S Supporting Information

ABSTRACT: Synthesis of isatin and iodoisatin from 2′-aminoacetophenone was achieved via oxidative amido cyclization of the sp³ C−H bond using I₂−TBHP as the catalytic system. The reaction proceeds through sequential iodination, Kornblum oxidation, and amidation in one pot. This method is simple, atom economic, and works under metal- and base-free conditions.

■ INTRODUCTION

Domino reactions are widely employed in organic synthesis due to high atom economy, minimum waste generation, and construction of complex molecules through two or more bond formations in one $pot.$ ¹ Recently, the focus has been on application of unimolecular domino reactions for the construction of frame[wo](#page-6-0)rks which are hitherto difficult.² Since toxic and expensive metal catalysts 3 are used, the advantages of domino reaction are overshadowed, and henc[e,](#page-6-0) the development of environmentally benign domino process become highly desirable.

The isatin skeleton is ubiquitous and found among scores of natural products,⁴ synthetic intermediates, 5 and bioactive compounds.⁶ The versatility of isatin as a synthetic intermediate is due to the reac[ti](#page-6-0)vity of $N(1)-H⁷ C(3)=O⁸$ $N(1)-H⁷ C(3)=O⁸$ $N(1)-H⁷ C(3)=O⁸$ and aromatic C−H functi[o](#page-6-0)nal groups. Because of its extensive application as a crucial chemical block, different m[et](#page-6-0)hods, base[d](#page-6-0) on inter- and intramolecular reactions, were reported. The intermolecular approaches include regioselective ortho acylation of anilines with suitable carbonyl precursors, a Pd-catalyzed double carbonylation of 2-haloanilides,^{9b} CsF-mediated reaction of arynes with methyl 2-oxo-2-(arylamin[o\)](#page-6-0)acetates (Scheme 1, eq 1 , 9^{9c} and [yl](#page-6-0)ide-mediated carbonyl homologation and oxidation of an[th](#page-1-0)ranilic acid (Scheme 1, eq 2). 3d However, these pr[oce](#page-6-0)dures are associated with some drawbacks, such as harsh conditions, $9a$ use of expensive [Pd](#page-1-0) catalyst, $9b$ nonregioselective, limited substrate scope, and most importantly, non-atom economy a[s o](#page-6-0)nly a part of the reagent use[d fo](#page-6-0)r the introduction of carbonyl group is retained.⁹ To overcome the regioselective and atom-economic issues, a few novel unimolecular domino procedures have been devel[op](#page-6-0)ed recently. These are $CeCl₃$. $7H_2O/IBX$ -promoted oxidation of 3-alkylindoles,^{10a} Pd-catalyzed annulation of 2-(2-haloethynyl)-1-nitrobenzenes,^{10b} $CuCl₂-catalyzed$ oxidative acylation of formyl-N-[aryl](#page-6-0)formami-

des,^{10c} CuI-promoted cyclization of 2-bromoarylacetamides^{10d} and CuI-, 10e or Cu(OAc)₂·H₂O-, 10f or SeO₂-mediated^{10g} oxi[dati](#page-6-0)ve amidation of 2′-N-alkyl/arylaminoacetopheno[nes.](#page-6-0) The need [for](#page-6-0) inaccessible starting [mat](#page-6-0)erials,^{10b−d} high boil[ing](#page-6-0)
solvent (140 °C)^{10e} and harmful reggents such as SoO^{10g} solvent (140 °C),^{10e} and harmful reagents such as $SeO₂$ ¹ makes these methods still less attractive. In [addit](#page-6-0)ion, some of [the](#page-6-0) methods either failed^{10e−g} or did not study the acetophenones with $2'$ -NH₂ or $2'$ -N-amido and $2'$ -tertiary aniline groups.10f

On the other hand, iodoisatins are important intermediates and frequently [us](#page-6-0)ed in the synthesis of bioactive arylanthranilic acids.¹¹ There are only few isolated reports on the synthesis of iodoisatins using special reagents such as $KICl₂−H₂O$, 2 days,¹² ICl–[Me](#page-6-0)OH, 5 $h¹³$ IPy₂BF₄–CF₃COOH, 40 min,¹⁴ and NIS– TfOH,¹⁵ usually under strong acidic conditions. Thus, there i[s a](#page-6-0) significant need [t](#page-6-0)o develop a versatile, con[ven](#page-6-0)ient, and econo[mi](#page-6-0)c method for the synthesis of isatin derivatives.

In the presence of a co-oxidant, molecular iodine works efficiently as an oxidant in catalytic quantity and it is environmentally benign compared to metal catalysts.¹⁶ While a number of C−C bond-forming domino reactions are reported using iodine, there are only a few corresponding $C-X$ (X = heteroatom) bond-forming processes.¹⁷ Herein, we describe an efficient and metal-free synthesis of isatin and iodoisatin derivatives, starting from either $2'$ -NH₂ or $2'$ -NH-alkyl or $2'$ -N,N-dialkyl or 2′-NH-amidoacetophenones, using a I_2 -TBHP−DMSO system.

■ RESULTS AND DISCUSSION

The study began with the reaction of compound 1a with catalytic quantity of I_2 (0.05 equiv) and oxidant t-BuOOH

(TBHP, 2.0 equiv) in DMSO. While there was no reaction at room temperature (rt, Table 1, entry 1), the desired product 2a was obtained in 58% yield at 80 °C (entry 2). When the quantity of I_2 was increased to 0.1 equiv, the yield increased to 74% (entry 3). Interestingly, decreasing the quantity of TBHP to 1.0 equiv led to improved yield (86%, entry 4). Increasing or decreasing the temperature from 80 °C only led to a decrease in the yield (entries 5 and 6). In the absence of I_2 , no compound $2a$ was formed, which indicates that I_2 was crucial for the reaction (entry 7). Among the various iodine reagents

such as NIS, TBAI, KI, and PIDA used for the study (entries 8−11), I₂ furnished compound 2a in highest yield. Among various oxidants such as H_2O_2 , m-CPBA, and Oxone, the best yield was observed with TBHP (entries 4 and 12−14), and the absence of oxidant (entry 15) led to lower yield. DMSO was the most effective medium for this oxidative cyclization compared to DMF, toluene, and CH₃CN. As a result, I_2 (0.1) equiv) and TBHP (1.0 equiv) in DMSO at 80 °C (Table 1, entry 4) were found to be the optimum conditions.

With the optimal reaction conditions in hand, the substrate scope was explored. As shown in Scheme 2, compound 1d with primary amine afforded the isatin 2d in moderate yield (42%). Compounds 1a−c containing the N-benz[yl](#page-2-0) class of substituent gave better yield compared to the N-alkyl-substituted counter parts 1e and 1f. Substrate 1g with easily oxidizable N-allyl substituent gave isatin 2g in 76% yield.

Similarly, compound 1h with an N-phenyl substituent gave isatin 2h in 74% yield. Likewise, N-(2-bromoethyl)-substituted 2′-aminoacetophenone 1j formed isatin 2j easily. Contrary to the failure met with the CuI/bpy system,^{10e} compounds 1i, 1s, and 1t underwent facile domino cyclization under the present reaction conditions. While compound [1i](#page-6-0) with an N-ethyl acetate substituent gave isatin 2i in 68% yield, compounds 1s and 1t underwent N-deacetylation (31%) and N-debenzoylation (28%), respectively, to provide isatin 2d albeit in low yield. The presence of halogen, $4,6$ - $(\text{OMe})_2$, and $2,3,4$ - $(\text{OMe})_3$ substituents on the 2′-aminoacetophenone phenyl ring (1k− r) was well tolerated, and the corresponding products 2k−r were obtained in 74%−85% yield.

Next, we examined the feasibility of isatin formation from tertiary aniline 3a−d (Scheme 3). Surprisingly, tertiary aniline 3a underwent demethylation followed by oxidative amidation to provide isatin 2u in 76% yi[el](#page-2-0)d. Under identical conditions, substrates 3b−d were converted into corresponding isatins 2v, 2w, and 4d in good yield (69%−78%). This result and earlier results (Scheme 2, 1d, 1s, and 1t) shows that primary, secondary, tertiary aniline- and amido-substituted 2′-acetophenones can be con[ver](#page-2-0)ted into isatins by this oxidative amidation procedure.

The use of a stoichiometric amount of I_2 has a significant influence in the reaction. By varying the quantity of I_2 , it was found that with 1.5 equiv of I_2 and 1.0 equiv of TBHP in

Scheme 3. I₂-Catalyzed Amidation of Tertiary Anilines^{a,b}

DMSO compound 1a could be completely converted into iodoisatin 4a (Scheme 4). When 1.0 equiv of I_2 and 1.0 equiv of TBHP in DMSO was used, a mixture of iodinated isatin 4a and isatin 2a was obtained. Under the same reaction conditions, the 2′-aminoacetophenones 1b,c,e,u,x gave products 4b−f in good yield (70%−81%). Under identical conditions, the tertiary aniline 4a (Scheme 4) gave a 3:1 mixture of iodinated isatin 3d (40.5%) and isatin 2u (13.5%) after 16 h. This indicated that the oxidative amidation and iodination took place in one pot. To the best of our knowledge, this is the first example of the

Scheme 4. Synthesis of Substituted Iodoisatins Using a Stoichiometric Amount of $I_2^{a,b}$

synthesis of iodinated isatins, without a separate iodination step, via a domino process using molecular iodine as reagent as well as catalyst.

Next, the substrate scope was extended to benzyl alcohols (Scheme 5). On the basis of literature reports, we assumed that

Scheme 5. I₂-Catalyzed Amidation of Benzyl Alcohols^{a,b}

^aReaction conditions: **5** (1.0 mmol), IBX (1.0 mmol), I_2 (0.1 mmol), TBHP (1.0 equiv) in DMSO (2.0 mL) at 80 °C. ^bIsolated yield.

alcohol 5a in the presence of IBX could be easily oxidized to ketone,¹⁸ which in turn would undergo amidation reaction with I₂/TBHP/DMSO to afford the corresponding isatins in one pot. S[ec](#page-6-0)ondary alcohols 5a, 5n, 5u, and 5y underwent sequential oxidation followed by C−N bond formation to afford isatins 2a, 2n, 2u, and 2y, respectively, in high yield (70− 79%).

To understand the reaction mechanism, some additional experiments were carried out (Scheme 6). Low yield (15%) or traces of isatin 2a formation in the presence of aliphatic amine 6a or 6b (Scheme 6, eq 4) suggests N-I bond formation occurred by the more reactive alip[hat](#page-3-0)ic amine 6a or 6b, retarded Kornblum [o](#page-3-0)xidation, or N-I bond formation by compound 1a. Further, the formation of isatin 2d from amides 1s and 1t, through N-deacetylation and N-debenzoylation,

Scheme 6. Experiments To Study Mechanism

Scheme 7. Proposed Mechanism

respectively, supports the N-I bond formation (Scheme 2). Isatin 2u did not undergo iodination (Scheme 6, eq 5), which reveals that the aromatic ring iodination should take pl[ac](#page-2-0)e before the amidative ring closure.

On the basis of the above results, a plausible mechanism for the formation of isatin and iodoisatin is proposed (Scheme 7). The first step in isatin ring formation should be a facile Kornblum oxidation to form phenylglyoxal.¹⁹ I⁺ ions formed by the oxidation of I_2 in TBHP²⁰ may take part in iodination of amine as well as the aromatic ring and [ox](#page-6-0)idative amidation steps. Subsequent intramolec[ula](#page-6-0)r nucleophilic attack by the N-I bond to aldehyde is expected to lead to oxidative amidation. However, in case of primary, secondarym and tertiary anilines, it is difficult to rule out oxidative amidation taking place by intramolecular nucleophilic attack of an uniodinated amino group. The presence of DMSO helps regeneration of I_2 from HI. Secondary and tertiary anilines provide uniodinated isatins at lower concentration of I_2 (Scheme 2 and 3) and iodinated isatins at higher concentration of I_2 (Scheme 4), suggesting that Kornblum oxidation, N-iodination, an[d](#page-2-0) amid[o](#page-2-0) cyclization take place prior to aromatic iodination.

■ **CONCLUSION**

In conclusion, we have successfully developed a highly versatile, efficient, and metal-free synthesis of substituted isatins or iodoisatins, starting from $2'$ -NH₂, $2'$ -NH-alkyl, $2'$ -N,N-dialkyl, or 2′-NH-amidoacetophenones and 1-(2-aminophenyl)ethanols using I_2 -TBHP as a catalyst. By varying the concentration of I_2 , the reaction conditions can be fine-tuned to selective synthesis of isatin or iodoisatin. Overall, under the unimolecular approach, C−H, N−H, N−C bond cleavage as well as C−O, C−N, C−I bond formation was observed in one pot. A facile N-dealkylation and N-deacylation was observed for the first time in the presence of I_2 −TBHP. We have also demonstrated that secondary alcohols could be oxidized in situ to give isatins. The reaction condition is mild and has broad substrate scope. Thus, this method is expected to be the simplest method for the synthesis of isatin or iodoisatin and find wide utility in organic synthesis. Studies on further scope of this reaction are underway in our laboratory.

EXPERIMENTAL SECTION

General Information. All reagents were purchased commercially and used without further purification. ${}^{1}H$ NMR and ${}^{13}C$ NMR were recorded on a 400 MHz spectrometer. ¹H NMR (400 MHz) and ¹³C

The Journal of Organic Chemistry Article 30 and 200 an

NMR (100 MHz) spectra were recorded in CDCl₃ with tetramethylsilane as the internal standard. Multiplicities are reported using the following abbreviations: $s = singlet$, $d = doublet$, $t = triplet$, q $=$ quartet, $m =$ multiplet, $br =$ broad resonance. All the NMR spectra were acquired at ambient temperature. Thin-layer chromatography (TLC) was performed using silica gel 60 Å F254 precoated plates (0.25 mm thickness). Visualization was accomplished by irradiation with a UV lamp and staining with I_2 on silica gel. Elemental analysis was performed on a CHN analyzer.

General Method A: Typical Experimental Procedure for Synthesis of 1-(2-(Alkyl-/Arylamino)phenyl)ethanones. To a solution of 2′-aminoacetophenone (1.0 equiv) in DMF were added K_2CO_3 (1.5 equiv) and the corresponding halide (1.1 equiv) at ambient temperature and heated at 80 °C. Progress of the reaction was monitored by TLC. Upon completion of the reaction, it was allowed to cool to ambient temperature and diluted with ethyl acetate and water. The organic phase was separated, dried over $Na₂SO₄$, filtered, and concentrated. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate as eluent, and the corresponding products were obtained in 70−75% yield.

General Method B: Typical Experimental Procedure for Synthesis of 1-(2-(Dimethylamino)phenyl)ethanones. To a solution of 2′-aminoacetophenone (1.0 equiv) in DMF were added $K₂CO₃$ (2.5 equiv) and methyl iodide (3.0 equiv) at ambient temperature and the solution heated at 80 °C for 8−10 h. Progress of the reaction was monitored by TLC. Upon completion of the reaction, it was allowed to cool to ambient temperature and diluted with ethyl acetate and water. The organic phase was separated, dried over Na₂SO₄, filtered, and concentrated. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate as eluent, and the correcponding products were obtained in 78−82% yield.

General Method C: Typical Experimental Procedure for Synthesis of 1-(2-(Alkyl-/Benzylamino)phenyl)ethanol. To a solution of 2′-aminoacetophenone (1.0 equiv) in THF, sodium borohydride (1.5 equiv) was added at ambient temperature and stirred for 15 h. Upon completion of the reaction, it was diluted with ethyl acetate and water. The organic phase was separated, dried over $Na₂SO₄$, filtered, and concentrated. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate as eluent, and the correcponding products were obtained in 72−75% yield.

General Method D: Typical Experimental Procedure for I-Catalyzed Synthesis of N-Alkyl-/Arylisatin. To a solution of 1-(2- (alkyl-/arylamino)phenyl)ethanone (1, 1.0 equiv) in DMSO were added I_2 (0.1 equiv) and TBHP (1.0 equiv, 70% in H_2O) at ambient temperature and the mixture heated at 80 °C. Progress of the reaction was monitored by TLC. Upon completion of the reaction, the mixture was allowed to cool to ambient temperature and quenched with sodium thiosulfate water and ethyl acetate. The organic phase was separated, dried over Na_2SO_4 , filtered, and concentrated. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate as eluent.

General Method E: Typical Experimental Procedure for I_2 -Catalyzed Synthesis of 5-Iodo N-Alkyl-/Benzylisatin. To a solution of 1-(2-(alkyl-/benzylamino)phenyl)ethanone (1, 1.0 equiv) in DMSO were added I_2 (1.5 equiv) and TBHP (1.0 equiv, 70% in H_2O) at ambient temperature, and the mixture was heated at 80 °C. Progress of the reaction was monitored by TLC. Upon completion of the reaction, the mixture was allowed to cool to ambient temperature and quenched with sodium thiosulfate water and ethyl acetate. The organic phase was separated, dried over $Na₂SO₄$, filtered, and concentrated. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate as eluent.

General Method F: Typical Experimental Procedure for I₂-Catalyzed Synthesis of N-Methylisatin from Tertiary Amines. To a solution of 1-(2-(dimethylamino)phenyl)ethanone (4, 1.0 equiv) in DMSO were added I_2 (0.1 equiv) and TBHP (1.0 equiv, 70% in $H₂O$) at ambient temperature, and the mixture was heated at 80 °C. Progress of the reaction was monitored by TLC. Upon completion of the reaction, the mixturew was allowed to cool to ambient temperature and quenched with sodium thiosulfate water and ethyl acetate. The

organic phase was separated, dried over $Na₂SO₄$, filtered, and concentrated. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate as eluent.

General Method G: Typical Experimental Procedure for I2- Catalyzed Synthesis of ^N-Alkyl-/Benzylisatin from Secondary Alcohols. To a solution of 1-(2-(alkyl-/benzylamino)phenyl)ethanol $(5, 1.0$ equiv) in DMSO were added IBX $(1.0$ equiv), I_2 $(0.1$ equiv), and TBHP (1.0 equiv, 70% in H_2O) at ambient temperature, and the mixture was heated at 80 °C. Progress of the reaction was monitored by TLC. Upon completion of the reaction, the mixture was allowed to cool to ambient temperature and quenched with sodium thiosulfate water and ethyl acetate. The organic phase was separated, dried over Na2SO4, filtered, and concentrated. The crude product was purified by silica gel column chromatography using hexane/ethyl acetate as eluent.

The spectral data of the compound 2h were in agreement with the values reported in the literature.^{10e}

Ethyl 2-(2,3-Dioxoindolin-1-yl)acetate (2i). The reaction was carried out according to general [me](#page-6-0)thod D. Red solid: yield 68% (71.6 mg); mp 127−129 °C; ¹H NMR (400 MHz, CDCl₃) δ 7.65−7.57 (m, 2H), 7.16 (t, $m = 7.6$ Hz, 1H), 6.79 (d, $J = 8.0$ Hz, 1H), 4.49 (s, 2H), 4.25 (q, $J = 7.2$ Hz, 2H), 1.28 (t, $J = 7.0$ Hz, 3H); ¹³C NMR (100) MHz, CDCl₃) δ 182.5, 166.8, 158.1, 150.3, 138.41, 125.6, 124.2, 117.7, 110.1, 62.2, 41.3, 14.1. The spectral data of the compound 2i were in agreement with the values reported in the literature. 21

1-(2-Bromoethyl)indoline-2,3-dione (2j). The reaction was carried out according to general method D. Red [so](#page-6-0)lid: yield 71% (74.5 mg); mp 131–133 °C; ¹H NMR (400 MHz, CDCl₃) δ 7.65– 7.59 (m, 2H), 7.15 (t, J = 7.6 Hz, 1H), 7.0 (d, J = 7.6 Hz, 1H), 4.15 (t, $J = 6.8$ Hz, 2H), 3.61 (t, $J = 6.8$ Hz, 2H); ¹³C NMR (100 MHz, CDCl3) δ 182.7, 158.2, 150.5, 138.4, 125.8, 124.1, 117.7, 110.2, 42.0, 27.1. The spectral data of the compound 2j were in agreement with the values reported in the literature. 21

5-Chloro-1-methyl-1H-indole-2,3-dione (2k). The reaction was carried out according to general met[ho](#page-6-0)d D. Red solid: yield 74% (78.8 mg); mp 157–159 °C; ¹H NMR (400 MHz, CDCl₃) δ 7.59–7.57 (m, 2H), 6.87–6.85 (m, 1H), 3.26 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 182.3, 157.7, 149.7, 137.7, 129.7, 125.3, 118.3, 111.2, 26.4. The spectral data of the compound 2k were in agreement with the values reported in the literature. ²⁶

5-Bromo-1-benzyl-1H-indole-2,3-dione (2l). The reaction was carried out according to g[ene](#page-7-0)ral method D. Red solid: yield 79% (82.6 mg); mp 135−137 °C; ¹H NMR (400 MHz, CDCl₃) δ 7.51 (d, J = 2.0 Hz, 1H), 7.37−7.35 (dd, J = 8.4, 2.0 Hz, 1H), 7.30−7.23 (m, 5H), 6.65 (d, J = 8.4 Hz, 1H), 4.86 (s, 2H); ¹³C NMR (100 MHz, CDCl₃) δ 182.3, 157.8, 149.0, 137.7, 134.0, 129.8, 129.2, 128.4, 127.4, 125.4, 118.5, 112.3, 44.2. The spectral data of the compound 2l were in agreement with the values reported in the literature.²

5-Bromo-1-ethyl-1H-indole-2,3-dione (2m). The reaction was carried out according to general method D. Red soli[d: y](#page-7-0)ield 76% (79.7 mg); mp 147–149 °C; ¹H NMR (400 MHz, CDCl₃) δ 7.71 (d, J = 2 Hz, 2H), 7.70 (s, 1H), 6.83 (d, $J = 8.8$ Hz, 1H), 3.78 (q, $J = 7.2$ Hz, 2H), 1.31 (t, J = 7.2 Hz, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 182.5, 157.2, 149.4, 140.5, 128.3, 118.8, 116.4, 111.7, 35.1, 12.4. The spectral data of the compound 2m were in agreement with the values reported in the literature.

5-Bromo-1-benzyl-1H-indole-2,3-dione (2n). The reaction was carried out acco[rdi](#page-7-0)ng to general method D. Red solid: yield 80% (83.1 mg).

The reaction was also carried out according to general method G: yield 72% (74.3 mg); mp 149−150 °C; ¹H NMR (400 MHz, CDCl₃) δ 7.71 (d, J = 2.0 Hz, 1H), 7.58 (dd, J = 8.4, 2.0 Hz, 1H), 7.37–7.29 $(m, 5H)$, 6.67 (d, J = 8.4 Hz, 1H), 4.92 (s, 2H); ¹³C NMR (100 MHz, CDCl₃) δ 182.1, 157.5, 149.4, 140.5, 134.0, 129.2, 128.4, 128.2, 127.4, 118.9, 116.8, 112.7, 44.2. The spectral data of the compound 2n was in agreement with the values reported in the literature.²

1-Ethyl-4,6-dimethoxy-1H-indole-2,3-dione (2o). The reaction was carried out according to general method D. Y[ell](#page-7-0)ow solid: yield 82% (86.3 mg); mp143–145 °C; ¹H NMR (400 MHz, CDCl₃) δ 6.01 $(s, 2H)$, 3.95 $(s, 3H)$, 3.93 $(s, 3H)$, 3.71 $(q, J = 7.2 \text{ Hz}, 2H)$, 1.27 (t, J) $= 7.2$ Hz, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 177.6, 170.1, 161.3, 159.8, 153.3, 100.7, 91.6, 90.5, 56.3, 56.2, 35.0, 13.0. The spectral data of the compound 2o were in agreement with the values reported in the literature.^{10f}

1-Benzyl-4,6-dimethoxy-1H-indole-2,3-dione (2p). The reaction was [ca](#page-6-0)rried out according to general method D. Yellow solid;

yield 84% (87.5 mg); mp181−183 °C; ¹H NMR (400 MHz, CDCl₃) δ 7.36−7.27 (m, 5H), 5.98 (d, J = 2.0 Hz, 1H), 5.89 (d, J = 2.0 Hz, 1H), 4.86 (s, 2H), 3.94 (s, 3H), 3.81 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 177.1, 170.0, 161.2, 160.2, 153.3, 135.1, 129.0, 128.0, 127.3, 100.9, 91.9, 91.5, 56.3, 56.1, 44.0. The spectral data of the compound 2p was in agreement with the values reported in the literature.

1-Ethyl-4,5,6-trimethoxy-1H-indole-2,3-dione (2q). The reaction was carried out according to general method D. R[ed](#page-6-0) solid: yield 84% (87.9 mg); mp 115−117 °C; ¹H NMR (400 MHz, CDCl₃) δ 6.11 $(s, 1H)$, 4.21 $(s, 3H)$, 4.00 $(s, 3H)$, 3.77 $(s, 3H)$, 3.74 $(q, J = 7.2 \text{ Hz}$, 2H), 1.29 (t, J = 7.2 Hz, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 178.0, 162.4, 159.0, 154.3, 148.7, 136.3, 102.5, 89.4, 62.2, 61.5, 56.9, 34.8, 13.0. The spectral data of the compound 2q was in agreement with the values reported in the literature.¹⁰

1-Benzyl-4,5,6-trimethoxy-1H-indole-2,3-dione (2r). The reaction was carried out according [to](#page-6-0) general method D. Red solid: yield 85% (88.2 mg); mp 151–152 $^{\circ}$ C; ¹H NMR (400 MHz, CDCl₃) δ 7.38−7.27 (m, 5H), 5.99 (s, 1H), 4.89 (s, 2H), 4.20 (s, 3H), 3.81 (s, 3H), 3.73 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 177.6, 162.2, 159.4, 154.2, 148.7, 136.4, 135.0, 129.1, 128.2, 127.3, 102.6, 90.5, 62.3, 61.5, 56.6, 44.0. The spectral data of the compound 2r were in agreement with the values reported in the literature. 10f

1-Methyl-1H-indole-2,3-dione (2u). The reaction was carried out according to general method F. Red solid: yield [76%](#page-6-0) (75.0 mg).

The reaction was carried out according to general method G: yield 75% (79.9 mg); mp 121−122 °C; ¹ H NMR (400 MHz, CDCl3) δ 7.63−7.59 (m, 2H), 7.13 (t, J = 7.4 Hz, 1H), 6.90 (d, J = 8.4 Hz, 1H), 3.25 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 183.3, 158.3, 151.5, 138.4, 125.3, 123.9, 117.5, 109.9, 26.2. The spectral data of the compound 2u were in agreement with the values reported in the literature. $^{\rm 21}$

5-Bromo-1-methyl-1H-indole-2,3-dione (2v). The reaction was carried o[ut](#page-6-0) according to general method F. Red solid: yield 70% (69.4 mg); mp 173−175 °C; ¹H NMR (400 MHz, CDCl₃) δ 7.73 (d, J = 1.6 Hz, 2H), 7.71 (s, 1H), 6.80 (d, J = 8.4 Hz, 1H), 3.25 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 182.1, 157.5, 150.2, 140.6, 128.1, 118.6, 116.7, 111.6, 26.4. The spectral data of the compound 2v was in agreement with the values reported in the literature.²⁶

1-Methyl-4,5,6-trimethoxy-1H-indole-2,3-dione (2w). The reaction was carried out according to general met[hod](#page-7-0) F. Red solid: yield 78% (77.3 mg); mp 110−112 °C; ¹H NMR (400 MHz, CDCl₃) $δ$ 6.11 (s, 1H), 4.21 (s, 3H), 4.00 (s, 3H), 3.77 (s, 3H), 3.20 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) $δ$ 176.7, 161.3, 158.3, 153.3, 148.5, 135.5, 101.3, 88.3, 61.3, 60.5, 55.8, 28.7, 25.2. The spectral data of the compound 2w were in agreement with the values reported in the literature.^{10f}

1-Butyl-1H-indole-2,3-dione (2x). The reaction was carried out accordin[g to](#page-6-0) general method G. Semisolid: yield 70% (74.3 mg); ¹H NMR (400 MHz, CDCl₃) δ 7.61–7.56 (m, 2H), 7.13–7.09 (m, 1H), 6.90 (d, J = 7.6 Hz, 1H), 3.72 (t, J = 7.2 Hz, 2H), 1.72–1.62 (m, 2H), 1.46−1.37 (m, 2H), 0.97 (t, J = 7.4 Hz, 3H); ¹³C NMR (100 MHz, CDCl3) δ 183.7, 158.2, 151.1, 138.3, 125.5, 123.6, 117.6, 110.2, 40.0, 29.30, 20.2, 13.7. The spectral data of the compound 2x were in agreement with the values reported in the literature. 21

5-Iodo-1-benzyl-1H-indole-2,3-dione (4a). The reaction was carried out according to general method E. Red [so](#page-6-0)lid: yield 79% (127.3 mg); mp 151–153 °C; ¹H NMR (400 MHz, CDCl₃) δ 7.89 (s, 1H), 7.76 (dd, J = 8.4, 1.6 Hz, 1H), 7.37−7.29 (m, 5H), 6.57 (d, J = 8.0 Hz, 1H), 4.91 (s, 2H); ¹³C NMR (100 MHz, CDCl₃) δ 181.9, 157.3, 150.0, 146.3, 134.0, 133.9, 129.2, 128.4, 127.4, 119.2, 113.1, 86.2, 44.2. The spectral data of the compound 4a were in agreement with the values reported in the literature.²

5-Iodo-1(4-methoxybenzyl)-1H-indole-2,3-dione (4b). The reaction was carried out according to g[ene](#page-7-0)ral method E. Red solid: yield 81% (124.7 mg); mp 145−147 °C; ¹H NMR (400 MHz, CDCl₃) δ 7.87 (s, 1H), 7.76 (dd, J = 8.4, 1.6 Hz, 1H), 7.26–7.22 (m, 2H), 6.86 $(dd, J = 6.8, 2.0 Hz, 2H), 6.59 (d, J = 8.4 Hz, 1H), 4.84 (s, 2H), 3.78$ (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 182.0, 159.6, 157.2, 150.1, 146.3, 133.8, 128.9, 126.0, 119.3, 114.5, 113.2, 86.1, 55.3, 43.7. The

spectral data of the compound 4b were in agreement with the values reported in the literature.³⁰

1-(4-Chlorobenzyl)-5-iodo-1H-indole-2,3-dione (4c). The reaction was carried out ac[cor](#page-7-0)ding to general method E. Red solid: yield 72% (110.2 mg); mp 206−208 °C; ¹ H NMR (400 MHz, CDCl3) δ 7.90 (s, 1H), 7.79 (dd, J = 8.2, 1.8 Hz, 1H), 7.34−7.31 (m, 2H), 7.26 $(d, J = 2.0$ Hz, 1H), 7.23 (s, 1H), 6.54 (d, $J = 8.4$ Hz, 1H), 4.88 (s, 2H); 13C NMR (100 MHz, CDCl3) δ 181.6, 157.2, 149.7, 146.4, 134.4, 134.0, 132.6, 129.4, 128.8, 119.3, 112.9, 86.4, 43.5; MS (ESI): 397.11 (M + 1) for $C_{15}H_9CIINO_2$. Anal. Calcd for $C_{15}H_9CINO_2$: C, 45.31; H, 2.28. Found: C, 45.28; H, 2.31.

5-Iodo-1-methyl-1H-indole-2,3-dione (4d). The reaction was carried out according to general method E. Red solid: yield 75% (144.3 mg) .

The reaction was also carried out according to general method E: yield 54% (94.9 mg).

The reaction was also carried out according to general method F: yield 69% (68.5 mg); mp 161−163 °C; ¹H NMR (400 MHz, CDCl₃) δ 7.92−7.87 (m, 2H), 6.71 (d, J = 8.4 Hz, 1H), 3.24 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 182.0, 157.2, 150.8, 146.4, 133.8, 119.0, 112.1, 86.0, 26.3. The spectral data of the compound 4d was in agreement with the values reported in the literature.²⁹

5-Iodo-1-ethyl-1H-indole-2,3-dione (4e). The reaction was carried out according to general method E. Red [sol](#page-7-0)id: yield 71% (130.9 mg); mp 141−143 ⁵C; ¹H NMR (400 MHz, CDCl₃) δ 7.90− 7.87 (m, 2H), 6.72 (d, $J = 8.8$ Hz, 1H), 3.77 (q, $J = 7.2$ Hz, 2H), 1.30 (t, J = 7.2 Hz, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 182.3, 156.9, 150.0, 146.3, 134.0, 119.2, 112.1, 85.8, 35.1, 12.4. The spectral data of the compound 4e was in agreement with the values reported in the literature.²⁹

5-Iodo-1-octyl-1H-indole-2,3-dione (4f). The reaction was carried o[ut](#page-7-0) according to general method E. Red solid: yield 70% (109 mg); mp 82−84 °C; ¹ H NMR (400 MHz, CDCl3) δ 7.81−7.79 $(m, 2H)$, 6.64 (d, J = 8.8 Hz, 1H), 3.62 (t, J = 7.4 Hz, 2H), 1.63–1.56 (m, 2H), 1.27−1.18 (m, 11H), 0.80 (t, J = 6.8 Hz, 3H); ¹³C NMR $(100 \text{ MHz}, \text{CDCl}_3)$ δ 181.3, 156.1, 149.4, 145.3, 132.9, 118.1, 111.3, 84.8, 39.4, 30.7, 28.1, 28.1, 26.2, 25.9, 21.6, 13.0; MS (ESI) 386.31 (M + 1) for $C_{16}H_{20}INO_2$. Anal. Calcd for $C_{16}H_{20}INO_2$: C, 49.88; H, 5.23. Found: C, 49.67; H, 5.28.
