Received May 28, 2009

Treatment of 3-(2-ethynylphenyl)prop-2-ynyl benzenesulfinate with $2.5 \mathrm{~mol} \%$ of $\left[\mathrm{RhCl}(\mathrm{CO})_{2}\right]_{2}$ at $40{ }^{\circ} \mathrm{C}$ under an atmosphere of CO effected the successive 2,3-sigmatropic rearrangement and carbonylative $[2+2+1]$ ring-closing reaction to afford the 8 -(phenylsulfonyl)-1H-cyclopent $[a]$ -inden-2-one in a high yield. Chemical modification of the ring-closed product via lipase-mediated optical resolution produced the optically active 3-acetoxy-3a-cyclohexyloxy-3,3a-dihydrocyclopent[a]indene skeleton, the core carbon framework of cyanosporasides A and B.

## Introduction

In 2006, Fenical and co-workers ${ }^{1}$ reported the isolation of two structurally novel cyclopent[a]indene glycosides, cyanosporasides A (1) and B (2), from Salinispora pacifica collected at a depth of 500 m in Palau. Cyanosporides A (1) and B (2) have an intriguing novel common structural feature with the 3,3a-dihydrocyclopent $[a]$ indene carbon framework as the aglycon moiety as well as a novel $3^{\prime}$-oxo- $4^{\prime}$ -methyl- $\beta$-fucopyranose as the sugar part. Their biological activity is still uncertain except for the weak cytotoxicity of 1 against human colon carcinoma HCT-116.

We have recently been involved in the investigation of the $\left[\mathrm{RhCl}(\mathrm{CO})_{2}\right]_{2}$ - or $[\mathrm{RhCl}(\mathrm{CO}) \mathrm{dppp}]_{2}$-catalyzed intramolecular carbonylative $[2+2+1]$ ring-closing reaction (Pauson-Khand-type reaction) of phenylsulfonylallenynes, ${ }^{2}$ phenylsulfonylallenenes, ${ }^{3}$ and bis(phenylsulfonylallene) derivatives ${ }^{4}$

leading to the efficient formation of bicyclo[m.3.0] skeletons ( $m=4-6$ ) (Scheme 1). As an extension of our work in this field, we have focused on the synthesis of the carbon framework $\mathbf{3}$ of cyanosporasides A (1) and B (2) by taking advantage of the $\mathrm{Rh}(\mathrm{I})$-catalyzed carbonylative $[2+2+1]$ ring-closing reaction of phenylsulfonylallenynes.

## Results and Discussion

A year before the isolation of $\mathbf{1}$ and $\mathbf{2}$, Liu and Datta ${ }^{5}$ developed the efficient synthesis ( $82 \%$ ) of $1 H$-cyclopent $[a]$ -inden-2-one (5) from 1-ethynyl-2-(1,2-propadienyl)benzene (4) through the $\mathrm{Mo}(\mathrm{CO})_{3}(\mathrm{MeCN})_{3}$-mediated carbonylative $[2+2+1]$ ring-closing reaction at $25^{\circ} \mathrm{C}$ in a stoichiometric manner. They also reported the catalytic version of that transformation in the presence of $5 \mathrm{~mol} \%$ of $\left[\mathrm{RhCl}(\mathrm{CO})_{2}\right]_{2}$

## SCHEME 1. Rh(I)-Catalyzed Pauson-Khand-Type Reaction of Allenes

## SCHEME 2. Carbonylative Ring-Closing Reaction of Allenyne 4

Method A: 1 equiv of $\mathrm{Mo}(\mathrm{CO})_{3}(\mathrm{MeCN})_{3}, \mathrm{MeCN}, 25^{\circ} \mathrm{C}, 8 \mathrm{~h}, 5$ (82\%) Method B: $5 \mathrm{~mol} \%$ of $\left[\mathrm{RhCl}(\mathrm{CO})_{2}\right]_{2}$, toluene, $90^{\circ} \mathrm{C}, 8 \mathrm{~h}$, CO (1 atm), 5 (62\%), 2-methylnaphthalene (8\%)
at $90^{\circ} \mathrm{C}$ to furnish $\mathbf{5}$ in $62 \%$ yield along with the byproduction of 2-methylnaphthalene ( $8 \%$ ), the latter of which should arise from the Myers-Saito cycloaromatization ${ }^{6}$ of 4. They claimed that a low reaction temperature is required to avoid the formation of the undesired 2-methylnaphthalene (Scheme 2).

Thus, this investigation began in order to develop the catalytic procedure for the preparation of the 1 H -cyclopent [a]inden-2-one derivatives without production of 2-methylnaphthalene. According to the previously established met hod, ${ }^{2 e}$ the propargyl alcohol derivative 6 was treated with benzenesulfinyl chloride at $-78^{\circ} \mathrm{C}$ to afford the corresponding sulfinate 7 in a quantitative yield, subsequent exposure of which to $2.5 \mathrm{~mol} \%$ of $\left[\mathrm{RhCl}(\mathrm{CO})_{2}\right]_{2}$ in toluene at $40{ }^{\circ} \mathrm{C}$ under an atmosphere of CO for 10 h effected the successive 2,3-sigmatropic rearrangement and carbonylative $[2+2+1]$ ring-closing reaction of the resulting allenyne species $\mathbf{8}$ to provide 8 -(phenylsulfonyl)-1 H -cyclopent $[a]$ inden-2-one (9) in $81 \%$ yield. The formation of 2-methylnaphthalene could not be detected in the reaction mixture (Scheme 3).

The catalytic preparation of the $1 H$-cyclopent $[a]$ inden-2one skeleton was realized, but the phenylsulfonyl group of 9 might not be essential for the synthesis of the target compound 3. The simpler $1 H$-cyclopent $[a]$ inden-2-one $(5)^{5}$ seemed to be the better substrate for conversion into the $\mathbf{3}$. Therefore, the chemical modification of compound 5 was first examined. Reduction of $\mathbf{5}$ with $\mathrm{NaBH}_{4}$ in the presence of $\mathrm{CeCl}_{3}$ afforded the allyl alcohol 10 in $78 \%$ yield, which was then oxidized with $m$-CPBA to produce the epoxy derivative 11 in $49 \%$ yield. The two trisubstituted olefin moieties of $\mathbf{1 0}$ with a similar reactivity might contribute to the moderate chemical yield of $\mathbf{1 1}$. The Lewis acid-catalyzed ring-opening of an epoxy group ${ }^{7}$ of $\mathbf{1 1}$ in the presence of cyclohexanol unexpectedly furnished 2-hydroxy-1,2,3,8-tetrahydrocyclo-pent[a]inden-3-one (12) in $83 \%$ yield. Although various

[^1]SCHEME 3. Preparation of 9

SCHEME 4. Attempt at Conversion of 5 into 13

conditions were screened, the desired cis-diol derivative $\mathbf{1 3}$ could not be obtained. The formation of $\mathbf{1 2}$ can tentatively be rationalized in terms of the intermediacy of the benzylic cation species 14a $(\mathrm{R}=\mathrm{H})$ followed by hydride transfer ${ }^{8}$ as shown in Scheme 4.

We assumed that the two olefin parts of 8-(phenylsulfo-nyl)-1 $H$-cyclopent $[a]$ inden-2-one ( 9 ) might be differentiated during epoxidation reaction, because one of them has an electron-withdrawing group, whereas the other does not. In addition, the phenylsulfonyl group of 9 would be expected to indirectly suppress the generation of the benzylic cation species (e.g., 14b). As a result, the stereoselective $\mathrm{S}_{\mathrm{N}} 2$-type ring-opening of the epoxy group at the benzylic position may dominate over the hydride transfer reaction via the benzylic cation species 14b. Based on these expectations, we tried to convert 9 into the cis-diol derivatives 17 (Scheme 5). Treatment of 9 with $\mathrm{NaBH}_{4}$ provided the allyl alcohol derivative 15, which was exposed to $m$-CPBA to give the desired 16 in $83 \%$ yield in a highly stereoselctive manner. The highly stereo- and regioselective ring-opening of the epoxy group ${ }^{7}$ of 16 was realized by the reaction of cyclohexanol in the presence of $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$ in methylene chloride at $0{ }^{\circ} \mathrm{C}$ to furnish 17a in $70 \%$ yield. Other alcohols such as allyl alcohol, propargyl alcohol, and methanol also served as good nucleophiles to produce the corresponding diol derivatives $\mathbf{1 7 b} \mathbf{- d}$ in satisfactory yields, the RO groups of which

[^2]
## SCHEME 5. Synthesis of Diol Derivatives 17 from 9

would be converted to a hydroxyl functionality in a later manipulation.

With the required diol derivatives $\mathbf{1 7}$ in hand, a further elaboration was carried out using the cyclohexyloxy derivative 17a (Scheme 6). Acetylation of the diol group under the standard conditions afforded the diacetoxy derivative $\mathbf{1 8}$ in $84 \%$ yield. The phenylsulfonyl group of $\mathbf{1 8}$ was removed by exposure to radical conditions ${ }^{9}$ with ${ }^{n} \mathrm{Bu}_{3} \mathrm{SnH}$ in the presence of AIBN, followed by acid treatment to provide 19 in $66 \%$ yield. The introduction of a double bond between $C_{1}$ and $C_{2}$ remains prior to completion of the preparation of the target structure. Upon treatment with DBU in DMF at $140^{\circ} \mathrm{C}$, compound 19 underwent an E2-type elimination to produce the desired 20, but the chemical yield was rather low ( $24 \%$ ). A more powerful leaving group instead of an acetoxy group would improve the chemical yield. Thus, a multistep conversion of $\mathbf{1 9}$ into $\mathbf{2 0}$ with a higher overall yield was developed. Compound 19 was treated with $\mathrm{K}_{2} \mathrm{CO}_{3}$, and the resulting diol derivative was subsequently monotosylated with TsCl and ${ }^{n} \mathrm{Bu}_{2} \mathrm{SnO}^{10}$ to provide 21 in $86 \%$ yield. DBU treatment of an acetyl derivative, derived from 21, effected E2-type elimination resulting in the easy formation of $\mathbf{2 0}$ in $78 \%$ yield.

As the carbon framework $\mathbf{2 0}$ of $\mathbf{1}$ and $\mathbf{2}$ could be synthesized in a racemic form, the next objective was the preparation of the optically active 20 (Scheme 7). Although the asymmetric reduction of $\mathbf{9}$ was examined under several conditions such as CBS reduction, ${ }^{11}$ Noyori's asymmetric hydrogen transfer reaction, ${ }^{12}$ BINAL reduction, ${ }^{13}$ and Baker's yeast reduction, ${ }^{14}$ and so on, all efforts led to fruitless results. We next attempted the lipase-mediated optical resolution of the alcohol derivative 15. After screening various conditions, treatment of the racemic 15 with lipase AK Amano (Pseudomonas fluorescens) ${ }^{15}$ in isobutyl methyl ketone in the presence

SCHEME 6. Synthesis of 3,3a-Dihydrocyclopent [a]indene 20 from 17a

SCHEME 7. Synthesis of (-)-16

of vinyl acetate as an acetyl donor at $60^{\circ} \mathrm{C}$ provided the best result by producing the chiral acetoxy derivative $\mathbf{2 2}{ }^{16}$ in $43 \%$ yield ( $67 \%$ ee) together with recovery of the chiral $15^{16}$ in $31 \%$ yield ( $82 \%$ ee). In addition to the unsatisfied ee values of both compounds 15 and 22, a fairly easy racemization of the chiral 15 ( $83 \%$ ee to $50 \%$ ee) was observed during its storage for a short time, although the mechanism for the racemization is still uncertain (Scheme 7).

Finally the epoxy alcohol derivative $\mathbf{1 6}$ was found to be a suitable substrate for the optical resolution method (Scheme 7). Indeed, the racemic 16 was exposed to lipase AK Amano ( $P$. fluorescens) ${ }^{15}$ in toluene at $60{ }^{\circ} \mathrm{C}$ in the presence of vinyl acetate to afford (-)-23 in $\mathbf{4 3 \%}$ yield ( $95 \%$ ee) together with ( + )-16 in $44 \%$ yield ( $\geq 99 \%$ ee). The absolute stereochemistry of $(+)-\mathbf{1 6}$ was determined by application of the modified Mosher method. ${ }^{17}$ Calculation of

[^3]the value $[\Delta \delta=\delta(S)-\delta(R)]$ of the $(S)$ - and $(R)$-MTPA esters, ${ }^{18}$ derived from $(+)-\mathbf{1 6}$, in their ${ }^{1} \mathrm{H}$ NMR spectra, confirmed its absolute stereochemistry as shown in Scheme 7. Thus, compound ( - )-23 possessing the required absolute stereochemistry was then hydrolyzed with lipase PS Amano SD (Burkholderia cepacia) ${ }^{19}$ in a mixed solution of acetone and pH 7.0 buffer at $45^{\circ} \mathrm{C}$ to furnish ( - )-16 in $90 \%$ yield. According to the procedures described in Schemes 5 and 6, the optically active alcohol ( - )-16 was converted into (+)-17a, which was subsequently transformed into the final target molecule ( + )-20 through ( + )-18, ( + )-19, and ( + )-21, in turn.

In summary, we have synthesized a 3,3a-dioxygenated-3,3a-dihydrocyclopent $[a]$ indene skeleton, the core carbon framework of cyanosporasides A and B, in an optically active form. The most significant feature of this synthesis involves the previously developed $\mathrm{Rh}(\mathrm{I})$-catalyzed carbonylative ring-closing reaction of an allenyne as the key step. Further studies regarding the total synthesis of cyanosporasides A and B are now in progress.

## Experimental Section

3-(2-Ethynylphenyl)prop-2-ynyl Benzenesulfinate (7). То a solution of $\mathbf{6}(500 \mathrm{mg}, 3.20 \mathrm{mmol})$ and ${ }^{i} \mathrm{Pr}_{2} \mathrm{NEt}(1.67 \mathrm{~mL}, 9.90$ $\mathrm{mmol})$ in THF ( 25 mL ) was added $\mathrm{PhS}(\mathrm{O}) \mathrm{Cl}(566 \mathrm{mg}, 3.52 \mathrm{mmol})$ in THF ( 5 mL ) at $-78^{\circ} \mathrm{C}$. The reaction mixture was stirred for 1 h , quenched by addition of water, and extracted with AcOEt. The extract was washed with water and brine, dried, and concentrated to dryness. The residue was chromatographed with hexane $-\operatorname{AcOEt}(5: 1)$ to afford $7(905 \mathrm{mg}$, quant) as a pale yellow oil: IR 3308, 1479, $1445 \mathrm{~cm}^{-1}{ }^{1}{ }^{1} \mathrm{H}$ NMR $\delta 7.81-7.79(\mathrm{~m}, 2 \mathrm{H})$, $7.56-7.48(\mathrm{~m}, 4 \mathrm{H}), 7.40(\mathrm{dt}, 1 \mathrm{H}, J=9.4,3.8 \mathrm{~Hz}), 7.31-7.27(\mathrm{~m}$, $2 \mathrm{H}), 4.91(\mathrm{~d}, 1 \mathrm{H}, J=15.8 \mathrm{~Hz}), 4.64(\mathrm{~d}, 1 \mathrm{H}, J=15.8 \mathrm{~Hz}), 3.28$ (s, $1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\delta$ 144.3, 132.6, 132.4, 132.2, 129.1, 128.5, 128.4, 125.4, 124.9, 124.8, 86.8, 86.1, 81.7, 81.3, 52.8; MS m/z $280\left(\mathrm{M}^{+}\right.$, 48.5); HRMS calcd for $\mathrm{C}_{17} \mathrm{H}_{12} \mathrm{O}_{2} \mathrm{~S} 280.0558$, found 280.0557.

8-(Phenylsulfonyl)-1 H -cyclopent[a]inden-2-one (9). To a solution of $7(905 \mathrm{mg}, 3.23 \mathrm{mmol})$ in toluene $(30 \mathrm{~mL})$ was added $\left[\mathrm{RhCl}(\mathrm{CO})_{2}\right]_{2}\left(31.4 \mathrm{mg}, 8.08 \times 10^{-3} \mathrm{mmol}\right)$ at room temperature. The reaction mixture was stirred at room temperature under CO atmosphere for 4 h . The reaction mixture was concentrated and chromatographed with hexane-AcOEt (8:1) to afford 9 (810 $\mathrm{mg}, 81 \%$ ) as yellow needles: $\mathrm{mp} 186-187^{\circ} \mathrm{C}$ (AcOEt); IR 1720 , $1607,1323 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\delta 8.04(\mathrm{~d}, 2 \mathrm{H}, J=8.3 \mathrm{~Hz}), 7.68-7.55$ $(\mathrm{m}, 5 \mathrm{H}), 7.43(\mathrm{t}, 1 \mathrm{H}, J=7.7 \mathrm{~Hz}), 7.26-7.25(\mathrm{~m}, 1 \mathrm{H}), 6.76(\mathrm{~s}, 1 \mathrm{H})$, 3.45 (s, 2H); ${ }^{13} \mathrm{C}$ NMR $\delta$ 203.9, 167.4, 150.1, 141.9, 140.6, 134.0. 133.6, 132.8, 129.6, 129.5, 129.3, 127.5, 126.9, 126.0, 121.9, 35.8; MS $m / z 308\left(\mathrm{M}^{+}, 57.9\right)$. Anal. Calcd for $\mathrm{C}_{18} \mathrm{H}_{12} \mathrm{O}_{3} \mathrm{~S}: \mathrm{C}, 70.11 ; \mathrm{H}$, 3.92. Found: C, 69.99, H, 3.97.

8-(Phenylsulfonyl)-1,2-dihydrocyclopent[a]inden-2-ol (15). To a solution of $\mathbf{9}(120 \mathrm{mg}, 0.390 \mathrm{mmol})$ in THF $(4 \mathrm{~mL})$ was added a mixture of $\mathrm{NaBH}_{4}(37.1 \mathrm{mg}, 0.975 \mathrm{mmol})$ and $\mathrm{CeCl}_{3} \cdot 7 \mathrm{H}_{2} \mathrm{O}$ $(400 \mathrm{mg}, 1.05 \mathrm{mmol})$ in $\mathrm{MeOH}(2 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. The reaction mixture was stirred for 3 h , quenched by addition of water, and extracted with AcOEt. The extract was washed with water and brine, dried, and concentrated to dryness. The residue was chromatographed with hexane $-\mathrm{Et}_{2} \mathrm{O}$ (1:2) to afford 15 (77.7 $\mathrm{mg}, 64 \%)$ as yellow plates: $\mathrm{mp} 190-191{ }^{\circ} \mathrm{C}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$; IR 3587 , $1317,1151 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\delta 8.03-8.01(\mathrm{~m}, 2 \mathrm{H}), 7.65(\mathrm{~d}, 1 \mathrm{H}, J=$ $7.8 \mathrm{~Hz}), 7.60-7.56(\mathrm{~m}, 2 \mathrm{H}), 7.53-7.50(\mathrm{~m}, 2 \mathrm{H}), 7.34-7.31(\mathrm{~m}, 1 \mathrm{H})$, $7.21-7.18(\mathrm{~m}, 1 \mathrm{H}), 6.97(\mathrm{~d}, 1 \mathrm{H}, J=2.4 \mathrm{~Hz}), 5.48-5.45(\mathrm{~m}, 1 \mathrm{H})$,
