[AB](#page-3-0)STRACT: [A variety of re](#page-3-0)adily available 1-mercapto-3-yn-2 ols 5 were conveniently converted into the corresponding thiophenes 6 in good to high yields in MeOH as the solvent at 50−100 °C in the presence of catalytic amounts (1−2%) of PdI₂ in conjunction with KI (KI:PdI₂ molar ratio = 10). The catalyst could be made recyclable employing an ionic liquid, such as $BmimBF_4$, as the solvent under suitable conditions.

Metal-catalyzed heterocyclodehydration of unsaturated
substrates bearing a suitably placed nucleophilic group is a powerful methodology for the direct and atom-economical synthesis of heterocycles starting from readily available starting materials under essentially neutral conditions. $1,2$ In this field, we have contributed several examples, 2 including the synthesis of quinolines from 1-(2-aminoaryl)-2-yn-1-ols^{[2f](#page-4-0)[−](#page-4-0)h} and the synthesis of benzothiophenes from 1[-\(](#page-4-0)2-mercaptophenyl)-2-yn-1 $ols.^{2c}$

A particularly attractive process, recently developed by sev[era](#page-4-0)l research groups,^{1b-e, \tilde{g} ,j^{-l} including ours,^{2d} consists in} the formation of substituted furans 2 and pyrroles 4 by heterocyclodehydration [of](#page-4-0) [3-yne](#page-4-0)-1,2-diols 1 and [1-](#page-4-0)amino-3-yn-2-ol derivatives 3, respectively, as shown in Scheme 1. On the other hand, the analogous process starting from 1-mercapto-3 yn-2-ols 5 to obtain substituted thiophenes 6 has bee[n](#page-1-0) reported in the literature in only one example, concerning the Au/Agcatalyzed conversion of 1-mercapto-4-phenylbut-3-yn-2-ol to 2 phenylthiophene.^{1c} In this work, we report a general method for the catalytic conversion of 1-mercapto-3-yn-2-ols 5 to substituted thiop[he](#page-4-0)nes $6^{3,4}$ based on the use of a very simple catalytic system, consisting of PdI_2 in conjunction with an excess of KI, under neut[ral](#page-4-0) and mild reaction conditions.

We began our investigation with 2-mercapto-3-methylnon-4 yn-3-ol 5a, which was initially allowed to react in MeOH (substrate concentration $= 0.2$ mmol of 5a per mL of MeOH) at 80 °C in the presence of PdI₂ (1 mol %) and KI (10 mol %). After 2 h, analysis of the reaction mixture evidenced the formation of the desired 5-butyl-2,3-dimethylthiophene 6a in 77% GLC yield. We then screened the reaction parameters, in order to find the optimal conditions for the preparation of 6a. The specific results are reported in the Supporting Information (Table S1). From this brief optimization study, we found the best reaction conditions in term of yield of 6a, which corresponded to the use of $PdI_2 + 10KI$ as the catalyst, in MeOH as the solvent at 50 \degree C, with a substrate concentration of 0.5 mmol of 5a per mL of MeOH. Under these optimized conditions, the reaction after 3 h led to the formation of 6a in 88% isolated yield (Table 1, entry 1). The reaction was then applied to other differently substituted 1-mercapto-3-yn-2-ols 5b−i (Table 1, entries 2−[9\)](#page-1-0).

The results reported in Table 1 illustrate that the $R³$ substituent c[ou](#page-1-0)ld be an alkyl as well an aryl group and that the heterocyclodehydration process [w](#page-1-0)as slower when the $R³$ group was an aromatic ring substituted with an electronreleasing group at the para position (as in the case of 4 mercapto-3-methyl-1-p-tolylpent-1-yn-3-ol 5c, entry 3) or a πexcessive heteroaromatic substituent (as in the case of 4 mercapto-3-methyl-1-(thiophen-3-yl)pent-1-yn-3-ol 5e, entry 5). On the other hand, a para-electron-withdrawing group on $R³$ caused an augmentation of the reaction rate, as shown by the results obtained with 4-mercapto-3-methyl-1-(4-nitrophenyl) pent-1-yn-3-ol 5d (entry 4). These results show that the heterocyclodehydration process is quite sensitive to the electrophilicity of the coordinated triple bond undergoing the intramolecular nucleophilic attack by the mercapto group, which leads to the formation of a vinylpalladium species as intermediate I (Scheme 2; anionic iodide ligands are omitted for clarity). The latter then undergoes protonolysis followed by dehydration or vice ve[rs](#page-2-0)a to give the final product with regeneration of PdI₂ (Scheme 2). When $R¹$ was hydrogen, as in the case of 1-mercapto-4-phenylbut-3-yn-2-ol 5f, longer reaction times were require[d,](#page-2-0) and the product yield was

Table 1. Synthesis of Substituted Thiophenes 6 by PdI₂/KI-Catalyzed Heterocyclodehydration of 1-Mercapto-3-yn-2-ols 5 in $MeOH^a$

a
All heterocyclodehydration reactions were carried out in MeOH as the solvent (0.5 mmol of starting thiol 5 per mL of MeOH) in the presence of PdI₂ and KI (KI:PdI₂ molar ratio = 10). Conversion of thiol 5 was quantitative. ^bIsolated yield based on starting thiol 5. Cubstrate conversion was 74%.

somewhat lower (Table 1, entry 6). This result clearly shows that the reactive rotamer effect^{5,6} is at work under our conditions.

We also tested the reactivity o[f 1](#page-4-0)-mercapto-2,2-dialkynyl-2 ols 5g−i, bearing an additional alkynyl substituent at C-2. The results, reported in Table 1, entries 7−9, show that these substrates could be converted into the corresponding thiophenes 6g−i in good yields without affecting the alkynyl substituent. As expected in view of the reactive rotamer effect, a substrate lacking an alkyl substituent at C-1, such as 7-

Scheme 2. Proposed Mechanism for the PdI_2/KI -Catalyzed Heterocyclodehydration of 1-Mercapto-3-yn-2-ols 5 to Substituted Thiophenes 6

(mercaptomethyl)trideca-5,8-diyn-7-ol 5h, was less reactive than 1-mercapto-2,2-dialkynyl-2-ols 5g and 5i, bearing a secondary thiol group.

In order to verify the possibility to recycle the catalytic system, we also carried out the heterocyclodehydration reaction of 5 in an ionic liquid (IL) as the solvent.⁷ We chose mercaptoalkynol 5b as model substrate for testing the feasibility of the process in an IL. The results obtained [by](#page-4-0) employing some ILs, with 1 mol % of catalyst at 80 °C for 24 h and with a substrate concentration of 0.2 mmol of 5b per mL of IL, are shown in the Supporting Information (Table S2). The best result in terms of product yield (82%) was obtained with BmimBF4, whi[ch was accordingly chos](#page-3-0)en as the reference IL solvent for the next experiments, aimed at assessing the recyclability of the catalyst-IL system. The results of these experiments, reported in the Supporting Information (Table S3), show that the catalyst-IL system could be recycled sixth times with comparable yields i[n several examples.](#page-3-0)

In conclusion, we have reported a convenient and general method for the heterocyclodehydration of readily available 1 mercapto-3-yn-2-ols 5 to substituted thiophenes 6. The process is catalyzed by a simple catalytic system, consisting of $PdI₂$ in conjunction with an excess of KI, under mild reaction conditions (MeOH as the solvent at 50−80 °C) and can be applied to a variety of substrates, including 1-mercapto-2,2 dialkynyl-2-ols. The latter were converted into the corresponding thiophene derivatives without affecting the additional alkynyl substituent, which would allow further functionalization at the thiophene ring. Moreover, the catalytic method has been made recyclable using a suitable ionic liquid as the solvent, such as $BmimBF_4$.

EXPERIMENTAL SECTION

General Experimental Methods. Melting points are uncorrected. ¹H NMR and ¹³C NMR spectra were recorded at 25 °C in CDCl₃ solutions at 300 and 75 MHz, respectively, with $Me₄Si$ as an internal standard. Chemical shifts (δ) and coupling constants (J) are given in ppm and Hz, respectively. IR spectra were taken with an FT-IR spectrometer. Mass spectra were obtained using a GC−MS apparatus at 70 eV ionization voltage. All reactions were analyzed by TLC on silica gel 60 F_{254} or on neutral alumina and by GLC using a gas chromatograph and capillary columns with polymethylsilicone + 5% phenylsilicone as the stationary phase. Column chromatography was performed on silica gel 60 (70−230 mesh). Evaporation refers to the removal of solvent under reduced pressure.

Preparation of 1-Mercapto-3-alkyn-2-ols 5a−f. Substrates 5a, 5b, 5c, and 5e were prepared as we previously reported.⁸ 1-Mercapto-4-phenylbut-3-yn-2-ol 5f was prepared as described in the literature.^{1c} 4-Mercapto-3-methyl-1-(4-nitrophenyl)pent-1-yn-3-ol [5](#page-4-0)d was prepared as described below.

Preparation of 4-Mercapto-3-methyl-1-(4-nitrophenyl)pent-1-y[n-](#page-4-0)3-ol (5d). To a cooled (-78 °C), stirred solution of BuLi (1.6 M in hexane) (28 mL, 44.8 mmol) in anhydrous THF (16 mL), maintained under nitrogen, was added dropwise a solution of p -nitrophenylacetylene (6.55 g, 44.5 mmol) in anhydrous THF (6 mL). To the resulting mixture was added, at the same temperature under nitrogen, a solution of LiBr (1.56 g, 18 mmol) in anhydrous THF (6 mL). After additional stirring for 0.5 h, a solution of 3-mercapto-2-butanone (1.77 g, 17.0 mmol) in anhydrous THF (5 mL) was added, at the same temperature under nitrogen. The resulting mixture was stirred for additional 2 h at −78 °C and then allowed to warm to room temperature. Saturated NH₄Cl (20 mL) and 1 N HCl (10 mL) were added, and the mixture was extracted with Et₂O (3 \times 50 mL). The collected organic phases were washed with brine (40 mL) and dried over $Na₂SO₄$. After filtration and evaporation of the solvent, the crude product was purified by column chromatography using 95:5 hexane/ AcOEt as eluent, to give pure 5d as a mixture of diastereoisomers A + B, A:B ratio = 3.0, determined by ¹H NMR. Yield: 4.06 g, starting from 1.77 g of 3-mercapto-2-butanone (95%). Yellow oil. IR (film) ν 3393 (m, br), 2975 (m), 2930 (m), 2870 (w), 2566 (vw), 2197 (vw), 1592 (m), 1510 (m), 1342 (s), 1108 (m), 854 (m), 752 (w) cm⁻¹; ¹H NMR (300 MHz, CDCl₃) δ 8.28–8.21 [B (m, 2 H)], 8.17–8.09 [A (m, 2 H)], 7.65−7.59 [A (m, 2 H)], 7.55−7.49 [B (m, 2 H)], 4.11 [B (q, J = 7.2, 1 H)], 3.77 $[A (q, J = 7.0, 1 H)]$, 1.47 $[A (d, J = 7.0, 3 H)]$, 1.44 $[A (s, 3 H) + B (s, 3 H)], 1.42 [B (distorted d, J = 7.2, 3 H)], 1.26 [B]$ $(d, J = 7.2, 1 \text{ H})$], 1.24 [A (d, J = 7.0, 1 H)]; ¹³C NMR (75 MHz, CDCl3) δ 143.1, 140.4, 130.7, 129.2, 127.0, 126.6, 123.65, 123.59, 86.7, 84.2, 56.9, 55.2, 23.6, 18.6, 14.8, 12.3; GC−MS m/z 251 (absent) [M⁺], 234 (14), 233 (100), 218 (56), 203 (11), 186 (14), 172 (36), 171 (36), 153 (12), 152 (11), 128 (9), 115 (13). Anal. Calcd for C₁₂H₁₃NO₃S (251.30): C, 57.35; H, 5.21; N, 5.57; S, 12.76. Found: C, 57.41; H, 5.20; S, 12.74.

Preparation of 1-Mercapto-2,2-dialkynyl-2-ols 5g−i. Substrates $5h$ and $5i$ were prepared as we already reported.⁸ 7-(1-Mercaptoethyl)trideca-5,8-diyn-7-ol 5g was prepared as described below.

Preparation of 7-(1-Mercaptoethyl)trideca-5,8-diyn-7-ol [5g](#page-4-0). To a suspension of Mg turnings (0.6 g, 24.7 mmol) in anhydrous THF (3 mL), maintained under nitrogen at reflux was added pure ethyl bromide (0.8 mL) to start formation of the Grignard reagent. The remaining bromide was added dropwise in THF solution (2.0 mL of EtBr in 5 mL of THF; total amount of EtBr added, 4.09 g, 37.5 mmol). The mixture was then allowed to reflux for an additional 20 min. After cooling, the resulting solution of EtMgBr was transferred under nitrogen to a dropping funnel and added dropwise under nitrogen to a solution of 1-hexyne (3.27 g, 39.8 mmol) in anhydrous THF (6 mL) at 0 °C with stirring. After additional stirring at 0 °C for 15 min, the mixture was allowed to warm to room temperature and then was heated at 45 °C and stirred for 2 h. To the hot solution of the 1 hexynylmagnesium bromide thus obtained was added, dropwise and under nitrogen, a solution of ethyl 2-mercaptopropanoate (1.33 g, 9.94 mmol) in anhydrous THF (5 mL). The resulting mixture was allowed to stir at 45 °C for 2 h. After cooling to room temperature, saturated aqueous NH₄Cl (50 mL) and Et₂O (40 mL) were sequentially added, the phases were separated, and the aqueous phase was extracted with Et₂O (3 \times 50 mL). The collected organic layers were washed with brine and dried over $Na₂SO₄$. After filtration and evaporation of the solvent, product 5g was purified by column chromatography on silica gel using 95:5 hexane/AcOEt as the eluent. Yield: 1.13 g, starting from 1.33 g of ethyl 2-mercaptopropanoate (45%). Yellow oil. IR (film) ν 3426 (m, br), 2957 (m), 2930 (m), 2231 (w), 1458 (m), 1251 (w), 1157 (w), 1041 (m) cm⁻¹; ¹H NMR (300 MHz, CDCl₃) δ 3.21−3.08 $(m, 1 H)$, 2.27 $(t, J = 6.9, 2 H)$, 2.25 $(t, J = 6.9, 2 H)$, 1.87 $(d, J = 8.5, 1 H)$ H), $1.60-1.35$ (m, 8 H), 1.51 (d, $J = 6.9$, 3 H), 0.92 (t, $J = 7.3$, 3 H), 0.91 (t, J = 7.3, 3 H); ¹³C NMR (75 MHz, CDCl₃) δ 85.7, 85.2, 79.2, 78.1, 67.8, 47.8, 30.5, 30.4, 22.0, 20.4, 18.4, 13.6; GC−MS m/z 252 (absent) [M+], 236 (3), 192 (18), 191 (100), 190 (10), 161 (12), 148 (8), 147 (13), 135 (11), 128 (14), 115 (25), 107 (14), 103 (13), 93 (12), 92 (13), 91 (49), 80 (11), 77 (40). 2-Phenylthiophene (6f).^{1c} Yield: 80 mg, starting from 178 mg of 5f (50%) (Table 1, entry 6). Yellow solid, mp = 34–35 °C, lit.^{1c} 33–34 °C. IR (KBr) ν 2924 (m)[, 1](#page-4-0)600 (m), 1446 (m), 1072 (m), 755 (s), 693 (s) cm[−]¹ ; 1 H NMR (300 MHz, CDCl3) δ 7.63−7.54 [\(m](#page-4-0), 2 H), 7.39−7.20 (m[,](#page-1-0) 5 H), 7.07−7.01 (m, 1 H); 13C NMR (75 MHz,

CDCl₃) δ 144.4, 134.4, 128.9, 128.0, 127.4, 125.9, 124.8, 123.1; GC– MS m/z 160 (100) [M⁺], 128 (15), 115 (42), 102 (7), 89 (10), 77 (6), 63 (8). Anal. Calcd for $C_{10}H_8S$ (160.24): C, 74.96; H, 5.03; S, 20.01. Found: C, 74.98; H, 5.01; S, 20.01.

5-Butyl-3-hex-1-ynyl-2-methylthiophene (6g). Yield: 200 mg, starting from 252 mg of 5g (85%) (Table 1, entry 7). Yellow oil. IR $(\text{film}) \nu 2964$ (s), 2931 (s), 2859 (m), 2360 (vw), 1465 (m), 1378 (w), 832 (m) cm⁻¹; ¹H NMR (300 MHz, CDCl₃) δ 6.56 (s, 1 H), 2.66 $(t, J = 7.5, 2 H)$, 2.42 $(s, 3 H)$, 2.39 $(t, J = 6.9, 2 H)$ $(t, J = 6.9, 2 H)$ $(t, J = 6.9, 2 H)$, 1.65−1.28 $(m, 8$ H), 0.94 (t, $J = 7.3$, 3 H), 0.91 (t, $J = 7.3$, 3 H); ¹³C NMR (75 MHz, CDCl3) δ 141.4, 139.6, 126.3, 119.7, 91.7, 75.5, 33.6, 31.1, 29.6, 22.1, 22.0, 19.2, 14.2, 13.8, 13.7; GC−MS m/z 234 (19) [M⁺], 205 (4), 191 (100), 177 (8), 161 (16), 147 (42), 128 (14), 115 (31), 103 (9), 91 (16), 77 (12). Anal. Calcd for $C_{15}H_{22}S$ (234.40): C, 76.86; H, 9.46; S, 13.68. Found: C, 76.88; H, 9.45; S, 13.67.

2-Butyl-4-hex-1-ynylthiophene (6h). Yield: 115 mg, starting from 238 mg of 5h (52%) (Table 1, entry 9). Yellow oil. IR (film) ν 2923 (s), 2853 (m), 2205 (vw), 1442 (m), 1384 (m), 752 (s), 686 (m) cm⁻¹; ¹H NMR (300 MHz, CDCl₃) δ 7.10 (d, J = 1.2, 1 H), 6.74−6.72 $(m, 1 H)$, 2.74 (td, J = 7.5, 0.[9,](#page-1-0) 2 H), 2.36 (t, J = 7.0, 2 H), 1.68–1.29 $(m, 8 H)$, 0.93 (t, J = 7.3, 3 H), 0.91 (t, J = 7.3, 3 H); ¹³C NMR (75 MHz, CDCl₃) δ 145.3, 126.8, 125.2, 122.3, 89.0, 76.1, 33.6, 30.9, 29.6, 22.1, 22.0, 19.1, 13.8, 13.7; GC−MS m/z 220 (45) [M⁺], 205 (12), 191 (5), 177 (100), 163 (16), 147 (10), 135 (29), 115 (11), 91 (13), 77 (9). Anal. Calcd for C₁₄H₂₀S (220.37): C, 76.30; H, 9.15; S, 14.55. Found: C, 76.32; H, 9.14; S, 14.54.

2-Methyl-5-phenyl-3-phenylethynylthiophene (6i). Yield: 233 mg, starting from 292 mg of 5i (85%) (Table 1, entry 8). Yellow solid, mp = 124−125 °C. IR (KBr) ν 2957 (s), 2931 (s), 2872 (m), 2234 (vw), 1466 (m), 835 (m), 738 (m), 629 (w) cm⁻¹; ¹H NMR (300 MHz, CDCl₃) δ 7.57–7.49 [\(](#page-1-0)m, 4 H), 7.39–7.23 (m, 7 H), 2.59 (s, 3 H); ¹³C NMR (75 MHz, CDCl₃) δ 143.0, 140.3, 133.9, 131.4, 128.9, 128.4, 128.1, 127.5, 125.5, 125.1, 123.4, 120.7, 91.6, 84.1, 14.6; GC−MS m/z 274 (86) [M+], 258 (19), 239 (40), 215 (19), 197 (46), 187 (22), 171 (28), 163 (22), 152 (50), 139 (27), 121 (31), 102 (26), 89 (39), 77 (100). Anal. Calcd for $C_{19}H_{14}S$ (274.38): C, 83.17; H, 5.14; S, 11.69. Found: C, 83.15; H, 5.15; S, 11.70.

Preparation of lonic Liquids. Ionic liquids $BmimNTf_2^{11}$ and BmimOTf¹² were prepared according to literature procedures. All other ionic liquids were prepared as we previously described.²¹

Gener[al](#page-4-0) Procedure for the Recyclable PdI2-Cat[aly](#page-4-0)zed Heterocyclodehydration of 1-Mercapto-2,2-dialkynyl-[2-](#page-4-0)ols 5 to Thiophenes 6 in BmimBF₄. To a solution of $5(0.4 \text{ mmol})$ ($5b$, 83 mg; 5e, 85 mg; 5g, 101 mg; 5h, 95 mg) in BmimBF4 (2 mL) were added PdI₂ (1.5 mg, 4.2 × 10⁻² mmol) and KI (6.9 mg, 4.2 × 10⁻¹ mmol) in this order under nitrogen in a Schlenk flask. The mixture was allowed to stir at 80 °C for 24 h. After cooling, the product was extracted with Et₂O (6×4 mL), and the residue (still containing the catalyst dissolved in the ionic liquid) was used as such for the next recycle (see below). The collected ethereal phases were concentrated, and products were purified as detailed in the general procedure in MeOH (see above). The isolated yields obtained in each experiment are reported in Table S3 (Supporting Information).

Recycling Procedure. To the residue obtained as described above, still containing the catalyst dissolved in the ionic liquid, was added a solution of 5 (0.4 mmol) in Et₂O (4 mL). Et₂O was removed under vacuum, and then the same procedure described above was followed.

Organometallics 2001, 20, 1259−1275. (g) Roncali, J. Chem. Rev. 1992, 92, 711−738.

(4) For some very recent examples of synthesis of thiophene derivatives by heterocyclization of acyclic precursors, see: (a) Mishra, P.; Maurya, H. K.; Tandon, V. K.; Kumar, B.; Ram, V. J. Tetrahedron Lett. 2012, 53, 1056−1059. (b) Teiber, M.; Mueller, T. J. J. Chem. Commun. 2012, 48, 2080−2082. (c) Robertson, F. J.; Wu, J. J. Am. Chem. Soc. 2012, 134, 2775−2780.

(5) This effect, causing a higher reactivity with 1,2-dialkyl substituted substrates, is associated with the relief of the unfavorable steric repulsion between the alkyl substituents at C-2 and C-3 going through the transition state leading to cyclization and also the fact that the steric effect exerted by the alkyl substituents tends to increase the population of the rotamer in which the mercapto group and the triple bond are closer to each other.⁶

(7) The use of ILs in organic synthesis has recently attracted great attention, due to the very important characteristics of these nonconventional solvents: they are stable, nonflammable, nonvolatile, and recyclable and in some cases may even promote organic reactions. For recent reviews, see: (a) Patel, D. D. Chem. Rec. 2012, 12, 329− 355. (b) Wong, W.-L.; Wong, K.-Y. Can. J. Chem. 2012, 90, 1−16. (c) Payagala, T.; Armstrong, D. W. Chirality 2012, 24, 17−53.
