Received July 14, 2006

The easily available macrocyclic diimines 4-7 can be stereoselectively transformed to macrocyclic bis- β -amino acids 13-17, macrocyclic bisazetidines 18-20, and macrocyclic bisamides 21 and 22 by means of the corresponding bis- β -lactam scaffolds 8-12. These key intermediates are available through standard Staudinger reaction and obtained as the *cis-cis* diastereomers, exclusively. An interesting relation between the proximity of the reactive C=N bonds and the selectivity in the formation of the bis- β -lactams 8-12is observed. Thus, diimine 4 leads to low selectivities, producing a 1:1 mixture of *cis-syn-cis* and *cisanti-cis* diastereomers, while diimines 5-7 having the diimine sites more separated lead almost exclusively to the *cis-anti-cis* diastereomers. The stereochemistry of all the products was unambiguously assigned by X-ray diffraction analysis of compounds *cis-syn-cis* 8 and *cis-anti-cis* 12-Co₂CO₆ complex.

Introduction

Despite the plethora of synthesis of compounds having the β -lactam ring¹ and the number of transformations in which the 2-azetidinone ring is involved,² the scarce use of these com-

pounds in the functionalization of macrocycles is surprising. Romo³ and Wasserman⁴ have elegantly employed the 2-azetidinone ring as a macrolactamization agent. Hegedus reported the synthesis of cyclams and biscyclams⁵ starting from azacarbapenams and bisazacarbapenams, respectively. Otherwise, the building of one or more β -lactam rings in a preformed macrocyclic imine or polyimine to further manipulate the four-

 $^{^{\}dagger}$ To whom inquires regarding the X-ray determination of the structures of compound 8 and compound 12-Co₂(CO)₆ should be addressed.

membered ring and to produce differently functionalized macrocycles is unknown. 6

Macrocyclic polyimines have been prepared in the context of metal chelating cavities,⁷ and they are very attractive scaffolds to construct macrocyclic bisazetidinones that can be further elaborated to macrocyclic polyamino acids, macrocyclic amides, and macrocyclic azetidines within the diversity oriented synthesis (DOS) concept.⁸ Reported in this paper is the implementation of this idea.

Results and Discussion

Dialdehydes $1-3^9$ were condensed with 1,3-diaminopropane and 1,4-diamino-2-butyne in nearly quantitative yields in boiling MeOH or EtOH to form the macrocyclic imines 4-7 used in this work (Scheme 1). The reaction conditions have been tuned up to avoid the formation of dimers or oligomers as byproducts.¹⁰ Diimine 4 was reacted with phenoxyacetyl chloride in dry CH_2Cl_2 at -78 °C in the presence of Et_3N . After heating to room temperature and quenching with MeOH/H₂O, a 1:1 mixture of two bis- β -lactam derivatives (78% yield) was obtained. The mixture was separated by column chromatography to yield compounds 8 and 9, isolated in 23 and 27% yields, respectively (Scheme 2). Both compounds have a cis-cis stereochemistry in the β -lactam ring as deduced from the coupling constants of H3-H4 and H3'-H4' protons ($J_{3,4} = 4.5$ and 4.4 Hz for compounds 8 and 9, respectively).¹¹ Therefore, the reaction yielded both the cis-syn-cis 8 and the cis-anti-cis 9 isomers. No trace amounts of any of the remaining isomers having one or both rings in a trans-stereochemistry were detected. A single crystal of *cis-syn-cis* 8 was submitted to X-ray diffraction analysis thus unambiguously establishing this relative stereochemistry.

Having unambiguously characterized compound **8** as the *cis-syn-cis* isomer, the *cis-anti-cis* stereochemistry was assigned to compound **9**. Reactions of imines 5-7 and phenoxyacetyl chloride under the conditions discussed above yielded products **10**, **11**, and **12** in 78, 45, and 74%, respectively. Compounds

(10) The formation of dimers and oligomers as undesired byproducts in the synthesis of macrocyclic diimines depends not only on the reaction conditions employed but also on the size and conformational flexibility of the molecules involved. See for example: Simion, A.; Simion, C.; Kanda, T.; Nagashima, S.; Mitoma, T.; Yamada, T.; Mimura, K.; Tashiro, M. J. Chem. Soc., Perkin Trans. 1 2001, 2071 and ref 7a.

(11) The most usual method for the determination of the relative stereochemistry of 2-azetidinones is ¹H NMR. The $J_{3,4}$ *cis* value is ca. 4.5–6 Hz, while $J_{3,4}$ *trans* is ca. 2–2.5 Hz. See for example: (a) Manhas, M. S.; Ghosh, M.; Bose, A. K. J. Org. Chem. **1990**, 55, 575. (b) Sharma, A. K.; Mazumdar, S. N.; Mahajan, M. P. J. Org. Chem. **1996**, 61, 5506. (c) Alcázar, R.; Ramírez, P.; Vicente, R.; Mancheño, M. J.; Sierra, M. A.; Gómez-Gallego, M. *Heterocycles* **2001**, 55, 511.

SCHEME 1

10–12 were isolated as single diastereomers. Traces (<10%) of the other *cis-cis* diastereomers were observed in the crude reaction mixture, but they could not be isolated. All compounds **10–12** have the signal corresponding to the β -lactam H4 shielded (4.88, 4.88, and 5.38 ppm, respectively) compared to that of the minor isomers (5.34, 5.36, and 5.58 ppm, respectively¹²). This shielding was also observed in compound **9** ($\delta_{H4} = 5.17$) compared to compound **8** ($\delta_{H4} = 5.41$) from which the

⁽⁶⁾ The formation of some macrocyclic bis- β -lactams in very low yields has been reported for the preparation of 4,7-fused β -lactam synthesis. See: Brooks, G.; Hunt, E. J. Chem. Soc., Perkin Trans. 1 **1983**, 115.

⁽¹²⁾ Data measured in $^1\mathrm{H}$ NMR spectra of the mixtures enriched in these minor isomers.

relative stereochemistry was unambiguously ascertained by X-ray analysis. Therefore, the *cis-anti-cis* stereochemistry was assigned to products 10-12 (Scheme 3).¹³ Definitive confirmation of the stereochemical assignment for these compounds was achieved by preparing the Co₂(CO)₆ complex derived from 12. Compound $12 \cdot Co_2(CO)_6$ produced crystals suitable for X-ray diffraction analysis that unambiguously confirmed the *cis-anti-cis* stereochemistry of this product and, by analogy, the validity of the stereochemical assignment made for compounds 9-11.

SCHEME 3

The stereochemistry observed in the double Staudinger reaction leading to compounds 8-12 deserves some comments. It is known that cyclic imines prefer to form the *trans*- β -lactams due to the fixed Z-configuration of the imine C=N bond imposed by the cyclic structure.¹⁴ This is not the case for macrocyclic imines 4-7 that have *E*-configuration¹⁵ and follow the usual pattern observed for open-chain imines¹⁶ giving only the *cis*- β -lactams. More intriguing is the observed selectivity during the formation of the bis- β -lactam system. Except for diimine 4, which forms the equimolecular amount of *cis-syn*cis and cis-anti-cis isomers, imines 5-7 have a clear bias for the formation of cis-anti-cis isomers. These facts suggest a direct influence of one of the emerging four-membered rings on the torquoselectivity¹⁷ of the second ring closure but only when both centers are not too close to each other as in compound 4, in which the tether between the O-Ar groups is a CH₂-CH₂ chain (compare the stereochemistry of the reaction products derived from compounds 4 and 5 or 7). The formation of 1:1

SCHEME 4

syn/anti diastereomeric mixtures has been also reported in the synthesis of acyclic *cis*-bis- β -lactams linked by an ethylene bridge.¹⁸ The origin of the selectivity in the formation of β -lactams and the influence of several factors (structural, electronic, reaction conditions) is still a subject of debate.^{14b} The diastereoselectivity reported in this paper may be due to a better stabilization of the intermediate zwitterions and could be topologically demanding. While this effect has been observed previously in peripheral functionalization,¹⁹ it has not been rationalized. A theoretical model to reflect this effect is being developed in our laboratories and will be reported in due time.

With an efficient and stereoselective entry to macrocyclic bis- β -lactams ascertained, the use of these compounds as scaffolds to obtain functionalized macrocycles was explored next. The hydrolysis of compounds **8–12** to the novel macrocyclic bis- β -amino acids **13–17** was carried out by boiling compounds **8–12** in 10 N HCl. The amino acids were obtained as hydrochlorides in good to excellent yields with retention of the stereochemistry of the starting bis- β -lactam. The use of Evans' conditions (LiOH, H₂O₂ at 0 °C)²⁰ in compounds **8–10** also formed bisamino acids **13–15** in good yields (Scheme 4).

⁽¹³⁾ Preliminary MM studies carried out with compounds 8 and 9 show that the rigidity imposed in the macrocycle by the embedding of two β -lactam ring places the aromatic ring of one four-membered ring close to the other in the *cis-anti-cis* isomer. This effect is not seen in the *cis-syn-cis* isomer.

SCHEME 5

The amide C=O group of compounds **8**, **9**, and **12** was reduced to form the corresponding bisazetidines $18-20^{21}$ in the presence of AlCl₂H in very high yields.²² Compounds 18-20 were obtained as single stereoisomers and retain the stereochemistry of the starting 2-azetidinones (Scheme 5). It should be noted that *cis-syn-cis* bis- β -lactam **8** and its derivatives **13** and **18** are meso-forms, while the *cis-anti-cis* bis- β -lactams **9–12** and their derivatives **14–20** are racemic mixtures. This may be of interest if an enantioselective route to these compounds will be developed.

To finally demonstrate the versatility of macrocyclic bis- β -lactams 8–12 to produce functionalized macrocycles, compounds 8–10 were submitted to reaction with Li/NH₃. Under these conditions, macrocycles 21 and 22 were produced in high yields. It is worthy to note that together with the fragmentation of the N1–C4 bond breakage the phenoxy group is also reductively removed.

In conclusion, easily available macrocyclic imines can be stereoselectively transformed to macrocyclic bis- β -amino acids, macrocyclic bisazetidines, and macrocyclic bisamides by means of the corresponding bis- β -lactam scaffolds. These key intermediates are available through standard Staudinger reaction. Efforts to extend this approach to the peripheral functionalization of bigger macrocycles and to use the obtained products as chelating agents are being currently pursued in our laboratories.

Experimental Section

General procedures have been previously reported.²³ Dialdehydes 1 and 2 were obtained following the reported procedure.⁹ Dimines 4-7 were prepared following a modification of the literature procedure.^{7a,10}

Synthesis of Dialdehyde 3: K₂CO₃ (30 g, 0.2 mol) was suspended in butanone (75 mL) in a two-neck round flask equipped with a reflux condenser and magnetic stirring bar. A solution of 2-hydroxynaphthalene-1-carbaldehyde (4 g, 0.023 mol) in butanone (40 mL) was added dropwise, and the solution became dark green. The mixture was purged with argon and stirred under reflux for 1.30 h. Then, NaI (80 mg, 05. mol) and a solution of 1,3dibromopropane (2.42 g, 0.012 mol) in butanone (20 mL) was added. The mixture was stirred under reflux under argon for 48 h. After reaching room temperature, the crude reaction mixture was filtered through Celite, then 100 mL of distilled water was added to the organic layer that was subsequently extracted with dichloromethane (3 \times 100 mL). The organic extracts were dried over MgSO₄, filtered, and evaporated to dryness at reduced pressure. The resulting solid was recrystallized in EtOH to yield 1.38 g (30%) of a pale brown solid: mp 193-196 °C; ¹H NMR (300 MHz, CDCl₃) δ 10.95 (s, 2H), 9.24 (d, J = 8.7 Hz, 2H), 8.06 (d, J = 9.2Hz, 2H), 7.77 (d, J = 8.0 Hz, 2H), 7.65–7.59 (m, 2H), 7.45–7.42 (m, 2H), 7.29 (d, J = 9.2 Hz, 2H), 4.50 (t, J = 5.9 Hz, 4H), 2.50 (q, J = 5.9 Hz, 2H); ¹³C NMR (75 MHz, CDCl₃) δ 191.5, 163.0, 137.7, 131.5, 129.9, 128.6, 128.2, 124.9, 124.8, 116.8, 113.2, 65.6, 29.5; IR (KBr) v_{max} 3442, 2935, 2887, 1670,1591, 1512, 1245, 1151, 1058 cm⁻¹. Anal. Calcd for C₂₅H₂₀O₄: C, 78.11; H, 5.24. Found: C, 78.32; H, 5.41.

General Procedure for the Synthesis of β -Lactams (8–12): A solution of phenoxyacetyl chloride in dry CH₂Cl₂ was purged with argon and cooled at -78 °C. Then, a solution of triethylamine in dry CH₂Cl₂ was added dropwise. The mixture was stirred for 30 min, and a solution of the corresponding diimine in dry CH₂Cl₂ was added dropwise by means of a syringe pump for 2 h. The reaction mixture was stirred at room temperature for the periods specified in each case, quenched with MeOH and water, and extracted with CH₂Cl₂. The organic layer was washed with 0.5 M HCl (to remove the excess of triethylamine) and brine, and then dried with MgSO₄. The desiccant was removed by filtration and the solvent evaporated at reduced pressure. The crude solid was suspended in Et₂O, filtered, and dried.

Synthesis of β-Lactams 8 and 9: Following the general procedure, phenoxyacetyl chloride (1.77 g, 10.4 mmol) in dry CH₂-Cl₂ (20 mL), triethylamine (2.11 g, 20.8 mmol) in dry CH₂Cl₂ (10 mL), and diimine 4 (1.07 g, 3.5 mmol) in dry CH₂Cl₂ (10 mL) were reacted for 16 h. The reaction yielded 1.58 g (78%) of a 1:1 mixture of isomers 8 and 9. The isomers were separated by flash chromatography in hexane/AcOEt 7:3 affording 465 mg (23%) of 8 and 550 mg (27%) of 9. The structure of 8 was confirmed by X-ray diffraction. β-Lactam 8: white crystals; mp 215–217 °C (CH₂Cl₂/MeOH); ¹H NMR (300 MHz, CDCl₃) δ 7.40 (dd, $J_1 =$

Synthesis of β -Lactam 10: Following the general procedure, phenoxyacetyl chloride (2.25 g, 13.2 mmol) in CH₂Cl₂ (20 mL), triethylamine (2.67 g, 26.4 mmol) in CH₂Cl₂ (10 mL), and diimine 5 (1.42 mg, 4.4 mmol) in CH_2Cl_2 (10 mL) were reacted for 15 h. The crude reaction yielded 2.04 g (78%) of β -lactam 10 as white crystals: mp 225-228 °C (CH2Cl2/MeOH 3:1); ¹H NMR (300 MHz, CDCl₃) δ 7.30 (dd, $J_1 = 7.5$ Hz, $J_2 = 1.6$ Hz, 2H), 7.21 (dt, $J_1 = 7.8$ Hz, $J_2 = 1.6$ Hz, 2H), 7.08 (t, J = 7.5 Hz, 4H), 6.99 (t, J = 7.5 Hz, 2H), 6.88–6.74 (m, 4H), 6.60 (d, J = 8.0 Hz, 4H), 5.42 (d, J = 4.3 Hz, 2H), 4.88 (d, J = 4.3 Hz), 4.30–4.25 (m, 2H), 4.03-3.99 (m, 2H), 3.80-3.66 (m, 2H), 2.82-2.73 (m, 2H), 2.41-2.31 (m, 2H), 1.84-1.74 (m, 2H); ¹³C NMR (75 MHz, CDCl₃) & 165.7, 156.9, 156.5, 129.8, 128.7, 128.5, 121.7, 121.0, 120.4, 115.3, 111.8, 81.4, 66.6, 53.6, 35.8, 28.7, 22.9; IR (KBr) $\nu_{\rm max}$ 3486, 2925, 1751, 1598, 1589, 1490, 1404, 1290, 1232, 1087 cm⁻¹. ESI-MS: 591.1 [M + H]⁺. Anal. Calcd for $C_{36}H_{34}N_2O_6$: C, 73.20; H, 5.80. Found: C, 73.42; H, 5.66.

Synthesis of β -Lactam 11: Following the general procedure, phenoxyacetyl chloride (725 mg, 4.26 mmol) in CH₂Cl₂ (15 mL), triethylamine (860 mg, 8.5 mmol) in CH₂Cl₂ (10 mL), and diimine 7 (600 mg, 1.42 mmol) in CH₂Cl₂ (5 mL) were reacted for 20 h. The crude reaction mixture was purified by flash chromatography in hexane/AcOEt (1:1) to yield 450 mg (45%) of β -lactam 11 as white crystals: mp 135-138 °C (CH₂Cl₂/MeOH 3:1); ¹H NMR (300 MHz, CDCl₃) δ 8.16 (d, J = 8.3 Hz, 2H), 7.79 (d, J = 9.0Hz, 2H), 7.73 (d, J = 7.6 Hz, 2H), 7.48 (t, J = 7.1 Hz, 2H), 7.36 (t, J = 7.1 Hz, 2H), 7.28 (d, J = 9.0 Hz, 2H), 7.03 (t, J = 7.6 Hz, 4H), 6.80 (t, J = 7.1 Hz, 2H), 6.60 (d, J = 8.2 Hz, 4H), 6.11 (d, J = 4.6 Hz, 2H), 5.28 (d, J = 4.6 Hz, 2H), 4.59–4.48 (m, 2H), 4.46-4.35 (m, 2H), 3.59-3.48 (m, 2H), 2.66-2.53 (m, 4H), 1.81-1.72 (m, 2H); ¹³C NMR (75 MHz, CDCl₃) δ 165.7, 156.8, 156.1, 133.5, 131.9, 129.8, 129.6, 128.8, 128.6, 127.2, 124.7, 124.0, 121.6, 115.0, 114.2, 113.5, 82.8, 67.1, 54.6, 37.6, 29.6, 23.7; IR (KBr) $\nu_{\rm max}$ 3431, 1755, 1669, 1596, 1494, 1240, 1058, 1037 cm⁻¹. Anal. Calcd for C₄₄H₃₈N₂O₆: C, 76.50; H, 5.54. Found: C, 76.72; H, 5.66

Synthesis of β-Lactam 12: Following the general procedure, phenoxyacetyl chloride (1.79 g, 10.5 mmol) in CH₂Cl₂ (15 mL), triethylamine (2.13 g, 21.1 mmol) in CH₂Cl₂, and diimine **6** (1.12 g, 3.52 mmol) in CH₂Cl₂ (15 mL) were reacted for 18 h. The crude solid product was dispersed in 100 mL of diethyl ether, filtered, and dried under vacuum to afford 1.53 g (74%) of pure β-lactam **12** as white crystals: mp 266–268 °C (CH₂Cl₂/MeOH 3:1); ¹H NMR (300 MHz, CDCl) δ 7.37–7.26 (m, 4H), 7.14–7.00 (m, 6H), 6.91–6.79 (m, 4H), 6.71 (d, *J* = 7.9 Hz, 4H), 5.65 (d, *J* = 4.6 Hz, 2H), 5.39 (d, *J* = 4.6 Hz, 2H), 4.64 (d, *J* = 17.1 Hz, 2H), 4.38 (d, *J* = 7.3 Hz, 2H), 4.24 (d, *J* = 7.3 Hz, 2H), 3.56 (d, *J* = 17.1 Hz, 2H); ¹³C NMR (75 MHz, CDCl₃) δ 165.4, 156.73, 156.70, 129.6, 128.8, 128.0, 121.8, 120.8, 120.7, 115.4, 110.6, 82.3, 77.1, 66.4, 53.7, 29.4; IR (KBr) ν_{max} 1770, 1596, 1492, 1400, 1292, 1230,

1091, 1064 cm⁻¹. Anal. Calcd for $C_{36}H_{30}N_2O_6$: C, 73.71; H, 5.15. Found: C, 73.94; H, 5.33.

Synthesis of 12·Co₂(CO)₆ Complex: In a flame-dried roundbottom flask equipped with a magnetic stirring bar and in an argon atmosphere, a solution of β -lactam 12 (100 mg, 0.17 mmol) in dry and degassed CH₂Cl₂ (10 mL) was stirred with Co(CO)₆ (87 mg, 0.26 mmol) for 3 h. The crude product was filtered through Celite, and the solvent was evaporated at reduced pressure. The reaction yields 140 mg (94%) of a purple solid. The cobalt complex was recrystallized in MeOH/CH₂Cl₂ (1:1) to produce suitable crystals that were analyzed by NMR and X-ray: ¹H NMR (200 MHz, CDCl₃) δ 7.37 (d, J = 7.3 Hz, 2H), 7.31–7.23 (m, 2H), 7.12 (t, J= 7.8 Hz, 4H), 6.98 (t, J = 7.3 Hz, 2H), 6.88 (t, J = 7.3 Hz, 2H), 6.83–6.71 (m, 6H), 5.56 (d, J = 4.3 Hz, 2H), 5.43 (d, J = 4.3 Hz, 2H), 5.23 (d, $J_2 = 16.3$ Hz, 2H), 4.45 (s, 4H), 3.98 (d, $J_2 = 16.3$ Hz, 2H); ¹³C NMR (75 MHz, CDCl₃) δ 198.8, 166.3, 156.9, 156.7, 130.4, 130.1, 129.0, 121.9, 120.9, 120.3, 115.5, 110.9, 90.0, 82.2, 65.7, 58.1, 43.0.

General Procedure for the Synthesis of β -Amino acids 13– 17: In a round-bottom flask equipped with a magnetic stirring bar and a reflux condenser, a suspension of the corresponding β -lactam in 10 M HCl was refluxed for 24–48 h. The crude product was extracted with CH₂Cl₂, and the aqueous layer was dried and the solvent removed at reduced pressure. The solid obtained was washed with CH₂Cl₂. The amino acids were obtained as hydrochlorides.

Synthesis of β-Amino acid 13: A suspension of β-lactam **8** (400 mg, 0.68 mmol) in 10 M HCl (25 mL) was refluxed for 24 h. β-Amino acid **13** (350 mg, 86%) was obtained as a pale pink solid: ¹H NMR (300 MHz, DMSO-*d*₆, 65 °C) δ 7.79 (d, J = 7.5 Hz, 2H), 7.42–7.28 (m, 2H), 7.27–7.14 (m, 4H), 7.11–6.89 (m, 10H), 5.33 (d, J = 8.2 Hz, 2H), 5.10 (d, J = 8.2 Hz, 2H), 4.56–4.49 (m, 2H), 4.39–4.29 (m, 2H), 2.94–2.82 (m, 2H), 2.64–2.52 (m, 2H), 2.20–2.09 (m, 2H); ¹³C NMR (75 MHz, CD₃OD) δ 170.7, 158.2, 157.8, 133.6, 130,9, 124.1, 123.1, 118.4, 117.2, 116.9, 113.5, 78.5, 67.4, 55.0, 43.0, 22.4; IR (KBr) ν_{max} 3411, 2939, 1735, 1589, 1496, 1224, 1180, 1053 cm⁻¹. ESI-MS: 613.7 [M + H]⁺. Anal. Calcd for C₃₅H₃₈N₂O₈Cl₂: C, 61.32; H, 5.59; Cl, 10.34; N, 4.09. Found: C, 61.18; H, 5.42.

Synthesis of β-Amino acid 14: A suspension of β-lactam **9** (100 mg, 0.17 mmol) in 10 M HCl (15 mL) was refluxed for 24 h. β-Amino acid **14** (95 mg, 90%) was obtained as a pale pink solid: ¹H NMR (500 MHz, DMSO- d_6 , 65 °C) δ 7.73 (d, J = 7.1 Hz, 2H), 7.37 (t, J = 7.8 Hz, 2H), 7.22 (t, J = 7.8 Hz, 4H), 7.10 (d, J = 8.3 Hz, 2H), 7.02–6.89 (m, 8H), 5.35 (d, J = 8.7 Hz, 2H), 5.01 (d, J = 8.7 Hz, 2H), 4.38 (s, 4H), 3.06–2.97 (m, 2H), 2.92–2.86 (m, 2H), 2.18–2.12 (m, 2H); ¹³C NMR (125 MHz, DMSO- d_6 , 65 °C) δ 168.0, 156.2, 156.1, 131.0, 129.8, 128.9, 121.8, 120.5, 118.1, 115.7, 111.7, 77.2, 66.4, 53.7, 42.5, 20.5; IR (KBr) ν_{max} 3412, 2941, 1734, 1586, 1495, 1224, 1177, 1054 cm⁻¹. Anal. Calcd for C₃₅H₃₈N₂O₈Cl₂: C, 61.32; H, 5.59; Cl, 10.34; N, 4.09. Found: C, 61.60; H, 5.37.

Synthesis of β-Amino acid 15: A suspension of β-lactam **10** (250 mg, 0.42 mmol) in 10 M HCl (25 mL) was refluxed for 72 h. β-Amino acid **15** (220 mg, 85%) was obtained as a pale pink solid: ¹H NMR (300 MHz, DMSO- d_6) δ 7.75 (d, J = 7.8 Hz, 2H), 7.38–7.26 (m, 2H), 7.22 (t, J = 7.9 Hz, 4H), 7.12 (d, J = 8.2 Hz, 2H), 7.06–6.88 (m, 4H), 6.84 (d, J = 8.2 Hz, 4H), 5.08 (d, J = 8.1 Hz, 2H), 5.01 (d, J = 8.1 Hz, 2H), 4.36–4.28 (m, 2H), 4.08–3.99 (m, 2H), 2.87–2.78 (m, 2H), 2.69–2.58 (m, 2H), 2.19–2.10 (m, 2H), 1.94–1.82 (m, 2H); ¹³C NMR (75 MHz, CD₃OD) δ 170.4, 158.9, 158.0, 133.5, 130.8, 130.2, 124.0, 123.4, 119.4, 117.1, 116.0, 78.9, 68.8, 54.7, 43.2, 30.2, 20.3; IR (KBr) ν_{max} 3421, 2939, 1733, 1589, 1494, 1226, 1180, 1055 cm⁻¹. Anal. Calcd for C₃₅H₃₈N₂O₈-Cl₂: C, 61.80; H, 5.76; Cl, 10.13; N, 4.00. Found: C, 61.58; H, 5.77.

Synthesis of β -Amino acid 16: A suspension of β -lactam 11 (80 mg, 0.11 mmol) in 6 M HCl (15 mL) was refluxed for 24 h. β -Amino acid 16 (38 mg, 42%) was obtained as a pale brown solid: ¹H NMR (300 MHz, CD₃OD) δ 8.17 (d, J = 8.9 Hz, 2H),

7.62 (d, J = 7.8 Hz, 2H), 7.53 (t, J = 7.2 Hz, 2H), 7.40–7.30 (m, 10H), 7.07 (t, J = 7.2 Hz, 2H), 6.88 (d, J = 8.2 Hz, 4H), 5.25 (d, J = 9.2 Hz, 2H), 5.12 (d, J = 9.2 Hz, 2H), 4.91–4.84 (m, 2H), 4.62–4.51 (m, 2H), 3.00–2.88 (m, 4H), 2.70–2.57 (m, 2H), 1.86–1.76 (m, 2H); ¹³C NMR (50 Hz, CD₃OD) δ 168.4, 159.2, 157.6, 134.6, 132.9, 131.0, 130.6, 130.1, 128.8, 124.7, 123.2, 122.4, 116.7, 116.4, 116.2, 80.6, 71.6, 64.5, 58.9, 30.9, 30.4; IR (KBr) ν_{max} 3425, 2933, 1735, 1587, 1495, 1231, 1118, 1057 cm⁻¹. General Procedure for the Hydrolysis with LiOH/H₂O₂: In a round-bottom flask equipped with a magnetic stirring bar, a solution (or suspension) of the corresponding β -lactam in THF/H₂O (3:1) was cooled to 0 °C with an ice bath prior to the addition of H₂O₂ (30%). Then, LiOH·H₂O was added to the mixture at 0 °C. The system was left to reach room temperature, and the reaction was stirred until complete disappearance of the starting β -lactam (followed by TLC in CHCl₃/MeOH (1:1)). The reaction was quenched with a 1.5 M solution of Na₂SO₃. The crude mixture was extracted with CH₂Cl₂, and the aqueous layer was evaporated at reduced pressure. The solid obtained was purified by flash chromatography in CHCl₃/MeOH.

Reaction of β -Lactam 8 with LiOH/H₂O₂: Following the general procedure, from β -lactam 8 (250 mg, 0.44 mmol), 30% H₂O₂ (534 mg, 5.2 mmol), and LiOH·H₂O (80 mg, 1.6 mmol). After 6 h at room temperature, the reaction was quenched, extracted, and the residue purified by flash chromatography (CHCl₃/MeOH, 2:1) to yield 200 mg (74%) of β -amino acid **13** as a white powder.

Reaction of β **-Lactam 9 with LiOH/H₂O₂:** Following the general procedure, from β -lactam 9 (250 mg, 0.44 mmol), 30% H₂O₂ (534 mg, 5.2 mmol), and LiOH·H₂O (80 mg, 1.6 mmol). After 6 h at room temperature, the reaction was quenched, extracted, and the residue purified by flash chromatography (CHCl₃/ MeOH, 2:1) to yield β -amino acid 14 (200 mg, 74%) as white powder.

Reaction of β **-Lactam 10 with LiOH/H₂O₂:** Following the general procedure, from a suspension of β -lactam **10** (250 mg, 0.42 mmol), 30% H₂O₂ (534 mg, 5.2 mmol), and LiOH·H₂O (80 mg, 1.6 mmol). After 6 h at room temperature, the reaction was quenched, extracted, and the residue purified by flash chromatography (CHCl₃/MeOH, 2:1) to yield β -amino acid **15** (200 mg, 75%) as a white powder.

General Procedure for the Synthesis of Azetidines (18–20): To a suspension of LiAlH₄ in dry THF in a flame-dried roundbottom flask equipped with a magnetic stirring bar under argon and at 0 °C was transferred a solution AlCl₃ in dry THF via cannula. The mixture was stirred for 30 min at room temperature to form the alane. Then, the suspension was cannulated over a solution of the β -lactam in dry THF at 0 °C. The reaction was stirred for 20 min at room temperature, then quenched with ice and extracted with diethyl ether (3 × 10 mL). The organic layer was washed with brine and dried with MgSO₄. The solvent was evaporated under reduced pressure to yield pure azetidines.

Synthesis of Azetidine 18: Following the general procedure from 20.2 mg (0.53 mmol) of LiAlH₄, 70 mg (0.53 mmol) of AlCl₃, and 50 mg (0.086 mmol) of β -lactam 8. After 20 min of vigorous

stirring, the reaction was quenched and extracted to afford 45 mg (95%) of azetidine **18** as brown oil: ¹H NMR (200 MHz, CDCl₃) δ 7.96 (dd, J = 7.4, 1.6 Hz, 2H), 7.19 (dt, J = 8.0, 1.6 Hz, 2H), 7.09 (t, J = 7.6 Hz, 4H), 7.00–6.87 (m, 4H), 6.77 (t, J = 7.6 Hz, 2H), 6.53 (dd, $J_1 = 8.1$ Hz, $J_2 = 0.9$ Hz, 4H), 4.71 (dt, $J_1 = 6.4$ Hz, $J_2 = 2.0$ Hz, 2H), 4.59 (d, J = 8.0 Hz, 2H), 4.45–4.36 (m, 4H), 3.66 (d, J = 9.4 Hz, 2H), 3.14 (dd, $J_1 = 9.4$ Hz, $J_2 = 6.4$ Hz, 2H), 2.66–2.54 (m, 2H), 2.43–2.33 (m, 2H), 1–14–1.01 (m, 2H); ¹³C NMR (50 MHz, CDCl₃) δ 157.4, 155.7, 133.3, 128.8, 128.1, 126.3, 120.4, 120.2, 114.8, 110.7, 70.4, 67.0, 62.0, 58.8, 56.4, 29.6; IR (KBr) ν_{max} 3031, 2922, 1598, 1587, 1487, 1452, 1222, 1109, 1055, 1026 cm⁻¹. Anal. Calcd for C₃₅H₃₆N₂O₄: C, 76.62; H, 6.61. Found: C, 76.75; H, 6.79.

Synthesis of Azetidine 19: Following the general procedure, from 16 mg (0.43 mmol) of LiAlH₄, 56 mg (0.43 mmol) of AlCl₃, and 40 mg (0.069 mmol) of *β*-lactam **9**. After 20 min of vigorous stirring, the reaction was quenched and extracted to afford 32 mg (95%) of azetidine **19** as brown oil: ¹H NMR (300 MHz, CDCl₃) δ 7.78 (dd, *J* = 7.6, 1.6 Hz, 2H), 7.23–7.07 (m, 6H), 7.00–6.77 (m, 6H), 6.67 (d, *J* = 8.1 Hz, 2H), 5.44 (d, *J* = 6.1 Hz, 2H), 5.12 (dt, *J*₁ = 6.1 Hz, *J*₂ = 3.0 Hz, 2H), 4.48–4.40 (m, 4H), 3.75–3.64 (m, 4H), 2.79–2.58 (m, 4H), 1.26–1.18 (m, 2H); ¹³C NMR (75 MHz, CDCl₃) δ 157.3, 154.4, 132.1, 128.9, 128.1, 120.5, 120.3, 120.1, 114.8, 110.4, 70.6, 64.4, 62.4, 59.0, 53.2, 29.6; IR (KBr) ν_{max} 3032, 2922, 1598, 1586, 1485, 1452, 1223, 1110, 1054, 1026 cm⁻¹. Anal. Calcd for C₃₅H₃₆N₂O₄: C, 76.62; H, 6.61. Found: C, 76.80; H, 6.34.

Synthesis of Azetidine 20: Following the general procedure from 40 mg (1.02 mmol) of LiAlH₄, 136 mg (1.02 mmol) of AlCl₃, and 100 mg (0.17 mmol) of *β*-lactam **12**. After 20 min of vigorous stirring, the reaction was quenched and extracted to afford 260 mg (93%) of azetidine **20** as brown oil: ¹H NMR (200 MHz, CDCl₃) δ 7.81 (d, J = 6.8 Hz, 2H), 7.31–7.22 (m, 2H), 7.11–7.04 (m, 6H), 6.81–6.76 (m, 4H), 6.61 (d, J = 7.9 Hz, 4H), 5.44 (d, J = 5.6 Hz, 2H), 4.91 (t, J = 5.4 Hz, 2H), 4.34–4.22 (m, 4H), 3.79–3.71 (m, 2H), 3.61 (d, J = 5.4 Hz, 4H), 3.36 (d, J = 8.4 Hz, 2H); ¹³C NMR (50 MHz, CDCl₃) δ 157.4, 156.0, 129.2, 128.8, 128.2, 125.1, 120.7, 120.5, 115.2, 109.7, 79.5, 71.8, 66.0, 62.2, 53.4, 41.7; IR (KBr) ν_{max} 3028, 2929, 1598, 1589, 1487, 1452, 1257, 1230, 1099, 1072 cm⁻¹. Anal. Calcd for C₃₆H₃₄N₂O₄: C, 71.40; H, 6.13. Found: C, 71.48; H, 6.17.

General Procedure for the Reactions with Li/NH₃: In a threeneck round-bottom flask equipped with an NH₃ condenser and magnetic stirring bar at -78 °C, Na was introduced, and a NH₃ (gas) was injected in the system until 10–20 mL of liquid NH₃ (gas) was injected in the system until 10–20 mL of liquid NH₃ condensed over the Na (the solution turns dark blue). Then, a solution of the β -lactam in dry THF/BuOH was added dropwise via syringe. The mixture was stirred for 5–10 min and quenched with solid NH₄Cl until complete disappearance of the blue color. The crude mixture was kept at room temperature until the NH₃ was evaporated. Then, water was added, and the solution was extracted with CH₂Cl₂. The organic layer was washed with water and brine, dried over MgSO₄, filtered, and the solvent evaporated at reduced pressure. The crude products were purified by flash chromatography in hexane/AcOEt (6:4).

Reaction of β-Lactam 8 with Li/NH₃: About 20 mL of NH₃ was condensed over 10 mg of Na (1.2 mmol). A solution of β-lactam **8** (65 mg, 0.12 mmol) in dry THF (5 mL) with a few drops of 'BuOH was added dropwise to the solution. After 10 min stirring, the reaction was quenched, extracted, and the crude product purified by flash chromatography to yield 40 mg (83%) of macrocycle **21** as pale brown oil: ¹H NMR (200 MHz, CDCl₃) δ 7.20–7.14 (m, 4H), 6.90 (t, *J* = 6.2 Hz, 4H), 5.84 (br s, 2H), 4.38 (s, 4H), 3.22 (dd, *J* = 6, 11.3 Hz, 4H), 2.96 (t, *J* = 7.5 Hz, 4H), 2.44 (t, *J* = 7.5 Hz, 4H), 1.60–1.52 (m, 2H); ¹³C NMR (50 MHz, CDCl₃) δ 172.9, 156.2, 130.1, 129.3, 127.5, 121.0, 111.3, 66.6, 38.4, 36.6, 29.6, 26.5; IR (KBr) ν_{max} 3300, 2923, 1751,1647, 1598, 1550, 1490, 1238, 1132, 1058 cm⁻¹. Anal. Calcd for C₂₃H₂₈N₂O₄: C, 69.67; H, 7.12; N, 7.07. Found: C, 69.95; H, 7.28.

Reaction of β-Lactam 10 with Li/NH₃: About 50 mL of NH₃ was condensed over 20 mg of Na (2.4 mmol). β-Lactam **10** (100 mg, 0.17 mmol) was added over the NH₃ solution with a few drops of 'BuOH. After 10 min stirring, the reaction was quenched, extracted, and the crude purified by flash chromatography to yield 70 mg (88%) of macrocycle **22** as a pale yellow oil: ¹H NMR (300 MHz, CDCl₃) δ 7.18–7.14 (m, 4H), 6.89 (d, J = 7.8 Hz, 2H), 6.79 (dt, $J_1 = 7.5$ Hz, $J_2 = 1.2$ Hz, 2H), 4.27 (t, J = 5.7 Hz, 4H), 4.06 (br s, 2H), 2.98–2.92 (m, 4H), 2.90–2.83 (m, 4H), 2.37 (q, J = 6.0 Hz, 2H) 2.07–2.02 (m, 4H), 1.35–1.30 (m, 2H); ¹³C NMR (75 MHz, CDCl₃) δ 171.5, 156.3, 131.4, 128.7, 127.8, 120.1, 110.6, 62.6, 38.2, 36.8, 29.6, 28.1, 26.1; IR (KBr) ν_{max} 3298, 2925, 1753, 1650, 1596, 1548, 1490, 1236, 1128, 1055 cm⁻¹. Anal. Calcd

for $C_{24}H_{30}N_2O_4{:}\,$ C, 70.22; H, 7.37; N, 6.82. Found: C, 70.08; H, 7.64.
