ABSTRACT: The heterocycle-containing diarylmethane synthesis from chloromethyl(hetero)arenes with (hetero)arylboronic reagents was attained using the palladium/ether-imidazolium chloride system. This coupling process tolerated a diverse range of heteroaromatic moieties with sufficient catalytic activity to achieve the efficient synthesis of various diheteroarylmethanes in good to excellent yields.

Diheteroarylmethanes are known as ubiquitous and important structures in naturally occurring and biologically active compounds.¹ Although transition metal-catalyzed C–C bond formation is one of the most powerful synthetic methods,^{2,3} diheteroarylmethane synthesis through cross-coupling reactions with chloromethylheteroarenes has been limited to only two reports,⁴ which are preferable to other halomethylheteroarenes in the light of cost, diversity, and stability.⁵ In these methods, only a very few kinds of specific chloromethylheteroarenes and heteroarylboronic acids were applied to the preparation of diheteroarylmethanes. Therefore, the development of effective coupling reactions for diheteroarylmethane synthesis with broad scope of substrates is still desired, in which Suzuki–Miyaura reaction is highly suitable due to the superior features of organoboronic acids and their derivatives, such as low toxicity, easy manipulation, and ready availability.^{6,7} However, the catalytic cross-coupling for heteroaryl derivative synthesis remains a challenging task on the grounds of detrimental influences of heterocyclic motifs on catalytic activity,⁸ and substantial efforts have been made to find effective ligands for Suzuki–Miyaura reaction with heteroaryl substrates.^{9,10} Recently, we developed the ether-imidazolium chlorides (Figure 1) as *N*-heterocyclic carbene precursors,^{11–13} and found that the palladium/ether-imidazolium chloride system achieved high catalytic performance and broad substrate tolerance for heteroaryl moieties.¹⁴

Herein, we describe the palladium-catalyzed synthesis of heterocycle-containing diarylmethanes from chloromethyl(hetero)arenes through the Suzuki–Miyaura reaction with the ether-imidazolium chlorides.

First of all, optimization of reaction conditions was conducted using 2-chloro-5-(chloromethyl)pyridine (**1a**) and 3-thiopheneboronic acid (**2a**) as model substrates (Table 1). The cross-coupling with 1.0 mol % of catalysts (Pd/L = 1/2) formed in situ from carbene ligand precursors **L1–3** and allylpalladium(II) chloride dimer was carried out at 90 °C, and ether-imidazolium chloride **L2** proved to be a superior ligand precursor (entries 2–4), while the control experiment using no imidazolium chloride afforded no conversion (entry 1). A series of palladium sources were examined, and tris(dibenzylideneacetone)dipalladium(0) led to the highest catalytic activity to give 2-chloro-5-(thiophen-3-ylmethyl)pyridine (**3aa**) in 86% yield (entries 3 and 5–8).¹⁵ The screening of bases revealed that cesium carbonate was the reagent of choice (entries 8–12). The influence of solvents was investigated, and dioxane was found to be the most suitable (entries 8 and 13–16).

Investigation of heterocycle-containing diarylmethane synthesis was conducted with chloromethylheteroarenes and arylboronic acids (Scheme 1). In the cross-coupling using 2-chloro-5-(chloromethyl)pyridine (**1a**), a series of arylboronic acids was examined. The sterically hindered 2-methylphenylboronic acid (**2d**) as well as 3- and 4-methylphenylboronic acid (**2c** and **2b**) reacted smoothly to give desired products **3ab–ad** in high yields. The electron-rich arylboronic acids with a methoxy or methylsulfanyl group were also proved to be good reaction partners (**3ae–af**), while the electron-withdrawing substituents on aromatic rings led to slight

were carried out. In addition to indole-containing substrate **1b**, 2- and 3-(chloromethyl)thiophene (**1c–d**) afforded excellent yields (**3bi–di**). The cross-coupling using furan-type substrates **1e–f** proceeded with high efficiency (**3ei–fi**).

Influence of heteroarylboron reagents was investigated in heterocycle-containing diarylmethane synthesis with chloromethylarenes (Scheme 2). A series of chloromethylarenes was tested using 3-thiopheneboronic acid (**2a**) as a coupling partner. The benzyl chlorides bearing a methyl group at the 4- or 3-position were easily converted to give desired products **3ga–ha** with high yields. No significant decrease in yield was observed in the coupling reactions with sterically hindered chloromethylarenes (**3ia–ja**). Both the electron-rich and -poor benzyl chloride derivatives **1k–m** led to excellent yields of coupling products (**3ka–ma**). Subsequently, a set of heteroarylboron reagents were examined in the cross-coupling using benzyl chloride (**1n**) or 2-methylbenzyl chloride (**1i**). 4-Dibenzothienylboronic acid (**2j**) was also a good coupling partner to afford an excellent yield (**3nj**). The coupling reactions with heteroarylboronic acids bearing pyridine, quinoline, and indole moieties proceeded with sufficient efficiency (**3ik** and **3nl–nm**). In addition, furan derivative-containing organoboron reagents showed good reactivity (**3nn** and **3io**).

The catalytic synthesis of diheteroarylmethanes was examined with 1.0–3.0 mol % catalyst loading (Scheme 3). Sufficient catalytic activity for the cross-coupling with 2-chloro-5-(chloromethyl)pyridine (**1a**) was observed even in the use of organoboron reagents bearing an unprotected

indole (**3am**) in addition to thiophene, pyridine, and furan moieties (**3aa**, **3aj–ak**, and **3an**). *N*-Protected 5-(chloromethyl)-1*H*-indole (**1b**) was also applicable to the catalytic preparation of various diheteroarylmethanes, leading to high yields (**3ba**, **3bk**, and **3bm–bn**). In the coupling reactions with 2- and 3-(chloromethyl)thiophene (**1c–d**), broad substrate tolerance was achieved for sulfur-, nitrogen-, oxygen-containing heteroaromatic rings (**3ca**, **3ck**, **3co**, **3da**, and **3dk–dn**). Ethyl 5-(chloromethyl)furan-2-carboxylate (**1e**) as well as 4-(chloromethyl)dibenzofuran (**1f**) reacted with good to excellent efficiency in the presence of heteroaryl coupling partners (**3ej**, **3fa**, **3fi**, and **3fn**).

In summary, the catalytic synthesis of heterocycle-containing diarylmethanes through Suzuki–Miyaura cross-coupling was achieved with 1.0–3.0 mol % of the palladium/ether-imidazolium chloride system. This coupling process proceeded with sufficient catalytic activity and high substrate tolerance. The substrate combination of chloromethylarenes and heteroarylboron reagents as well as chloromethylheteroarenes and arylboronic acids gave desired coupling products with high efficiency. In addition, a variety of diheteroarylmethanes were successfully prepared from chloromethylheteroarenes and heteroarylboron reagents to afford good to excellent yields.

EXPERIMENTAL SECTION

General. All melting points are not corrected. IR spectra were expressed in cm⁻¹. ¹H and ¹³C NMR spectra were taken at 400 and 100 MHz, respectively. Chemical shift values are expressed in ppm relative to internal or external TMS. Abbreviations are as follows: s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; br, broad. A double-focusing magnetic sector mass spectrometer was used for low- and high-resolution EIMS. The products were isolated by silica gel column chromatography. All reagents were used as received. Dioxane was distilled from sodium benzophenone ketyl under argon. The preparations of 2-(chloromethyl)thiophene (**1c**)¹⁶ and 3-(chloromethyl)thiophene (**1d**)¹⁷ were conducted as reported before.

Benzyl 5-(Chloromethyl)-1*H*-indole-1-carboxylate (1b**).** This substrate was prepared using a reported method.¹⁸ A stock solution (1.5 M) was prepared by mixing up SOCl₂ (1.43 g, 12 mmol) and 1*H*-benzotriazole (1.43 g, 12 mmol) in CH₂Cl₂ (8.0 mL). To the solution of benzyl 5-(hydroxymethyl)-1*H*-indole-1-carboxylate (1.46 g, 5.2 mmol) in CH₂Cl₂ (52 mL), was added the stock solution (1.5 equiv) intermittently. The reaction mixture was stirred for 10 min at room temperature. The solid was filtered off and washed with CH₂Cl₂. The filtrate was washed with 10% HCl and H₂O followed by 2% NaOH solution. The organic layer was separated and dried over MgSO₄. Concentration and purification through silica gel column chromatography (hexane/AcOEt = 10/1) gave 1.26 g of **1b** (4.20 mmol, 81%) as white solids of mp 107–108 °C. ¹H NMR (400 MHz, CDCl₃): δ 4.70 (s, 2H), 5.46 (s, 2H), 6.58 (d, *J* = 3.6 Hz, 1H), 7.35 (d, *J* = 8.8 Hz, 1H), 7.38–7.44 (m, 3H), 7.48 (d, *J* = 6.8 Hz, 2H), 7.59 (s, 1H), 7.65 (d, *J* = 3.6 Hz, 1H), 8.16 (d, *J* = 6.8 Hz, 1H). ¹³C NMR (100 MHz, CDCl₃): δ 46.8 (CH₂), 68.8 (CH₂), 108.1 (CH), 115.5 (CH), 121.2 (CH), 125.3 (CH), 126.4 (CH), 128.5 (CH), 128.8 (CH), 130.7 (C), 132.3 (C), 134.9 (C), 135.1 (C), 150.7 (C). 4-(Chloromethyl)dibenzofuran (1f**).** This substrate was prepared using a reported method.¹⁹ To the solution of 4-(hydroxymethyl)dibenzofuran (1.98 g, 10 mmol) in CH₂Cl₂ (15 mL), was added SOCl₂ (21.4 g, 180 mmol) slowly at room temperature. The reaction mixture was refluxed for 1 h. Then, concentration and purification through silica gel column chromatography (hexane/AcOEt = 100/1) gave 1.63 g of **1f** (7.52 mmol, 75%) as white solids of mp 74–75 °C. ¹H NMR (400 MHz, CDCl₃): δ 4.99 (s, 2H), 7.34 (t, *J* = 7.4 Hz, 1H), 7.36 (t, *J* = 7.4 Hz, 1H), 7.46–7.51 (m, 2H), 7.62 (d, *J* = 8.4 Hz, 1H), 7.92 (d, *J* = 8.0 Hz, 1H), 7.95 (d, *J* = 8.0 Hz, 1H). ¹³C NMR (100 MHz, CDCl₃): δ 40.3 (CH₂), 111.9 (CH), 120.8 (CH), 121.1 (CH), 121.5 (C), 123.0 (CH), 124.0 (C), 124.6 (C), 127.4 (CH), 127.6 (CH), 153.9 (C), 156.1 (C). Typical Procedure for Catalytic Synthesis of Heterocycle-Containing Diarylmethanes through Suzuki–Miyaura Cross-Coupling. Under argon atmosphere, a reaction tube was charged with **L2** (8.66 mg, 0.02 mmol), Pd₂(dba)₃ (4.58 mg, 0.005 mmol), and Cs₂CO₃ (652 mg, 2.0 mmol). Then, dioxane (2.0 mL) was added. The mixture was stirred for 15 min at 80 °C. Then, 2-chloro-5-(chloromethyl)pyridine (**1a**) (162 mg, 1.0 mmol) and 3-

thiopheneboronic acid (**2a**) (192 mg, 1.5 mmol) were added at room temperature. The reaction mixture was stirred at 90 °C for 6 h. Water and saturated Na₂CO₃ were added, and then the resulting mixture was extracted with CH₂Cl₂. The combined organic layers were dried over Na₂SO₄. Concentration and purification through silica gel column chromatography gave desired product **3aa**.

2-Chloro-5-(4-methylbenzyl)pyridine (3ab). 4-(2-Methylfuran-5-ylmethyl)dibenzofuran (3fn). After the reaction mixture was stirred for 15 h at 90 °C and cooled to room temperature, CH₂Cl₂ and 1 M NaOH were added. The resulting mixture was stirred for 1 h at room temperature and extracted with CH₂Cl₂. The combined organic layers were dried over Na₂SO₄. Concentration and purification through column chromatography (hexane/Et₂O = 200/1) gave 223 mg of the product (0.85 mmol, 85%) as colorless oil. ¹H NMR (400 MHz, CDCl₃): δ 2.26 (s, 3H), 4.30 (s, 2H), 5.87–5.88 (m, 1H), 5.94 (d, *J* = 2.8 Hz, 1H), 7.28–7.31 (m, 2H), 7.32–7.36 (m, 1H), 7.46 (dt, *J* = 1.2, 8.3 Hz, 1H), 7.58 (d, *J* = 8.3 Hz, 1H), 7.81–7.86 (m, 1H), 7.95 (dd, *J* = 0.5, 8.3 Hz, 1H). ¹³C NMR (100 MHz, CDCl₃): δ 13.6 (CH₃), 28.2 (CH₂), 106.1 (CH), 107.2 (CH), 111.7 (CH), 118.8 (CH), 120.6 (CH), 122.5 (C), 122.6 (CH), 122.8 (CH), 124.0 (C), 124.5 (C), 127.0 (CH), 127.5 (CH), 151.1 (C), 151.3 (C), 154.4 (C), 156.1 (C).
