbon $\alpha$-substituents (dr's rarely $\geq 3: 1$ ), ${ }^{1,20}$ stereocontrol is frequently exerted by the chiral enolate rather than by the aldehyde.
In summary, we propose that $\alpha$-methyl aldehydes $(S)$-5 react with the dicyclohexylboron enolate of 2 to yield aldols $\mathbf{1 0}$ selectively through TS-2 whereas aldehydes ( $R$ )-5 generate aldols $\mathbf{1 1}$ through TS-4 (Scheme 4), with stereocontrol coming from the chiral enolate in both cases. The $\alpha$-oxygenated aldehydes ( $S$ )-6, on the other hand, react to yield aldols 12 through the Cornforth transition state TS-7 (Scheme 6). Their enantiomers $(R)-6$ react sluggishly and nonstereoselectively because the energy of the Cornforth-type TS-9 (Scheme 6) is increased by factor c. The energy of the alternative TS-8 is also increased by its deviation from the Cornforth geometry, that is, dominance of factor a. Once again, the Cornforth model proves useful in explaining the stereochemical outcome of aldol additions to $\alpha$-heteroatomsubstituted carbonyl groups. ${ }^{28-30}$

Synthesis of the $\mathbf{C}_{1}-\mathbf{C}_{9}$ Soraphen $A_{1 \alpha}$ Fragment. As noted above, the unprecedented $d^{3}$ and $d^{4}$ synthons depicted in Scheme 1 may be particularly useful for the synthesis of polyhydroxy and polypropionate chains such as those present in bioactive, natural polyketides. To

[^6]
## SCHEME 6. Felkin-Anh and Cornforth TSs for Aldol Additions of the Boron Z-Enolate of 2 to Aldehydes (R)-6 and (S)-6

Felkin-Anh model

illustrate this, we have prepared a fragment of the molecular structure of the antifungal metabolite soraphen $\mathrm{A}_{1 \alpha}$ (Scheme 7). This naturally occurring compound is the main member of a macrolide family isolated from cultures of a strain of the myxobacterium Sorangium cellulosum. It exhibits a marked antifungal activity due to its ability to inhibit the fungal acetyl-CoA carboxylase. ${ }^{31}$ Recent studies have established that the product is basically a polyketide as regards its biosynthetic origin, even though the presence of an unsubstituted phenyl ring also relates it to the shikimic acid pathway. ${ }^{32}$ Only a total synthesis has been reported thus far for soraphen $\mathrm{A}_{1 \alpha},{ }^{33}$ but other synthetic approaches to fragments of its structure or analogues thereof have recently appeared in the literature. ${ }^{34}$

Cornforth model

Our main retrosynthetic concept for soraphen $\mathrm{A}_{1 \alpha}$ is depicted in Scheme 7. The macrolide system is to be constructed by means of a Julia olefination-macrolactonization sequence. This retrosynthetic cleavage gives rise to fragments $\mathbf{A}$ and $\mathbf{B}$, the latter comprising carbon atoms C-1 to C-9. In this paper, we present a stereoselective synthesis of compound $\mathbf{1 3}$ (depicted in Scheme 7 in both the cyclic hemiacetal and the open form), a precursor to fragment B. Functional modification of compound 13 produces intermediate $\mathbf{C}$ (Scheme 8), the disconnection of which via retro-aldol reaction generates $\mathbf{D}$. Compound D in turn is easily available via our aldol methodology from ketone 2 and one of the aldehydes ( $S$ )-5 (depending on the protective group selected), whereby the former product functions as a chiral $\mathrm{d}^{4}$ synthon, thus maximizing atom economy. ${ }^{35}$ The process is highly convergent and leads to compound 13, which has six stereocenters (seven in the hemiacetal form), from two chiral precursors, 2 and ( $S$ )-5, with one stereocenter each.

The specific steps of the synthesis are depicted in Scheme 9. Thus, aldol reaction of 2 with aldehyde ( $S$ )$\mathbf{5 b}$, followed by in situ reduction ${ }^{16}$ with $\mathrm{LiBH}_{4}$, afforded syn-1,3-diol 14 , which was subsequently transformed into its benzylated derivative 15. ${ }^{36}$ Cleavage of the cyclohex-

anone acetal was initially attempted under the usual aqueous acidic conditions, but yields were only moderate. ${ }^{37}$ An excellent $87 \%$ yield was obtained, however, under aprotic conditions with anhydrous $\mathrm{ZnBr}_{2}$ in $\mathrm{CH}_{2}-$ $\mathrm{Cl}_{2} .{ }^{38}$ Diol 16 was selectively silylated in its primary alcohol group and then methylated in the secondary hydroxyl with trimethyloxonium tetrafluoroborate ${ }^{39}$ to

[^8]18. Desilylation of the latter compound with TBAF followed by Swern oxidation ${ }^{40}$ afforded aldehyde 20. The absolute configurations of all five stereocenters present in compounds $\mathbf{1 4 - 2 0}$ were unequivocally established as described in the Supporting Information. ${ }^{14}$ The remaining carbon chain, which comprises two stereocenters, was added with the aid of the asymmetric Evans aldol methodology. ${ }^{41}$ Thus, oxazolidinone 21 was transformed into its boron $Z$-enolate and added to aldehyde 20. This provided adduct 22, which has seven consecutive stereocenters, as an essentially single diastereomer. The configurations of the two new stereocenters were predicted on the basis of the reliable outcome of Evans aldol methodology, aided here in a matched way by the intrinsic Felkin bias of the aldehyde. ${ }^{29 b}, 42$ Reductive cleavage of the chiral auxiliary followed by selective protection and oxidation with Dess-Martin periodinane ${ }^{43}$ afforded ketone 25 in good yield. Ketone 25 was then converted into the targeted intermediate $\mathbf{1 3},{ }^{44}$ precursor to one of the key fragments of soraphen $\mathrm{A}_{1 \alpha}$.

## Experimental Section

General Features. These are described in detail in the Supporting Information.
General Experimental Procedure for Aldol Additions of Ketone 2 Mediated by Dicyclohexyl Boron Chloride. $\mathrm{Chx}_{2} \mathrm{BCl}$ (neat, $395 \mu \mathrm{~L}$, ca. 1.8 mmol ) was added under $\mathrm{N}_{2}$ via syringe to an ice-cooled solution of $\mathrm{Et}_{3} \mathrm{~N}(280 \mu \mathrm{~L}, 2 \mathrm{mmol})$ in anhydrous $\mathrm{Et}_{2} \mathrm{O}$ ( 5 mL ). Ketone $2(198 \mathrm{mg}, 1 \mathrm{mmol}$ ) was dissolved in anhydrous ether ( 5 mL ) and added dropwise via syringe to the reagent solution. The reaction mixture was then stirred for 30 min . After addition of a solution of the appropriate aldehyde ( 1.5 mmol ) in ether ( 6 mL ), the reaction mixture was stirred at $0^{\circ} \mathrm{C}$ for 5 h . Phosphate buffer solution ( $\mathrm{pH} 7,6$ $\mathrm{mL})$ and $\mathrm{MeOH}(6 \mathrm{~mL})$ were then added, followed by $30 \% \mathrm{aq}$ $\mathrm{H}_{2} \mathrm{O}_{2}$ solution ( 3 mL ). After being stirred for 1 h at room temperature, the mixture was worked up (extraction with $\mathrm{Et}_{2} \mathrm{O}$ ). Solvent removal in vacuo and column chromatography of the residue on silica gel (hexanes-EtOAc mixtures) afforded the corresponding aldol addition product. Chemical yields and dr's (the latter determined by means of ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR) are given in the text.

## SCHEME 9. Stereoselective Synthesis of Intermediate 13

(2R,3S,4S)-5-(tert-Butyldiphenylsilyloxy)-1-[(2S)-(1,4-dioxaspiro[4.5]dec-2-yl)]-3-hydroxy-2,4-dimethylpentan-1-one (10a). Oil, $[\alpha]_{\mathrm{D}}-36.5$ (c 1.4; $\mathrm{CHCl}_{3}$ ). IR 3490 (br), 1715 $\mathrm{cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( 500 MHz ) $\delta 7.70-7.65(4 \mathrm{H}, \mathrm{br} \mathrm{m}), 7.45-7.35$ $(6 \mathrm{H}, \mathrm{br} \mathrm{m}), 4.64(1 \mathrm{H}, \mathrm{dd}, J=7.7,5.7 \mathrm{~Hz}), 4.24(1 \mathrm{H}, \mathrm{dt}, J=$ $8.8,3 \mathrm{~Hz}), 4.20(1 \mathrm{H}, \mathrm{dd}, J=8.5,7.7 \mathrm{~Hz}), 4.10(1 \mathrm{H}, \mathrm{dd}, J=$ $8.5,5.7 \mathrm{~Hz}), 3.84(1 \mathrm{H}, \mathrm{dd}, J=10.2,4 \mathrm{~Hz}), 3.74(1 \mathrm{H}, \mathrm{dd}, J=$ $10.2,7.2 \mathrm{~Hz}), 3.60(1 \mathrm{H}$, br d, $J=3 \mathrm{~Hz}, \mathrm{OH}), 3.27(1 \mathrm{H}, \mathrm{dq}, J=$ $3,7 \mathrm{~Hz}), 1.84(1 \mathrm{H}, \mathrm{m}), 1.65-1.55(8 \mathrm{H}, \mathrm{br} \mathrm{m}), 1.40(2 \mathrm{H}, \mathrm{m})$, $1.10(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}), 1.07(9 \mathrm{H}, \mathrm{s}), 0.87(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR ( 125 MHz ) $\delta 212.8,132.9,132.8,111.3,19.1$ (C), 135.6, $135.5,129.9,129.8,127.7,127.6,79.1,74.7,45.1,37.7$ (CH), $68.8,66.3,35.8,34.6,25.1,24.0,23.8\left(\mathrm{CH}_{2}\right), 26.9(\times 3), 13.4$, $7.5\left(\mathrm{CH}_{3}\right)$. HR FABMS $m / z 525.3043\left(\mathrm{M}+\mathrm{H}^{+}\right)$. Calcd for $\mathrm{C}_{31} \mathrm{H}_{45} \mathrm{O}_{5} \mathrm{Si}$, 525.3036. Anal. Calcd for $\mathrm{C}_{31} \mathrm{H}_{44} \mathrm{O}_{5} \mathrm{Si}: \mathrm{C}, 70.95$; H, 8.45. Found: C, 70.80; H, 8.49.
(2R,3S,4S)-5-Benzyloxy-1-[(2S)-(1,4-dioxaspiro[4.5]dec-2-yl)]-3-hydroxy-2,4-dimethylpentan-1-one (10b). Oil; [ $\alpha]_{D}$ -42.6 (c 1.5; $\mathrm{CHCl}_{3}$ ). IR 3480 (br), $1718 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR (500 $\mathrm{MHz}) \delta 7.35-7.25(5 \mathrm{H}, \mathrm{br} \mathrm{m}), 4.59(1 \mathrm{H}, \mathrm{dd}, J=8,5.5 \mathrm{~Hz})$, $4.52,4.49(2 \mathrm{H}, \mathrm{AB}$ system, $J=11.7 \mathrm{~Hz}), 4.16(1 \mathrm{H}, \mathrm{t}, J=8$ Hz ), $4.10(1 \mathrm{H}$, br dd, $J=8.5,3 \mathrm{~Hz}), 4.05(1 \mathrm{H}, \mathrm{dd}, J=8,5.5$ $\mathrm{Hz}), 3.62(1 \mathrm{H}, \mathrm{dd}, J=9,4 \mathrm{~Hz}), 3.55-3.50(2 \mathrm{H}, \mathrm{m}), 3.25(1 \mathrm{H}$, $\mathrm{dq}, J=3.5,7 \mathrm{~Hz}$ ), $1.94(1 \mathrm{H}, \mathrm{m}), 1.65-1.50(8 \mathrm{H}, \mathrm{br} \mathrm{m}), 1.40$ $(2 \mathrm{H}, \mathrm{m}), 1.05(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}), 0.92(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR ( 125 MHz ) $\delta 212.8,137.7,111.4$ (C), 128.5, 127.9, 127.7, $79.1,75.2,45.1,36.1$ (CH), 75.5, 73.6, 66.3, 35.8, 34.6, 25.1, 24.0, $23.9\left(\mathrm{CH}_{2}\right), 13.7,7.8\left(\mathrm{CH}_{3}\right)$ HR EIMS m/z (rel int.) $376.2227\left(\mathrm{M}^{+}, 1\right), 198$ (12), 141 (50), 91 (100). Calcd for $\mathrm{C}_{22} \mathrm{H}_{32} \mathrm{O}_{5}, 376.2249$. Anal. Calcd for $\mathrm{C}_{22} \mathrm{H}_{32} \mathrm{O}_{5}: \mathrm{C}, 70.18 ; \mathrm{H}$, 8.57. Found: C, 70.09; H, 8.70.
(1S,2R,3S,4S)-5-Benzyloxy-1-[(2S)-1,4-dioxaspiro[4.5]-dec-2-yl]-2,4-dimethylpentane-1,3-diol (14). $\mathrm{Chx}_{2} \mathrm{BCl}$ (neat, 4 mL , ca. 18 mmol ) was added under $\mathrm{N}_{2}$ via syringe to an icecooled solution of $\mathrm{Et}_{3} \mathrm{~N}(2.8 \mathrm{~mL}, 20 \mathrm{mmol})$ in anhydrous $\mathrm{Et}_{2} \mathrm{O}$
( 50 mL ). Ketone $2(1.98 \mathrm{~g}, 10 \mathrm{mmol}$ ) was dissolved in anhydrous ether ( 50 mL ) and added dropwise via syringe to the reagent solution. The reaction mixture was then stirred for 30 min . After addition of a solution of freshly prepared aldehyde ( $S$ )-5b ( $2.67 \mathrm{~g}, 15 \mathrm{mmol}$ ) in ether ( 60 mL ), the reaction mixture was stirred at $0^{\circ} \mathrm{C}$ for 5 h . The solution was cooled to $-78^{\circ} \mathrm{C}$ and treated dropwise with a 2 M solution of $\mathrm{LiBH}_{4}$ in THF ( $15 \mathrm{~mL}, 30 \mathrm{mmol}$ ). The stirring was then continued at $-78{ }^{\circ} \mathrm{C}$ for 2 h . The reaction was quenched with pH 7 phosphate buffer ( 60 mL ) and $\mathrm{MeOH}(60 \mathrm{~mL})$, followed by a $30 \%$ aq $\mathrm{H}_{2} \mathrm{O}_{2}$ solution ( 30 mL ). After being stirred for 1 h at room temperature, the mixture was poured into saturated aq $\mathrm{NaHCO}_{3}$ and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The organic layer was washed with brine and dried on anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Solvent removal in vacuo afforded an oily residue, which was chromatographed on silica gel (hexanes-EtOAc mixtures) to yield syn-1,3-diol 14 ( $2.8 \mathrm{~g}, 74 \%$ overall): oil; $[\alpha]_{\mathrm{D}}+15.8$ (с 3.1, $\mathrm{CHCl}_{3}$ ); IR $3470(\mathrm{br}) \mathrm{cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR $\delta 7.35-7.25(5 \mathrm{H}, \mathrm{br} \mathrm{m})$, $4.52(2 \mathrm{H}, \mathrm{s}), 4.20(1 \mathrm{H}, \mathrm{dt}, J=8,6 \mathrm{~Hz}), 4.00(1 \mathrm{H}, \mathrm{dd}, J=8,6$ $\mathrm{Hz}), 3.70(3 \mathrm{H}, \mathrm{m}), 3.57(1 \mathrm{H}, \mathrm{dd}, J=10,5 \mathrm{~Hz}), 3.54(1 \mathrm{H}$, dd, $J=10,7 \mathrm{~Hz}), 3.10(2 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{OH}), 1.96(1 \mathrm{H}, \mathrm{m}), 1.65-1.55$ $(9 \mathrm{H}, \mathrm{br}$ m) $, 1.40(2 \mathrm{H}, \mathrm{m}), 0.97(3 \mathrm{H}, \mathrm{d}, J=6.5 \mathrm{~Hz}), 0.81(3 \mathrm{H}, \mathrm{d}$, $J=6.5 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR $\delta 137.9$, 110.1 (C), 128.5, 127.8, 127.7, $79.3,76.9,76.7,37.3,36.0(\mathrm{CH}), 75.5,73.5,65.9,36.4,35.1$, 25.2, 24.1, $23.9\left(\mathrm{CH}_{2}\right), 13.5,6.3\left(\mathrm{CH}_{3}\right)$. HR EIMS $\mathrm{m} / \mathrm{z}$ (rel int.) $378.2350\left(\mathrm{M}^{+}, 1\right), 141(20), 91$ (100). Calcd for $\mathrm{C}_{22} \mathrm{H}_{34} \mathrm{O}_{5}$, 378.2406 .
(2S)-2-[(1S,2R,3S,4S)-1,3,5-Tris(benzyloxy)-2,4-dimeth-ylpentyl]-1,4-dioxaspiro[4.5]decane (15). A $30 \%$ commercial suspension of potassium hydride in mineral oil ( 3.2 g , equivalent to ca. 24 mmol of KH ) was stirred under $\mathrm{N}_{2}$ with dry hexane ( 20 mL ). The suspension was decanted, and the supernatant liquid was removed with a syringe. This operation was repeated once more with dry hexane and then again with dry THF. After addition of dry THF ( 20 mL ), the flask was
cooled in an ice bath. A solution of diol $\mathbf{1 4}(2.27 \mathrm{~g}, 6 \mathrm{mmol})$ in dry THF ( 20 mL ) was then added via syringe and stirred for 30 min at the same temperature. Benzyl bromide ( 5.7 mL , ca. 48 mmol , 8 equiv) and tetra- $n$-butylammonium iodide ( 185 mg , 0.5 mmol ) were then added to the reaction mixture, which was stirred for 2 h at room temperature. Workup (extraction with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) and column chromatography on silica gel (hexanes$\mathrm{Et}_{2} \mathrm{O}$, 19:1) furnished 15 ( $3.11 \mathrm{~g}, 93 \%$ ): oil; $[\alpha]_{\mathrm{D}}-11.1$ (c 1.8, $\left.\mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H}$ NMR $\delta 7.40-7.25$ ( $15 \mathrm{H}, \mathrm{br} \mathrm{m}$ ), $4.82(1 \mathrm{H}, \mathrm{d}, J=12$ $\mathrm{Hz}), 4.63(1 \mathrm{H}, \mathrm{d}, J=12 \mathrm{~Hz}), 4.58(2 \mathrm{H}, \mathrm{AB}$ system, $J=11.5$ $\mathrm{Hz}), 4.44(2 \mathrm{H}, \mathrm{s}), 4.28(1 \mathrm{H}, \mathrm{m}), 3.87(1 \mathrm{H}, \mathrm{dd}, J=8,6 \mathrm{~Hz}), 3.58$ ( $1 \mathrm{H}, \mathrm{dd}, J=9,5.5 \mathrm{~Hz}$ ), 3.50 ( $1 \mathrm{H}, \mathrm{dd}, J=7.3,3 \mathrm{~Hz}$ ), $3.45-$ $3.40(2 \mathrm{H}, \mathrm{m}), 3.34(1 \mathrm{H}, \mathrm{dd}, J=9,6.3 \mathrm{~Hz}), 2.00(1 \mathrm{H}, \mathrm{m}), 1.83$ $(1 \mathrm{H}, \mathrm{m}), 1.65-1.25(10 \mathrm{H}, \mathrm{br} \mathrm{m}), 1.05(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}), 0.99$ $(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR $\delta 139.2,139.1,138.6,109.8$ (C), 128.3, 128.2, 128.1, 127.7, 127.5, 127.4, 83.9, 80.8, 79.0, 38.7, 36.2 (CH), 75.2, 73.5, 73.1, 72.0, 65.9, 36.5, 35.5, 25.3, 24.1, $24.0\left(\mathrm{CH}_{2}\right), 16.2,10.7\left(\mathrm{CH}_{3}\right)$. HR EIMS $\mathrm{m} / \mathrm{z}$ (rel int.) 558.3380 $\left(\mathrm{M}^{+}, 1\right), 309$ (10), 269 (16), 181 (42), 91 (100). Calcd for $\mathrm{C}_{36} \mathrm{H}_{46} \mathrm{O}_{5}, 558.3345$.
(2S,3S,4R,5S,6S)-3,5,7-Tris(benzyloxy)-4,6-dimethyl-heptane-1,2-diol (16). Anhydrous $\mathrm{ZnBr}_{2}(6.75 \mathrm{~g}, 30 \mathrm{mmol})$ was added under $\mathrm{N}_{2}$ to a solution of acetal 15 ( 2.8 g , ca. 5 $\mathrm{mmol})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(60 \mathrm{~mL})$. The mixture was stirred at room temperature until consumption of the starting material (ca. 3 h, TLC monitoring!). Workup (extraction with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) and column chromatography on silica gel (hexanes-EtOAc, 7:3) provided diol $16(2.08 \mathrm{~g}, 87 \%)$ : oil; $[\alpha]_{\mathrm{D}}+7.7\left(c 1.8, \mathrm{CHCl}_{3}\right)$; IR 3440 (br) cm ${ }^{-1}$; ${ }^{1} \mathrm{H}$ NMR $\delta 7.40-7.25$ ( 15 H , br m), 4.67 ( 1 H , $\mathrm{d}, J=11.5 \mathrm{~Hz}), 4.63(1 \mathrm{H}, \mathrm{d}, J=11.5 \mathrm{~Hz}), 4.60-4.55(4 \mathrm{H}, \mathrm{m})$, $3.80(1 \mathrm{H}, \mathrm{m}), 3.65(1 \mathrm{H}, \mathrm{dd}, J=9,5 \mathrm{~Hz}), 3.60-3.55(3 \mathrm{H}, \mathrm{m})$, $3.53(1 \mathrm{H}, \mathrm{dd}, J=11.5,4.5 \mathrm{~Hz}), 3.48(1 \mathrm{H}, \mathrm{dd}, J=7,4 \mathrm{~Hz})$, $2.80(1 \mathrm{H}, \mathrm{br}$ s, OH$), 2.30(1 \mathrm{H}, \mathrm{br}$ s, OH$), 2.25(2 \mathrm{H}, \mathrm{m}), 1.14$ $(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}), 1.09(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR $\delta 138.9$, 138.4, 138.1 (C), 128.3, 128.2, 128.1, 127.7, 127.5, 127.4, 81.2, 80.8, 72.3, 37.4, $36.6(\mathrm{CH}), 74.5,74.0,73.2,72.4,64.5\left(\mathrm{CH}_{2}\right)$, 15.0, $10.4\left(\mathrm{CH}_{3}\right)$. HR FAB MS m/z $479.2824(\mathrm{M}+\mathrm{H})^{+}$. Calcd for $\mathrm{C}_{30} \mathrm{H}_{39} \mathrm{O}_{5}, 479.2797$.
(2S,3S,4R,5S,6S)-3,5,7-Tris(benzyloxy)-1-(tert-butyldi-phenylsilyloxy)-4,6-dimethylheptan-2-ol (17). A solution of alcohol $16(1.92 \mathrm{~g}$, ca. 4 mmol$)$ and imidazole ( $680 \mathrm{mg}, 10$ $\mathrm{mmol})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{~mL})$ was treated dropwise under $\mathrm{N}_{2}$ with a solution of TPS chloride ( $1.55 \mathrm{~g}, 6 \mathrm{mmol}$ ) in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ $(10 \mathrm{~mL})$. The reaction mixture was stirred overnight at rt , then diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and worked up. Column chromatography on silica gel (hexanes-EtOAc, 9:1) afforded 17 ( $2.72 \mathrm{~g}, 95 \%$ ): oil; $[\alpha]_{\mathrm{D}}-9.6$ (c 2.1, $\mathrm{CHCl}_{3}$ ); IR 3500 (br) $\mathrm{cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\delta$ $7.75-7.70(4 \mathrm{H}, \mathrm{m}), 7.45-7.25(21 \mathrm{H}, \mathrm{br} \mathrm{m}), 4.71(1 \mathrm{H}, \mathrm{d}, J=$ $11.5 \mathrm{~Hz}), 4.66-4.58(3 \mathrm{H}, \mathrm{m}), 4.55(2 \mathrm{H}, \mathrm{AB}$ system, $J=12 \mathrm{~Hz})$, $4.05(1 \mathrm{H}, \mathrm{m}), 3.81(1 \mathrm{H}, \mathrm{dd}, J=10,6.5 \mathrm{~Hz}), 3.75-3.70(2 \mathrm{H}$, m), $3.65-3.60(3 \mathrm{H}, \mathrm{m}), 2.60(1 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}, \mathrm{OH}), 2.32(1 \mathrm{H}$, m), $2.23(1 \mathrm{H}, \mathrm{m}), 1.19(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}), 1.16(9 \mathrm{H}, \mathrm{s}), 1.13$ $(3 \mathrm{H}, \mathrm{d}, J=6.5 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR $\delta$ 139.1, 138.7, 138.4, 133.3, 133.2, 19.2 (C), 135.6, 135.5, 129.7, 128.3, 128.2, 128.1, 127.7, $127.5,127.4,127.2,81.1,80.0,72.0,37.2,37.0$ (CH), 74.6, 74.0, 73.1, $72.5,65.2\left(\mathrm{CH}_{2}\right), 26.9(\times 3), 15.0,10.5\left(\mathrm{CH}_{3}\right)$. HR FAB MS $\mathrm{m} / z 717.3998(\mathrm{M}+\mathrm{H})^{+}$. Calcd for $\mathrm{C}_{46} \mathrm{H}_{57} \mathrm{O}_{5} \mathrm{Si}$, 717.3970.
(2S,3S,4R,5S,6S)-3,5,7-Tris(benzyloxy)-1-(tert-butyldi-phenylsilyloxy)-2-methoxy-4,6-dimethylheptane (18). Alcohol 17 ( 2.15 g , ca. 3 mmol ) and 1,8-bis( $N, N$-dimethylamino)naphthalene ( 3.9 g , ca. 18 mmol ) were dissolved under $\mathrm{N}_{2}$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50 \mathrm{~mL})$ and treated with trimethyloxonium tetrafluoroborate ( 2.22 g , ca. 15 mmol ). The solution was stirred for 3 h at rt. Workup (extraction with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) and column chromatography on silica gel (hexanes-EtOAc, 19:1) yielded methyl ether 18 ( $1.95 \mathrm{~g}, 89 \%$ ): oil; $[\alpha]_{\mathrm{D}}-17.3$ (c 1.5, $\left.\mathrm{CHCl}_{3}\right)$; ${ }^{1} \mathrm{H}$ NMR $\delta 7.75-7.70(4 \mathrm{H}, \mathrm{m}), 7.45-7.30(21 \mathrm{H}$, br m), $4.72(1 \mathrm{H}, \mathrm{d}, J=11.3 \mathrm{~Hz}), 4.66(2 \mathrm{H}, \mathrm{d}, J=11.3 \mathrm{~Hz}), 4.60(1 \mathrm{H}$, d, $J=11.3 \mathrm{~Hz}), 4.52(2 \mathrm{H}, \mathrm{AB}$ system, $J=12 \mathrm{~Hz}), 3.91(1 \mathrm{H}$, dd, $J=10.5,6 \mathrm{~Hz}$ ), $3.87(1 \mathrm{H}, \mathrm{dd}, J=10.5,5.7 \mathrm{~Hz}), 3.71(1 \mathrm{H}$, dd, $J=7.4,4 \mathrm{~Hz}), 3.65-3.60(3 \mathrm{H}, \mathrm{m}), 3.52(1 \mathrm{H}, \mathrm{dd}, J=7.4$, $3.4 \mathrm{~Hz}), 3.49(3 \mathrm{H}, \mathrm{s}), 2.30(1 \mathrm{H}, \mathrm{m}), 2.18(1 \mathrm{H}, \mathrm{m}), 1.16(3 \mathrm{H}, \mathrm{d}$,
$J=7 \mathrm{~Hz}), 1.13(9 \mathrm{H}, \mathrm{s}), 1.08(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR $\delta$ 139.2, 138.8, 138.7, 133.4, 133.3, 19.2 (C), 135.6, 135.5, 129.7, $128.3,128.2,128.1,127.7,127.5,127.4,127.2,83.0,82.0,80.5$, $37.2,37.1(\mathrm{CH}), 74.7,74.3,73.0,72.4,63.3\left(\mathrm{CH}_{2}\right), 59.2,26.9$ $(\times 3), 15.4,10.3\left(\mathrm{CH}_{3}\right)$. Calcd for $\mathrm{C}_{47} \mathrm{H}_{58} \mathrm{O}_{5} \mathrm{Si}, 730.4053$.
(2S,3S,4R,5S,6S)-3,5,7-Tris(benzyloxy)-2-methoxy-4,6-dimethylheptan-1-ol (19). Compound 18 ( 1.83 g , ca. 2.5 mmol ) was dissolved under $\mathrm{N}_{2}$ in dry THF ( 9 mL ). Tetra- $n$ butylammonium fluoride trihydrate (TBAF, $788 \mathrm{mg}, 3 \mathrm{mmol}$ ) dissolved in dry THF ( 3 mL ) was then added. The reaction mixture was stirred at rt until consumption of the starting material (TLC monitoring). After addition of an aq saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 5 mL ), the mixture was stirred for 5 min , worked up, and chromatographed on silica gel (hexanesEtOAc mixtures). This furnished 19 ( $1.05 \mathrm{~g}, 85 \%$ ): oil; $[\alpha]_{\mathrm{D}}$ -2.7 (c 3.3, $\mathrm{CHCl}_{3}$ ); IR 3450 (br) $\mathrm{cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR $\delta 7.40-7.30$ ( $15 \mathrm{H}, \mathrm{br} \mathrm{m}$ ), $4.82(1 \mathrm{H}, \mathrm{d}, J=11.5 \mathrm{~Hz}), 4.66(1 \mathrm{H}, \mathrm{d}, J=11.5$ $\mathrm{Hz}), 4.62(2 \mathrm{H}, \mathrm{AB}$ system, $J=11.5 \mathrm{~Hz}), 4.55(2 \mathrm{H}, \mathrm{AB}$ system, $J=12 \mathrm{~Hz}), 3.76(1 \mathrm{H}, \mathrm{dd}, J=12,4 \mathrm{~Hz}), 3.69(2 \mathrm{H}, \mathrm{m}), 3.59$ $(1 \mathrm{H}, \mathrm{dd}, J=12,5 \mathrm{~Hz}), 3.50(3 \mathrm{H}, \mathrm{s}), 3.50-3.45(3 \mathrm{H}, \mathrm{m}), 2.30$ ( $1 \mathrm{H}, \mathrm{br}$ s, OH ), $2.20(2 \mathrm{H}, \mathrm{m}), 1.16(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}), 1.05(3 \mathrm{H}$, d, $J=7 \mathrm{~Hz}$ ); ${ }^{13} \mathrm{C}$ NMR $\delta$ 139.1, 138.8, 138.4 (C), 128.3, 128.2, 128.1, 127.7, 127.5, 127.4, 127.2, 83.3, 82.8, 80.2, 37.4, 36.5 $(\mathrm{CH}), 74.5,74.3,72.9,72.0,61.1\left(\mathrm{CH}_{2}\right), 58.4,15.6,10.2\left(\mathrm{CH}_{3}\right)$. HR FAB MS m/z $493.2919(\mathrm{M}+\mathrm{H})^{+}$. Calcd for $\mathrm{C}_{31} \mathrm{H}_{41} \mathrm{O}_{5}$, 493.2948.

Oxidation of Alcohol 19 to Aldehyde 20. DMSO ( $350 \mu \mathrm{~L}$, $5 \mathrm{mmol})$ was dissolved under $\mathrm{N}_{2}$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$, cooled to $-78^{\circ} \mathrm{C}$, and treated with oxalyl chloride ( $330 \mu \mathrm{~L}, 2.5 \mathrm{mmol}$ ). After the mixture was stirred at this temperature for 15 min , a solution of alcohol $19(985 \mathrm{mg}, 2 \mathrm{mmol})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10$ mL ) was added dropwise. The stirring was continued by further 15 min , followed by addition of triethylamine ( 1.4 mL , $10 \mathrm{mmol})$. The reaction mixture was then heated to $0^{\circ} \mathrm{C}$ and stirred for 15 min at this temperature. Workup $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ and evaporation in vacuo provided 20 as an oily product, which was directly used in the next step. For weight calculations in the next step, the oxidation is assumed to be quantitative.

Oxazolidinone 22. A solution of $21(466 \mathrm{mg}, 2 \mathrm{mmol})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{~mL})$ was cooled to $-78^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ and treated successively with triethylamine ( $560 \mu \mathrm{~L}, 4 \mathrm{mmol}$ ) and di-nbutylboron triflate ( 3.6 mL of a 1 M solution in $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 3.6$ $\mathrm{mmol}, 1.8$ equiv). The mixture was stirred for 30 min at the same temperature, then for 1 h at $0^{\circ} \mathrm{C}$, and recooled to -78 ${ }^{\circ} \mathrm{C}$. The crude aldehyde 20 from above was dissolved in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ and added dropwise at $-78{ }^{\circ} \mathrm{C}$ to the boron enolate mixture. The reaction was then heated to $-20^{\circ} \mathrm{C}$ and stirred for 14 h at this temperature. The reaction was quenched through sequential addition of pH 7 buffer solution $(15 \mathrm{~mL}), \mathrm{MeOH}(15 \mathrm{~mL})$, and $30 \%$ aqueous $\mathrm{H}_{2} \mathrm{O}_{2}(8 \mathrm{~mL})$, followed by stirring for 30 min at room temperature. The reaction mixture was subsequently worked up (extraction with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) and chromatographed on silica gel (hexanes-EtOAc, $4: 1)$ to yield compound $22(1.11 \mathrm{~g}, 77 \%$ overall yield from 19): oil; $[\alpha]_{\mathrm{D}}+8.1$ (c 1.2, $\mathrm{CHCl}_{3}$ ); IR 3490 (br), 1781, $1694 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\delta 7.40-7.25(20 \mathrm{H}, \mathrm{br} \mathrm{m}), 4.72(1 \mathrm{H}, \mathrm{d}, J=11.3 \mathrm{~Hz}), 4.66$ $(1 \mathrm{H}, \mathrm{d}, J=11.3 \mathrm{~Hz}), 4.65-4.50(5 \mathrm{H}, \mathrm{m}), 4.24(1 \mathrm{H}, \mathrm{m}), 4.13$ $(1 \mathrm{H}, \mathrm{dd}, J=9,2.7 \mathrm{~Hz}), 4.05(2 \mathrm{H}, \mathrm{m}), 3.92(1 \mathrm{H}, \mathrm{dd}, J=7.7,2.8$ $\mathrm{Hz}), 3.61(2 \mathrm{H}, \mathrm{m}), 3.51(1 \mathrm{H}, \mathrm{dd}, J=7.8,2.8 \mathrm{~Hz}), 3.47(1 \mathrm{H}$, overlapped m), $3.46(3 \mathrm{H}, \mathrm{s}), 3.30(1 \mathrm{H}, \mathrm{br}$ s, OH ), $3.25(1 \mathrm{H}$, dd, $J=13.5,3.5 \mathrm{~Hz}), 2.80(1 \mathrm{H}, \mathrm{dd}, J=13.3,9.5 \mathrm{~Hz}), 2.40(1 \mathrm{H}$, m), $2.14(1 \mathrm{H}, \mathrm{m}), 1.37(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}), 1.19(3 \mathrm{H}, \mathrm{d}, J=7$ $\mathrm{Hz}), 1.10(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR $\delta 177.1,152.8,139.2$, $138.8,138.4,135.2$ (C), 129.4, 128.9, 128.3, 128.2, 128.1, 127.7, $127.5,127.4,127.3,81.8,81.0,80.0,71.0,55.0,39.6,37.4,37.2$ (CH), 74.5, 74.1, 73.0, 72.6, 66.0, $37.8\left(\mathrm{CH}_{2}\right), 59.6,15.3,12.1$, $10.1\left(\mathrm{CH}_{3}\right)$. HR FAB MS m/z $724.3770(\mathrm{M}+\mathrm{H})^{+}$. Calcd for $\mathrm{C}_{44} \mathrm{H}_{54} \mathrm{NO}_{8}, 724.3849$.

Alcohol 23. A solution of $\mathrm{LiBH}_{4}(2 \mathrm{M}$ in THF, $0.9 \mathrm{~mL}, 1.8$ mmol ) was cooled under $\mathrm{N}_{2}$ to $-10{ }^{\circ} \mathrm{C}$ and treated with
absolute $\mathrm{EtOH}(105 \mu \mathrm{~L}, 1.8 \mathrm{mmol})$. After the mixture was stirred for 10 min at this temperature, a solution of compound $22(1.08 \mathrm{~g}$, ca. 1.5 mmol$)$ in dry $\mathrm{Et}_{2} \mathrm{O}(20 \mathrm{~mL})$ was added dropwise via syringe, followed by stirring for 2 h at $-10^{\circ} \mathrm{C}$. The reaction was quenched through addition of 1 M NaOH (4 mL ), with continued stirring for further 15 min at $0{ }^{\circ} \mathrm{C}$. Workup (extraction with $\mathrm{Et}_{2} \mathrm{O}$ ) and column chromatography on silica gel (hexanes-EtOAc, 4:1) furnished compound 23 ( $735 \mathrm{mg}, 89 \%$ ): oil; $[\alpha]_{\mathrm{D}}-27.2$ (c 2.6, $\mathrm{CHCl}_{3}$ ); IR 3430 (br) $\mathrm{cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR $\delta 7.40-7.30(15 \mathrm{H}, \mathrm{m}), 4.70(1 \mathrm{H}, \mathrm{d}, J=11.5 \mathrm{~Hz}), 4.66$ $(1 \mathrm{H}, \mathrm{d}, J=11.5 \mathrm{~Hz}), 4.61(1 \mathrm{H}, \mathrm{d}, J=11.5 \mathrm{~Hz}), 4.58(1 \mathrm{H}, \mathrm{d}$, $J=11.5 \mathrm{~Hz}), 4.55(2 \mathrm{H}, \mathrm{s}), 4.04(1 \mathrm{H}, \mathrm{dd}, J=9,1.7 \mathrm{~Hz}), 3.88$ $(1 \mathrm{H}, \mathrm{dd}, J=6.6,3.4 \mathrm{~Hz}), 3.73(1 \mathrm{H}, \mathrm{dd}, J=10.6,4 \mathrm{~Hz}), 3.66$ $(2 \mathrm{H}, \mathrm{m}), 3.57(2 \mathrm{H}, \mathrm{m}), 3.43(3 \mathrm{H}, \mathrm{s}), 3.41(1 \mathrm{H}, \mathrm{dd}, ~ J=9,3.4$ $\mathrm{Hz}), 3.30(1 \mathrm{H}$, br s, OH$), 2.70(1 \mathrm{H}$, br $\mathrm{s}, \mathrm{OH}), 2.38(1 \mathrm{H}, \mathrm{m})$, $2.16(1 \mathrm{H}, \mathrm{m}), 2.00(1 \mathrm{H}, \mathrm{m}), 1.20(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}), 1.09(3 \mathrm{H}, \mathrm{d}$, $J=7 \mathrm{~Hz}), 1.03(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR $\delta 139.2,138.5$, 138.1 (C), 128.3, 128.2, 128.1, 127.7, 127.5, 127.4, 127.2, 82.1, $80.3,79.7,73.1,37.0,36.8,35.5(\mathrm{CH}), 73.9,73.8,73.0,72.5$, $67.6\left(\mathrm{CH}_{2}\right), 59.4,15.4,10.1,9.6\left(\mathrm{CH}_{3}\right)$. HR FAB MS m/z $551.3405(\mathrm{M}+\mathrm{H})^{+}$. Calcd for $\mathrm{C}_{34} \mathrm{H}_{47} \mathrm{O}_{6}, 551.3372$.

Alcohol 24. This was obtained in $89 \%$ yield through silylation of 23 under the conditions described above for 17: oil; $[\alpha]_{\mathrm{D}}-24\left(c 2, \mathrm{CHCl}_{3}\right)$; IR $3500(\mathrm{br}) \mathrm{cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\delta 7.75-$ $7.70(4 \mathrm{H}, \mathrm{m}), 7.50-7.30(21 \mathrm{H}, \mathrm{br} \mathrm{m}), 4.82(1 \mathrm{H}, \mathrm{d}, J=11.6$ $\mathrm{Hz}), 4.71(1 \mathrm{H}, \mathrm{d}, J=11.6 \mathrm{~Hz}), 4.69(1 \mathrm{H}, \mathrm{d}, J=11.4 \mathrm{~Hz}), 4.60$ $(1 \mathrm{H}, \mathrm{d}, J=11.4 \mathrm{~Hz}), 4.56(2 \mathrm{H}, \mathrm{br} \mathrm{s}), 4.23(1 \mathrm{H}, \mathrm{br} \mathrm{d}, J=8.8$ $\mathrm{Hz}), 3.98(1 \mathrm{H}, \mathrm{dd}, J=7.4,2.8 \mathrm{~Hz}), 3.85-3.80(2 \mathrm{H}, \mathrm{m}), 3.68$ $(1 \mathrm{H}, \mathrm{dd}, J=8.8,3.8 \mathrm{~Hz}), 3.64(1 \mathrm{H}, \mathrm{dd}, J=8.8,5.8 \mathrm{~Hz}), 3.60$ $(1 \mathrm{H}, \mathrm{dd}, J=7.7,3.1 \mathrm{~Hz}), 3.50(1 \mathrm{H}$, overlapped m$), 3.50(3 \mathrm{H}$, s), $3.10(1 \mathrm{H}, \mathrm{br}$ s, OH$), 2.42(1 \mathrm{H}, \mathrm{m}), 2.20(1 \mathrm{H}, \mathrm{m}), 2.10(1 \mathrm{H}$, $\mathrm{m}), 1.23(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}), 1.15(9 \mathrm{H}, \mathrm{s}), 1.12(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz})$, $1.10(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR $\delta 139.3,138.7,138.6,133.3$, 133.2, 19.2 (C), 135.6, 135.5, 129.7, 128.3, 128.2, 128.1, 128.0, $127.8,127.5,127.4,127.3,127.2,127.1,82.1,80.8,80.0,72.2$, $37.3,37.2,35.6(\mathrm{CH}), 74.4,74.2,73.0,72.6,69.1\left(\mathrm{CH}_{2}\right), 59.7$, $26.9(\times 3), 15.3,10.0,9.8\left(\mathrm{CH}_{3}\right)$. HR FAB MS $m / z 789.4546$ $(\mathrm{M}+\mathrm{H})^{+}$. Calcd for $\mathrm{C}_{50} \mathrm{H}_{65} \mathrm{O}_{6} \mathrm{Si}$, 789.4550.

Ketone 25. Alcohol 24 ( $552 \mathrm{mg}, 0.7 \mathrm{mmol}$ ) was dissolved under $\mathrm{N}_{2}$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$. After successive addition of solid $\mathrm{NaHCO}_{3}(0.12 \mathrm{~g}$, ca. 1.4 mmol$)$ and Dess-Martin periodinane ( 0.6 g , ca. 1.4 mmol ), the mixture was stirred at room temperature until consumption of the starting material (ca. 45 min, TLC monitoring!). Workup (extraction with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) and column chromatography on silica gel (hexanes-EtOAc, 19:1) afforded compound 25 ( $468 \mathrm{mg}, 85 \%$ ): oil; $[\alpha]_{\mathrm{D}}-62.2$ (c $0.8, \mathrm{CHCl}_{3}$ ); IR $1725 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\delta 7.65-7.60(4 \mathrm{H}, \mathrm{m}), 7.45-$ $7.20(21 \mathrm{H}$, br m$), 4.62(1 \mathrm{H}, \mathrm{d}, J=11.6 \mathrm{~Hz}), 4.58(1 \mathrm{H}, \mathrm{d}, J=$ $11.6 \mathrm{~Hz}), 4.55-4.45(4 \mathrm{H}, \mathrm{m}), 4.35(1 \mathrm{H}, \mathrm{d}, J=3.4 \mathrm{~Hz}), 4.07$ ( $1 \mathrm{H}, \mathrm{dd}, ~ J=8.3,3.4 \mathrm{~Hz}$ ), $3.80(1 \mathrm{H}, \mathrm{dd}, J=9.3,8.3 \mathrm{~Hz}), 3.60-$ $3.55(3 \mathrm{H}, \mathrm{m}), 3.50(1 \mathrm{H}, \mathrm{dd}, J=8.3,2.5 \mathrm{~Hz}), 3.42(3 \mathrm{H}, \mathrm{s}), 3.05$
$(1 \mathrm{H}, \mathrm{m}), 2.36(1 \mathrm{H}, \mathrm{m}), 2.10(1 \mathrm{H}, \mathrm{m}), 1.10(3 \mathrm{H}, \mathrm{d}, J=6.8 \mathrm{~Hz})$, $1.04(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz}), 1.03(9 \mathrm{H}, \mathrm{s}), 0.95(3 \mathrm{H}, \mathrm{d}, J=6.8 \mathrm{~Hz})$; ${ }^{13} \mathrm{C}$ NMR $\delta 212.1,139.3,138.8,138.3,133.1,133.0,19.2$ (C), $135.5,135.4,129.8,128.3,128.2,128.1,128.0,127.8,127.5$, $127.4,127.3,127.2,127.1,88.3,81.4,80.0,45.4,37.4,36.1(\mathrm{CH})$, $74.2,73.1,72.6,70.8,67.6\left(\mathrm{CH}_{2}\right), 59.1,26.9(\times 3), 15.1,12.8$, $9.8\left(\mathrm{CH}_{3}\right)$. HR FAB MS m/ z $787.4353(\mathrm{M}+\mathrm{H})^{+}$. Calcd for $\mathrm{C}_{50} \mathrm{H}_{63} \mathrm{O}_{6} \mathrm{Si}$, 787.4393.

Hemiacetal 13. A solution of compound 25 ( $393 \mathrm{mg}, 0.5$ $\mathrm{mmol})$ in EtOAc $(100 \mathrm{~mL})$ was mixed with $10 \% \mathrm{Pd} / \mathrm{C}(1.6 \mathrm{~g})$ and placed under $\mathrm{H}_{2}$ in a pressure flask at 35 atm . After being stirred for 16 h , the crude mixture was filtered through Celite, all volatiles were removed in vacuo, and the residue was chromatographed on silica gel (hexanes-EtOAc, 7:3). This gave 13 in very variable and not reproducible yields (always $<30 \%$ ) as a somewhat unstable oil. $R_{f}$ on silica gel, 0.2 (elution with hexanes-EtOAc, 1:1): oil; $[\alpha]_{\mathrm{D}}-3.3\left(c 0.2, \mathrm{CHCl}_{3}\right)$; IR 3430 (br) $\mathrm{cm}^{-1}$; ${ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}+\mathrm{D}_{2} \mathrm{O}\right) \delta 7.70-7.65(4 \mathrm{H}, \mathrm{m})$, $7.40-7.30(6 \mathrm{H}$, br m$), 4.03(1 \mathrm{H}, \mathrm{dd}, J=9.4,3.6 \mathrm{~Hz}), 3.76(1 \mathrm{H}$, $\mathrm{m}), 3.65-3.65(1 \mathrm{H}, \mathrm{m}), 3.56(3 \mathrm{H}, \mathrm{s}), 3.50-3.45(2 \mathrm{H}, \mathrm{m}), 3.05$ $(2 \mathrm{H}, \mathrm{m}), 2.25(1 \mathrm{H}, \mathrm{m}), 1.88(2 \mathrm{H}, \mathrm{m}), 1.15(3 \mathrm{H}, \mathrm{d}, J=7 \mathrm{~Hz})$, $1.05(9 \mathrm{H}, \mathrm{s}), 0.97(3 \mathrm{H}, \mathrm{d}, J=6.7 \mathrm{~Hz}), 0.80(3 \mathrm{H}, \mathrm{d}, J=6.8 \mathrm{~Hz})$; ${ }^{13} \mathrm{C}$ NMR $\delta 134.1,134.0,100.4,19.2$ (C), 135.7, 135.6, 129.5, $129.4,127.5,127.3,84.4,78.3,73.6,42.4,40.3,29.6(\mathrm{CH}), 63.6$, $63.5\left(\mathrm{CH}_{2}\right), 61.1,26.9(\times 3), 18.0,12.1,11.5\left(\mathrm{CH}_{3}\right)$. HR EIMS $m / z$ (rel int.) $441.1928\left(\mathrm{M}^{+}-\mathrm{H}_{2} \mathrm{O}-t \mathrm{Bu}, 6\right), 423\left(\mathrm{M}^{+}-2 \mathrm{H}_{2} \mathrm{O}\right.$ $-t \mathrm{Bu}, 11), 391\left(\mathrm{M}^{+}-2 \mathrm{H}_{2} \mathrm{O}-\mathrm{MeOH}-t \mathrm{Bu}, 6\right), 285(41), 265$ (62), 199 (100). Calcd for $\mathrm{C}_{29} \mathrm{H}_{44} \mathrm{O}_{6} \mathrm{Si}-\mathrm{H}_{2} \mathrm{O}-t \mathrm{Bu}, 441.2091$.

Acknowledgment. Financial support has been granted by the Spanish Ministry of Education and Science (project BQU2002-00468), and by the AVCyT (projects GRUPOS03/180 and GV05/52). J.M. thanks the Spanish Ministry of Education and Science for a contract of the Ramón y Cajal program. S.D.-O. thanks the Consellería de Educaciò de la Generalitat Valenciana for a predoctoral fellowship. We further thank the S.C.S.I.E. at the University of Valencia for performing the mass spectral measurements.

Supporting Information Available: Description of the general features and chemical correlations, including reaction conditions, used to establish the configurations of the aldols and spectral data of some selected correlation products. Graphical NMR spectra of compounds 10a, 10b, 11a, 11b, 12a, $\mathbf{1 2 b}, 13-19$, and $22-25$, as well as of some correlation products.     (22) Van Draanen, N. A.; Arseniyadis, S.; Crimmins, M. T.; Heathcock, C. H. J. Org. Chem. 1991, 56, 2499-2506. For another example of the importance of dipole alignment in aldol TSs, see: Boeckman, R. K., Jr.; Connell, B. T. J. Am. Chem. Soc. 1995, 117, 12368-12369.

[^4]:    (23) Roush, W. R. J. Org. Chem. 1991, 56, 4151-4157. The quantitative importance of the syn pentane interaction in these reactions is underscored by the fact that pivalaldehyde does not react with the boron $Z$-enolates of ketones $\mathbf{1}$ and $\mathbf{2 .}^{3,4}$ In fact, if a TS is drawn for aldol reactions with this aldehyde, a steric interaction of the aforementioned type will always be present for all rotamers around the $t \mathrm{Bu}-\mathrm{CO}$ bond.
    (24) The various factors that may influence the stereochemical outcome of aldol reactions have been very lucidly analyzed by Danishefsky and co-workers in a recent publicaction: Lee, C. B.; Wu, Z.; Zhang, F.; Chappell, M. D.; Stachel, S. J.; Chou, T.-C.; Guan, Y.; Danishefsky, S. J. J. Am. Chem. Soc. 2001, 123, 5249-5259.

[^5]:    (25) This was established upon examination of NMR data for the crude aldol mixtures. In view of this synthetically useless result, we did not attempt to isolate individual compounds.
    (26) Provided that chelation is not involved in the transition state, achiral enolates react with $\alpha$-oxygenated aldehydes to yield predominantly, albeit with variable diastereoselectivity, the Felkin aldols. See refs 1 and 2. For more recent cases, see, for example: (a) Esteve, C.; Ferrerò, M.; Romea, P.; Urpí, F.; Vilarrasa, J. Tetrahedron Lett. 1999, 40, 5079-5082. (b) Lu, L.; Chang, H.-Y.; Fang, J.-M. J. Org. Chem. 1999, 64, 843-853. However, it is worth noting that Felkin aldols have been found to predominate in some reactions where chelation is likely to occur: Grandel, R.; Kazmaier, U.; Rominger, F. J. Org. Chem. 1998, 63, 4524-4528.
    (27) For nucleophilic additions to aldehydes bearing $\alpha$-heteroatoms other than oxygen, see, for example: (a) Reetz, M. T. Chem. Rev. 1999, 99, 1121-1162 ( $\alpha$-amino aldehydes). (b) Enders, D.; Piva, O.; Burkamp, F. Tetrahedron 1996, 52, 2893-2908 ( $\alpha$-sulphenyl aldehydes). (c) Enders, D.; Adam, J.; Klein, D.; Otten, T. Synlett 2000, 1371-1384 ( $\alpha$-silyl aldehydes). See also: Enders, D.; Burkamp, F. Collect. Czech. Chem. Commun. 2003, 68, 975-1006.
    (28) Cornforth, J. W.; Cornforth, R. H.; Mathew, K. K. J. Chem. Soc. 1959, 112-127. See also: Paddon-Row, M. N.; Rondan, N. G.; Houk, K. N. J. Am. Chem. Soc. 1982, 104, 7162-7166.

[^6]:    (29) Doubly diastereoselective aldol reactions of chiral enolates with chiral $\alpha$-oxygenated aldehydes are not extensively documented in the literature. Matched and mismatched processes have been reported, with the full range from total stereocontrol by the enolate to complete dominance of the aldehyde being observed. See refs 1 and 2 and, for further cases: (a) Nicolaou, K. C.; Piscopio, A. D.; Bertinato, P.; Chakraborty, T. K.; Minowa, N.; Koide, K. Chem.-Eur. J. 1995, 1, 318333. (b) Sibi, M. P.; Lu, J.; Edwards, J. J. Org. Chem. 1997, 62, 58645872. (c) Kobayashi, S.; Furuta, T. Tetrahedron 1998, 54, 10275-10294. (d) Esteve, C.; Ferrerò, M.; Romea, P.; Urpí, F.; Vilarrasa, J. Tetrahedron Lett. 1999, 40, 5083-5086. (e) Nicolaou, K. C.; Pihko, P. M.; Diedrichs, N.; Zou, N.; Bernal, F. Angew. Chem., Int. Ed. 2001, 40, 1262-1265. (f) Forsyth, C. J.; Hao, J.; Aiguade, J. Angew. Chem., Int. Ed. 2001, 40, 3663-3667. (g) Davies, S. G.; Nicholson, R. L.; Smith, A. D. Org. Biomol. Chem. 2004, 2, 3385-3400. For a recent review on doubly and multiply stereoselective reactions, see: Kolodiazhnyi, O. I. Tetrahedron 2003, 59, 5953-6018.
    (30) Excluded from this discussion are chiral enolates in which the chirality resides in the ligands bound to the heteroatom. In these cases, stereocontrol by the chiral auxiliary is usually observed. See, for example: Gennari, C.; Pain, G.; Moresca, D. J. Org. Chem. 1995, 60, 6248-6249.

[^8]:    (36) In our first approach to 13, MOM protecting groups were used for the hydroxyl functions of diol 14. However, they proved incompatible with the acidic reaction conditions necessary for the deprotection of the cyclohexanone acetal: a great amount of decomposition was observed under a variety of conditions, as well as formation of formaldehyde acetals as byproducts.
    (37) (a) Greene, T. W.; Wuts, P. G. M. Protective Groups in Organic Synthesis, 3rd ed.; John Wiley and Sons: New York, 1999; pp 215217. (b) Kocienski, P. J. Protecting Groups, 3rd ed.; Georg Thieme Verlag: Stuttgart, 2004; pp 133-137. For instance, acidic conditions such as $80 \%$ aq AcOH or PPTS/MeOH gave yields of around $50-60 \%$ (based on recovered starting material), together with ill-defined byproducts.

    (42) At least one case is known where the strong Felkin stereofacial bias of an $\alpha$-oxygenated aldehyde forced the formation of an anti aldol from the $Z$-boron enolate of a chiral $N$-acyloxazolidinone: Evans, D. A.; Kaldor, S. W.; Jones, T. K.; Clardy, J.; Stout, T. J. J. Am. Chem. Soc. 1990, 112, 7001-7031. In the present case, however, a matched double diastereoselection can be expected between the known facial preference of the boron enolate of $\mathbf{2 1}$ and the Felkin bias of aldehyde 20: both factors predict here a predominant enolate attack to the aldehyde carbonyl $S i$ face. For a very similar situation, see ref $29 b$ b.

    (44) Our efforts to perform hydrogenolytic debenzylation of 25 , while providing the desired $\mathbf{1 3}$ (as its hemiacetal form in the assumedly most stable anomer), have not yet given satisfactory and reproducible yields ( $<30 \%$ ), even if various reaction conditions have been tried. Unfortunately, many otherwise useful debenzylating reagents (e.g., Na in liquid $\mathrm{NH}_{3}$ or Li di-tert-butyldiphenylide) are precluded here due to the presence of the $\alpha$-alkoxy ketone moiety. We are presently investigating other methods to improve the yield of this critical deprotection step, as well as the use of alternative protecting groups.
