The concise enantioselective total synthesis of *C*₂-asymmetrical (-)-deoxuscohygrine and (-)-dihydroscoshygrine are described. Double-diastereoselective additions of normal Grignard reagent to bis(1,3-oxazolidine) have been deployed to construct chiral diamine fragments as a key step.

Since (-)-dihydroscoshygrine **1** was isolated from the leaves of *Erythroxylon coca* by Turner in 1981,¹ it has been found distributed in some Erythroxylaceae families.^{2,3} Compound **1** has been inferred from other included alkaloids to be a byproduct in the biosynthesis pathway of tropane alkaloids, but there is no report on its biological activity. Alkaloids having a tropane skeleton, for example, cocaine, atropine, and scopolamine, have some physiological activities that have attracted considerable attention in medicinal chemistry. Coscohygrine, which has frequently been seen in their alkaloids, has some biological activity.⁴ These compounds were found to be *C*₂-symmetrical diamines with a propane side chain attached to two pyrrolidine heterocyclic moieties. In connection with establishing absolute configuration, the only total synthesis of antipode of **1** has been accomplished in nine steps with a 30% overall yield starting from the chiral compound derived from the enzymatic desymmetrization of *meso*-diol.⁵ In this paper, we describe the first total synthesis of naturally occurring (-)-dihydroscoshygrine **1** using a *C*₂-asymmetric approach.

SCHEME 1. Total Retrosynthesis of **1** and **2**

The retrosynthetic plan for dihydroscoshygrine **1** and deoxuscohygrine **2** is outlined in Scheme 1. We envisaged obtaining dihydroscoshygrine and deoxuscohygrine from the *C*₂-symmetrical dipyrrolidine derivatives **3a,b**. Dipyrrolidine **3a,b** could be derived from linear diamines **4a,b** via a ring-closure reaction. The key intermediate **4a,b** is delivered through double-diastereoselective addition of alkylmagnesium bromide **6** to bis(1,3-oxazolidine) **5a,b**, which was expected to establish the requisite asymmetric carbon center. In addition to our work on the synthesis of piperidines⁶ related to the pyrrolidines, we have previously demonstrated that easily available Grignard reagents are especially effective as nucleophiles in double diastereoselective addition to bis(1,3-oxazolidine).⁷ For the synthesis of bis(1,3-oxazolidine) **5a,b** we relied on our development that involves the condensation of *N*-substituted phenylglycine **7** as a chiral auxiliary and dial **8a,b**.

SCHEME 2. Asymmetrical Synthesis of (-)-Deoxocuscohygrine^a

^a Reagents and conditions: (a) 2-[2-(1,3-dioxanyl)]ethylmagnesium bromide (**6**), THF, 60 °C, 92%; (b) HCl, then NaBH₃CN, 65%; (c) Raney Ni, MeOH, then HCl, 56%.

Our first target was deoxocuscohygrine **2**; our aim was to prove the utility of our methodology and also confirm the C₂-symmetrical dipyrrolidine skeleton. The synthesis of compound **2** started from the known bis(1,3-oxazolidine) **5a**,^{7a} which was readily prepared from the enantiomerically pure (*R*)-*N*-2,4,6-trimethoxybenzylphenylglycinol **7** and pentanedial **8a** with no need for chromatographic purification (Scheme 2). Double-diastereoselective addition of nucleophile **6**, prepared in situ from alkyl bromide, to bis(1,3-oxazolidine) **5a** provided the desired diamine **4a** in 95% yield as the sole isolable product. There is nothing surprising to estimate the high diastereoselectivity by our previous reports.^{6–8} It is noteworthy that cleavage of the 2,4,6-trimethoxybenzyl moiety occurred during the addition at 60 °C for 2 d. Subsequent compound **4a** was subjected to acidic cyclization followed by reduction with NaBH₃CN to give the requisite C₂-symmetrical dipyrrolidine **3a** in 65% yield through a two-step sequence. Finally, reductive methylation of a secondary amine with Raney nickel (W-2) in methanol furnished deoxocuscohygrine **2** as dihydrochloride in 56% yield.⁹

Our second target was dihydrocuscohygrine **1**, which we envisioned could be synthesized by a route similar to that described above, introducing oxygen function into dial **8a**. The synthesis of compound **1** began with known alcohol **9** derived from cyclopentadiene.¹⁰ Standard benzyl protection of **9** gave benzyl ether **10** in 83% yield that was dihydroxylated under Tsuji dihydroxylation condition (cat. OsO₄, K₂CO₃, DABCO, K₃Fe(CN)₆ in *t*-BuOH–H₂O) to afford **11** in 73% yield.¹¹ After screening over several reaction conditions, the desired bis(1,3-oxazolidine) **5b** was obtained by one-pot synthesis following condensation of dial **8b**, generated in situ by a NaIO₄ oxidation of diol **11**, with a double portion of amino alcohols **7**. The crude product **5b** was confirmed to be pure by ¹H NMR analysis. The conversion of compound **5b** into dipyrrolidine **3b** was accomplished in a manner analogous to the protocol described in Scheme 2. Thus, double-diastereoselective addition of Grignard reagent **6** to compound **5b** was successfully achieved from

SCHEME 3. Asymmetrical Synthesis of (-)-Dihydrocuscohygrine^a

^a Reagents and conditions: (a) BnBr, NaH, TBAI, 70%; (b) OsO₄, DABCO, K₂CO₃, 74%; (c) NaIO₄, then (*R*)-*N*-(2,4,6-trimethoxybenzyl)phenylglycinol, (d) 2-[2-(1,3-dioxanyl)]ethylmagnesium bromide (**6**), THF, 60 °C, 60% (from **11**); (e) HCl, then NaBH₃CN, 66%; (f) (1) Pd(OH)₂/H₂, (2) 10% HCl, HCHO, then NaBH₃CN, 67%.

compound **11** in three steps with high diastereoselectivity in 60% yield. Simultaneous deprotection of acetal function and annulation by nitrogen concerted an attack under acidic conditions, followed by treatment with NaBH₃CN to afford the desired C₂-symmetrical dipyrrolidine **3b** in 66% yield through a two-step sequence. X-ray structural analysis of compound **3b** unequivocally proved the expected absolute configurations of the new stereogenic centers (see the Supporting Information). Finally, the above reductive methylation of compound **3b** resulted in low yield. This could be circumvented by hydrogenation of the three-benzyl portion with Pd(OH)₂ catalysis, followed by aldimination with HCHO and subsequent NaBH₃CN reduction, leading to the formation of the target dihydrocuscohygrine **1** in 67% yield in three steps. The ¹H NMR spectral data of synthetic product **1** was fully identical with that of natural product **1** and unnatural synthetic product **1**. The magnitude of the optical rotation of our synthetic product **1** [α]_D²⁶ –105.5 (*c* 1.67, CHCl₃) was in strict accordance with that of antipode synthetic product **1** [α]_D²⁰ +105 (*c* 2.05, acetone)⁵ but not that of natural product **1** [α]_D²² –68 (*c* 2.5, acetone).¹

In conclusion, stereoselective total synthesis of C₂-asymmetrical (-)-dihydrocuscohygrine **1** and (-)-deoxocuscohygrine **2** was accomplished starting from (*R*)-phenylglycinol derivative **7**. The key step in the synthesis involved the stereocontrolled construction of the convertible secondary diamines via double-

diastereoselective additions of Grignard reagent to bis(1,3-oxazolidine) and was a highly effective means for preparing C₂-asymmetrical chiral diamines.

Experimental Section

(2R,2'R)-[1,9-Bis(1,3-dioxan-2-yl)nonane-(3S,7S)-diamino]bis(2-phenylethanol) (4a). A solution of **5a** (21.30 g, 30.52 mmol) in THF (150 mL) was treated with a freshly prepared Grignard reagent **6**, derived from 2-(2-bromoethyl)-1,3-dioxane (30.37 mL, 183.12 mmol) and magnesium (7.27 g, 244.16 mmol) in THF (150 mL), heated at 60 °C for 2 d, and allowed to cool to rt. The reaction mixture was quenched with saturated aqueous NH₄Cl solution (200 mL) and extracted with ethyl acetate three times. The combined organic extracts were washed with brine, dried over Na₂SO₄, and concentrated in vacuo. The residue was purified by chromatography (200:10:1 CH₂Cl₂/CH₃OH/NH₄OH) to furnish **4a** (16.52 g, 95%) as a dark yellow gum: [α]_D²⁶ -55.2 (c 3.06, CHCl₃); ¹H NMR (CDCl₃) δ 1.28–1.71 (m, 18H), 1.95–2.13 (m, 2H), 2.44 (m, 2H), 3.01 (br, 2H), 3.40–3.47 (dd, *J* = 9.0, 10.5 Hz, 2H), 3.62–3.68 (dd, *J* = 4.4, 10.5 Hz, 2H), 3.69–3.74 (dt, *J* = 2.1, 11.0 Hz, 4H), 3.78–3.83 (dd, *J* = 4.4, 9.0 Hz, 2H), 4.03–4.09 (dd, *J* = 4.8, 11.0 Hz, 4H), 4.35–4.38 (t, *J* = 4.8 Hz, 2H), 7.23–7.36 (m, 10H); ¹³C NMR (CDCl₃) δ 19.2, 25.7, 29.0, 31.6, 33.5, 53.4, 61.8, 66.8, 66.9, 102.2, 127.3, 127.4, 128.5, 141.3; IR (film) cm⁻¹: 3440, 2930, 2850, 1455, 1140, 700; MS (EI) 570 (M⁺); HRMS calcd for C₃₃H₅₀N₂O₆ 570.3668, found 570.3675.

(1S,3S)-Bis[(2-hydroxy-(1R)-phenethyl)pyrrolidin-2-yl]propane (3a). A solution of **4a** (3.90 g, 6.84 mmol) in CH₃OH (30 mL) was treated with 10% HCl (10 mL), heated to reflux for 3 h, and allowed to cool to rt. The reaction mixture was treated with sodium cyanoborohydride (1.29 g, 20.53 mmol) and stirred for an additional 2.5 h before concentration of CH₃OH. The product was alkalinized with 1 M NaOH and extracted with CH₂Cl₂ three times. The combined organic layers were dried over Na₂SO₄ and concentrated in vacuo. The residue was purified by chromatography (150:10:1 CH₂Cl₂/CH₃OH/NH₄OH) to furnish **3a** (1.88 g, 65%) as a light yellow oil: [α]_D²³ -136.1 (c 2.62, EtOH); ¹H NMR (CDCl₃) δ 1.38–1.88 (m, 14H), 2.16–2.25 (dd, *J* = 8.5, 16.0 Hz, 2H), 2.60–2.63 (m, 2H), 2.87–2.94 (dt, *J* = 2.6, 9.0 Hz, 2H), 3.25 (br, 2H), 3.63–3.68 (dd, *J* = 4.5, 9.4 Hz, 2H), 3.93–4.00 (dd, *J* = 9.4, 10.6 Hz, 2H), 4.03–4.09 (dd, *J* = 4.5, 10.6 Hz, 2H), 7.16–7.39 (m, 10H); ¹³C NMR (CDCl₃) δ 21.9, 22.2, 29.5, 34.2, 45.3, 58.7, 60.9, 62.2, 127.5, 127.9, 129.0, 135.1; IR (film) cm⁻¹: 3410, 3020, 2940, 2880, 1240, 1030, 910; MS (EI) 422 (M⁺); HRMS calcd for C₂₇H₃₇N₂O₂ 421.2855, found 421.2853.

(-)-Deoxuscohygrine (2) Dihydrochloride. A solution of **3a** (357 mg, 0.846 mmol) in CH₃OH (5 mL) was treated with Raney Ni (W-2) (ca. 4 g), heated for refluxing for 16 h, allowed to cool to rt, and concentrated. The product was diluted with 10% HCl (5 mL), washed with ether (10 mL), alkalinized with 1 M NaOH, extracted with CH₂Cl₂ for three times. The combined organic layers were dried over Na₂SO₄, a few drops of saturated hydrogen chloride ethanol solution was added, and the mixture was concentrated in vacuo. The residue was purified by recrystallization with ethyl acetate to furnish **2** dihydrochloride (134 mg, 56%) as a colorless solid: [α]_D²² -14.4 (c 0.56, EtOH); ¹H NMR (CDCl₃) δ 1.52–1.70 (m, 2H), 1.86–2.11 (m, 12H), 2.23–2.32 (m, 2H), 2.84 (m, 6H), 2.91–3.10 (dt, *J* = 8.4, 11.5 Hz, 2H), 3.21–3.40 (m, 2H), 3.66–3.71 (m, 2H); ¹³C NMR (CDCl₃) δ 21.3, 23.2, 29.6, 31.0, 39.2, 56.2, 67.2; IR (film) cm⁻¹: 3390, 2960, 2560, 1460, 1240; MS (EI) 210 (M⁺); HRMS (CI) calcd for C₁₃H₂₉N₂Cl₂ 283.1708, found 283.1685.

4-Benzylloxycyclopentane-1,2-diol (11). A solution of **10** (12.2 g, 71 mmol) in *t*-BuOH (700 mL) was treated with H₂O (700 mL), K₃Fe(CN)₆ (70.0 g, 212 mmol), K₂CO₃ (29.4 g, 212 mmol), 1,4-diazabicyclo[2.2.2]octane (2.10 g, 17.8 mmol), and 5% aqueous OsO₄ (17.6 mL) at rt. After the reaction mixture was stirred for

18 h, the product was quenched with anhydrous sodium sulfite and extracted with ethyl acetate three times. The combined organic phases were washed with brine, dried over Na₂SO₄, and concentrated in vacuo. The residue was purified by chromatography (1:1 ethyl acetate/hexane) to furnish **11** (10.9 g, 73.8%) as an amorphous white solid: ¹H NMR (CDCl₃) δ 2.00 (dd, *J* = 5.3, 5.8 Hz, 4H), 2.96 (br, 2H), 4.14–4.22 (m, 3H), 4.42 (s, 2H), 7.25–7.33 (m, 5H); ¹³C NMR (CDCl₃) δ 37.6, 70.2, 71.9, 76.2, 126.9, 127.0, 127.7, 137.7; IR (film) cm⁻¹: 3400, 3000, 2940, 1600, 1500, 1460, 1350, 1240, 1200, 1170, 1070, 1020, 700; MS (EI) 208 (M⁺); HRMS calcd for C₁₂H₁₆O₃ 208.1099, found 208.1105.

(2R,2'R)-[5-Benzylloxy-1,9-bis(1,3-dioxan-2-yl)nonane-(3S,7S)-diamino]bis(2-phenylethanol) (4b). A solution of **11** (4.41 g, 21.2 mmol) in CH₂Cl₂ (110 mL) and H₂O (22 mL) was treated with sodium periodate (4.53 g, 21.2 mmol) and stirred for 10 min, and *N*-2,4,6-trimethoxybenzylphenylglycinol (12.1 g, 38.16 mmol) was added. The reaction mixture was stirred for 16 h before being separated, dried, and concentrated. The crude product **5b** was unstable and used without further purification: ¹H NMR (CDCl₃) δ 1.83–2.05 (m, 4H), 3.54 (s, 6H), 3.66 (s, 6H), 3.74 (s, 3H), 3.76 (s, 3H), 3.50–3.83 (m, 6H), 3.92–4.07 (m, 5H), 4.40–4.51 (m, 2H), 4.58–4.73 (m, 2H), 5.95 (s, 2H), 6.00 (s, 2H), 7.18–7.44 (m, 15H). A solution of crude **5b** (16.08 g) in THF (90 mL) and Grignard reagent [2-(2-bromoethyl)-1,3-dioxane (27.3 mL, 20.0 mmol) and magnesium (4.86 g, 20.0 mmol) in THF (90 mL)] were reacted at 60 °C for 3 d and worked up as described for **4b** to give **4b** (8.60 g, 60%) as a dark yellow oil: [α]_D²⁶ -55.4 (c 3.10, CHCl₃); ¹H NMR (CDCl₃) δ 1.26–1.62 (m, 14H), 1.99–2.04 (m, 2H), 2.54–2.69 (m, 2H), 3.45 (dd, *J* = 8.4, 10.7 Hz, 2H), 3.61–3.83 (m, 12H), 4.01–4.09 (m, 5H), 4.24 (t, *J* = 4.8 Hz, 1H), 4.29 (t, *J* = 4.8 Hz, 1H), 4.38 (d, *J* = 11.2 Hz, 1H), 4.44 (d, *J* = 11.2 Hz, 1H), 7.20–7.34 (m, 15H); ¹³C NMR (CDCl₃) δ 25.7, 29.4, 29.7, 31.1, 31.1, 39.2, 39.4, 51.6, 51.9, 61.8, 62.3, 66.7, 70.2, 74.3, 102.0, 102.1, 127.1, 127.3, 127.4, 127.8, 128.2, 128.4, 138.4, 141.5, 141.8; IR (film) cm⁻¹: 3440, 3020, 2960, 2940, 2860, 1600, 1500, 1450, 1220, 1140, 750; MS (EI) 676 (M⁺); HRMS calcd for C₄₀H₅₆N₂O₇ 676.4072, found 676.4087.

3-Benzylloxy-(1S,3S)-bis[(2-hydroxy-(1R)-phenethyl)pyrrolidin-2-yl]propane (3b). A solution of **4b** (7.04 g, 10.4 mmol) in CH₃OH (165 mL), 15% HCl (55 mL), and sodium cyanoborohydride (2.62 g, 41.6 mmol) were reacted and worked up as described for **3a** to give **3b** (4.66 g, 85%) as a colorless crystal: mp 122–123 °C (ether/ethyl acetate); [α]_D²⁶ -155.1 (c 0.63, EtOH); ¹H NMR (CDCl₃) δ 1.28–1.78 (m, 10H), 2.05–2.29 (m, 4H), 2.63 (m, 1H), 2.84–2.94 (m, 3H), 3.26 (br, 2H), 3.44 (m, 1H), 3.63–3.70 (m, 2H), 3.94–4.08 (m, 4H), 4.38 (d, *J* = 11.4 Hz, 1H), 4.67 (d, *J* = 11.4 Hz, 1H), 7.16–7.39 (m, 15H); ¹³C NMR (CDCl₃) δ 22.1, 30.3, 30.6, 39.2, 40.4, 45.1, 45.4, 55.6, 56.1, 60.9, 61.2, 62.0, 62.4, 70.8, 75.7, 127.5, 127.6, 127.8, 128.0, 128.2, 128.3, 129.3, 129.4, 135.1, 138.5; IR (film) cm⁻¹: 3100, 2920, 2880, 1600, 1450, 1100, 1060, 740, 700; MS (EI) 528 (M⁺). Anal. Calcd for C₃₄H₄₄N₂O₃: C, 77.23; H, 8.89; N, 5.30. Found: C, 77.01; H, 8.27; N, 5.27. X-ray crystal data: C₃₄H₄₄N₂O₃, *M* = 528.73; monoclinic, space group *P*2₁(#4), *a* = 16.481(4) Å, *b* = 7.997(3) Å, *c* = 11.861(3) Å, β = 105.21(2)°, *V* = 1508.6(7) Å³, *Z* = 2, and *D*_{calc} = 1.16 g/cm³; *R* = 0.050 and *R*_w = 0.057 for 2726 reflections with *I* > 3.00σ(*I*). A crystal of 0.20 × 0.30 × 0.30 mm was used.

Dihydroscoscohygrine (1). A solution of **3b** (115 mg, 0.218 mmol) in CH₃OH (5 mL) was treated with 20% palladium hydroxide on carbon under hydrogen atmosphere for 3 d. The reaction mixture was filtrated with celite pad, and concentrated in vacuo. The residue was diluted with CH₃OH (2 mL), formaldehyde (0.5 mL), and 10% HCl (0.5 mL) before being stirred for 1 h and treated with sodium cyanoborohydride (200 mg, 3.18 mmol) for an additional 30 min. The product was diluted with water, washed with ether at twice, alkalinized with 1 M NaOH, and extracted with CH₂Cl₂ at 5 times. The combined organic phases were dried over Na₂SO₄ and concentrated in vacuo. The residue was purified by chromatography (10:4:1 hexane/CH₂Cl₂/Et₂NH) to furnish **33** mg

(67%) of **1** as colorless oil: $[\alpha]_D^{24} -105.5$ (*c* 1.67, acetone); ^1H NMR (CDCl_3) δ 1.18–1.25 (m, 1H), 1.41–1.48 (m, 2H), 1.71–1.97 (m, 8H), 2.03–2.23 (m, 3H), 2.30–2.39 (m, 7H), 2.59 (m, 1H), 3.04–3.29 (m, 2H), 3.99–4.07 (m, 1H); ^{13}C NMR (CDCl_3) δ 21.9, 23.3, 28.5, 30.8, 36.7, 40.6, 40.7, 42.5, 56.9, 57.0, 63.1, 64.7, 67.1; MS (EI) 226 (M^+); HRMS calcd for $\text{C}_{13}\text{H}_{26}\text{N}_2\text{O}$ 226.2045, found 226.2034.

Acknowledgment. This work was supported in part by a Grant-in-Aid for Scientific Research from the Ministry of

Education, Culture, Sports, Science, and Technology, Japan, and by the Open Research Center Project.

Supporting Information Available: X-ray structure of compound **3b**, NMR spectra for all new compounds synthesized, and CIF file of compound **3b**. This material is available free of charge via the Internet at <http://pubs.acs.org>.
