Supporting Information

ABSTRACT: A direct metal-free α -hydroxylation of α unsubstituted β -oxoesters and β -oxoamides was developed using m-chloroperbenzoic acid as the oxidant. This transformation enabled straightforward metal-free access to important α -hydroxy- β -dicarbonyl moieties under mild reaction conditions. Furthermore, the hydroxylated products were readily converted into vicinal tricarbonyl compounds, which are useful synthetic precursors of numerous biological targets.

The α -oxidation of β -dicarbonyl compounds, leading to lacksquare both lpha-hydroxy and lpha-oxo derivatives, is an important chemical transformation in synthetic chemistry and pharmaceutical science. α -Hydroxy- β -dicarbonyl moieties are often found in antibiotics such as Kjellmanianone² and Hamigeran A,3 as well as in key intermediates such as those for the synthesis of olmesartan,4 dihydroimidazoquinoline, a known thrombin-activatable fibrinolysis inhibitor (TAFIa),5 and vitamin B6.6 Recent oxidative synthetic efforts have employed hydroperoxides, dimethyldioxirane, molecular oxygen, and oxaziridines10 as oxidants. However, there is no report for the direct α -hydroxylation of α -unsubstituted β -dicarbonyl compounds 1 except for only a few examples using limited substrates and metal salts as oxidant. This is probably because the enolizable α -hydroxy- β -dicarbonyl compounds 2 cause further oxidation under such conditions. It appears that an additional α -substituent is required to avoid undesirable side reactions such as Baeyer-Villiger-type oxidation and C-C bond cleavage. 12 Indirect methods to generate enolizable α hydroxy- β -dicarbonyl compounds 2 require modifications of the α -carbon, such as halogenation, ¹³ acetylation, ¹⁴ and diazotization^{5,15} or conversion to silyl enol ethers ¹⁶ before the α -hydroxylation step (Scheme 1(a)). These two-step methods suffer from drawbacks such as somewhat complicated experimental manipulations and low efficiency. α -Hydroxylated β -dicarbonyl compounds are unstable under oxidative reaction conditions and hence decompose or undergo further oxidation to give α,β -dioxocarbonyl compounds, the so-called vicinal tricarbonyls 3 (VTCs).¹⁷ Although the direct synthesis of VTCs from 1 has been recently reported, ^{18,19} the VTCs were obtained via a single-electron transfer process, which does not involve the formation of 2 as an intermediate. These circumstances prompted us to study the direct metal-free hydroxylation of 1.

Taking into account the instability of α -hydroxy- β -dicarbonyl compounds, we employed ethyl benzoylacetate (1a) as the substrate for easy handling of the product (Table 1). We also employed electrophilic m-chloroperbenzoic acid (mCPBA) as

the oxidant. When the reactions were conducted in alcohols at ambient temperature, complicated reaction mixtures were obtained and the desired α -hydroxylated product 2a was formed in very low yields (Table 1, entries 1 and 2). Aprotic solvents were found to be more effective, and 2a was obtained in moderate yields (entries 3–5). Among the examined aprotic solvents, toluene was chosen to further optimize the reaction conditions because of its low price and low toxicity. Raising the

"Reaction conditions: 1a (0.2 mmol), mCPBA (65 wt %, 0.24 mmol), solvent (2 mL). ^bDetermined by ¹H NMR analysis using 1,1,2,2-tetrachloroethane as an internal standard; the value in parentheses is the isolated yield. ^cEach reaction was performed at least three times, and data presented are of one representative experiment (the range of yields are 53–47% in CHCl₃, 50–39% in MeCN, and 53–51% in PhMe). ^dThe reaction was conducted using 1.0 g (5.0 mmol) of 1a.

reaction temperature to 60 °C led to almost quantitative conversion (entry 6), whereas no reaction occurred under the same reaction conditions using other oxidants, such as t-BuOOH, Na₂BO₃·4H₂O, H₂O₂, and H₂O₂ in AcOH. The oxidation of 1a by mCPBA could be used in large-scale reaction to afford 2a in a similar yield (entry 7).

Despite the presence of the benzoyl group, the α -hydroxylated product 2a was found to be unstable toward air oxidation, and small amounts of 3a were detected after purification by silica gel column chromatography that had run over several hours. Hence, we concluded that the purification of 2a should be completed within 1 h (Scheme 2).

With the optimized reaction conditions, the substrate scope was then investigated (Table 2). The electronic nature of the substituents on the phenyl ring did not reveal significant influence on the reactivity, and benzoylacetates 1b and 1c were efficiently α -hydroxylated (entries 1 and 2). On the other hand, the substituent obviously had an influence on the stability of the hydroxylated product and isolated yields somewhat varied. α-Hydroxylated p-nitrobenzoylacetate 2b was found to be less stable than 2a, and 15% of 3b was obtained despite rapid purification by silica gel column chromatography. Furthermore, α -hydroxylated aliphatic β -oxoester **2d** revealed lower stability than 2a-c and easily decomposed to a volatile and hardly isolable compound. The introduction of a longer alkyl chain or a bulkier group on the substrate led to less volatile compounds, and hydroxylated products 2e and 2f were isolated in 67% and 78% yields, respectively (entries 4 and 5). As anticipated, the sterically restricted cyclic β -oxoester 1g, α -substituted oxoester, was efficiently transformed to 2g, which is rather stable because it does not form the enol form, and the isolation proceeded

smoothly (entry 6). However, hydroxylated products were not obtained in the case of 2,4-pentanedione, 1,3-diphenyl-1,3-propanedione, and diethyl malonate.²⁰

Notably, oxidation of β -oxoamides 1h-j afforded the corresponding α -hydroxylated products 2h-j in only moderate yields (entries 7 and 8). Lowering the reaction temperature (0 °C) was found to slightly increase the yield of the products. In the case of benzoyl acetamide 1j, the α -hydroxylated product 2j was isolated in 64% yield without significant loss (entry 9).

Next, we investigated the oxidation of α -hydroxy- β dicarbonyl compounds 2 to yield VTCs 3, which are widely used for syntheses of polyfunctionalized compounds¹⁷ (Table 3). As shown in Scheme 2, silica gel aided the air oxidation to afford a mixture of VTC 3a and its hydrate form 3a', though in only moderate yield (entry 1). Hence, acceleration by several metal salts was evaluated (entries 2-6), and Cu(OAc)₂ was identified as the most effective oxidant, to afford 3a in 92% yield (entry 6). While the oxidation similarly proceeded with 50 and 20 mol % of Cu(OAc)2 under air (entries 7 and 8), the efficiency of the reaction considerably decreased under argon (entry 9), which indicated that the O2 is a relevant oxidant in this oxidation reaction.²¹ To examine the reaction scope, compounds 2 were submitted to the latter oxidation conditions (Table 4). This method was applicable not only to hydroxylated-aromatic oxoesters 2b and 2c but also to aliphatic ones 2e and 2f, and the corresponding VTCs were furnished in high yields. α -Hydroxy- β -oxoamide 2j was also oxidized, though the yield of 3j was only moderate.

The direct metal-free α -oxidation of α -unsubstituted β -dicarbonyl compounds 1 was successfully achieved under mild conditions using mCPBA as the oxidant. This protocol constitutes a new and straightforward route to α -hydroxylated β -oxoesters and β -oxoamides. Further advantages of this method include ready availability of the substrates and high atom economy. Moreover, since the α -hydroxy- β -dicarbonyl products 2 can be efficiently converted into VTCs using $\text{Cu}(\text{OAc})_2$ under mild conditions, this protocol represents a useful tool for the synthesis of polyfunctionalized compounds, including α -hydroxy- β -dicarbonyls and VTCs, which are useful structural units in organic and medicinal chemistry.

■ EXPERIMENTAL SECTION

General Procedure of α**-Hydroxylation.** To a solution of β-dicarbonyl compounds 1 (0.20 mmol) in toluene (2 mL), mCPBA (65 wt %, 64.0 mg, 0.24 mmol) was added, and the resultant solution was stirred for 20 h at 60 °C. The reaction mixture was washed with sat. NaHCO₃ aq. to remove m-chlorobenzoic acid, and then extracted with CH₂Cl₂ (2 × 5 mL). The combined organic layer was dried over MgSO₄, filtered, and concentrated under reduced pressure. The yield of product 2 was calculated by 1 H NMR integration of the crude product using 1,1,2,2-tetrachloroethane as an internal standard. Further purification was achieved by flash column chromatography on silica gel (hexane/EtOAc = 4/1).

In the case of large-scale reaction, lowering the product yield was observed due to the phase separation by the measurable amount of water. In such a case, mCPBA was dissolved in toluene and dried over MgSO₄ after separation with the aqueous layer.

Transformation of 2 to VTC. To a solution of α -hydroxy- β -dicarbonyl compounds 2 (0.20 mmol) in CH₂Cl₂ (2 mL) was added Cu(OAc)₂ (0.20 mmol), and the resultant mixture was stirred for 20 h at rt. The reaction mixture was passed through a silica gel short column using Et₂O as an eluent to give the corresponding α , β -oxoester and α , β -oxoamide products 3.

Ethyl 3-(4-Methoxyphenyl)-2,3-dioxopropanoate (3c):²⁵ (44.7 mg, 90%); yellow oil, $R_f = 0.14$ (silica gel, hexane/EtOAc, 4:1); Mixture of ketone and the corresponding hydrated form in ratio 1:2. Ketone: ¹H NMR (400 MHz, CDCl₃) δ 1.38 (t, J = 7.2 Hz, 3 H), 3.91 (s, 3 H), 4.41 (q, J = 7.2 Hz, 2 H), 7.00 (d, J = 8.8 Hz, 2H), 7.99 (d, J = 8.8 Hz, 2H); ¹³C NMR (100 MHz, CDCl₃) δ 14.2 (CH₃), 56.0 (CH₃), 63.4 (CH₂), 114.8 (CH), 124.9 (C), 132.9 (CH), 161.2 (C), 165.8 (C), 184.2 (C), 188.5 (C); Hydrate: ¹H NMR (400 MHz, CDCl₃) δ 1.11 (t, J = 7.2 Hz, 3 H), 3.88 (s, 3 H), 4.22 (q, J = 7.2 Hz, 2 H), 5.35 (br s, 2H), 6.94 (d, J = 8.8 Hz, 2H), 8.06 (d, J = 8.8 Hz, 2H); ¹³C NMR (100 M Hz, CDCl₃) δ 14.0 (CH₃), 55.8 (CH₃), 63.3 (CH₂), 91.8 (C), 114.3 (CH), 124.4 (C), 133.0 (CH), 165.0 (C), 170.5 (C), 190.1 (C).

Methyl 2,3-Dioxohexanoate (**3e**):²⁶ (31 mg, 88%); yellow oil, R_f = 0.26 (silica gel, hexane/EtOAc, 4:1); Mixture of ketone and the corresponding hydrated form in ratio 1:10. Hydrate: ¹H NMR (400 MHz, CDCl₃) δ 1.25 (s, 9H), 3.84 (s, 3H), 5.08 (br s, 2H); ¹³C NMR (100 M Hz, CDCl₃) δ 13.5 (CH₃), 14.0 (CH₃), 16.9 (CH₂), 40.5 (CH₂), 62.4 (CH₂), 77.8 (CH), 168.4 (C), 204.4 (C).

Methyl 4,4-Dimethyl-2,3-dioxopentanoate (3f):²⁷ (29.1 mg, 82%); yellow oil, $R_f = 0.41$ (silica gel, hexane/EtOAc, 4:1); Mixture of ketone and the corresponding hydrated form in ratio 2.6:1. Ketone: ¹H NMR (400 MHz, CDCl₃) δ 1.30 (s, 9H), 3.92 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 25.5 (CH₃), 42.7 (C), 53.3 (CH₃), 161.0 (C), 183.9 (C), 206.2 (C); Hydrate: ¹H NMR (400 MHz, CDCl₃) δ 1.25 (s, 9H), 3.84 (s, 3H), 5.08 (br s, 2H); ¹³C NMR (100 MHz, CDCl₃) δ 27.2 (CH₃), 43.1 (C), 53.5 (CH₃), 92.0 (CH), 169.9 (C), 208.1 (C).

1-Phenyl-3-(pyrrolidin-1-yl)propane-1,2,3-trione (3j): (29.0 mg, 61%); yellow oil, $R_f = 0.30$ (silica gel, hexane/EtOAc, 4:1); Mixture of ketone and the corresponding hydrated form in ratio 2.2:1. Ketone: ¹H NMR (400 MHz, CDCl₃) δ 1.93–1.97 (m, 2H), 1.99–2.04 (m, 2H), 3.58–3.62 (m, 2H), 3.61–3.78 (m, 2H), 7.52 (dd, J = 7.2, 8.0

Hz, 2H), 7.67 (t, J = 7.2 Hz, 1H), 8.00 (d, J = 8.0 Hz, 2H); 13 C NMR (100 MHz, CDCl₃) δ 23.8 (CH₂), 26.1 (CH₂), 46.1 (CH₂), 46.9 (CH₂), 128.9 (CH), 130.1 (CH), 132.2 (C), 135.1 (CH), 162.1 (C), 186.9 (C), 193.2 (C); Hydrate: 1 H NMR (400 MHz, CDCl₃) δ 1.74–1.78 (m, 4H), 3.16–3.19 (m, 2H), 3.52–3.54 (m, 2H), 7.44 (dd, J = 7.2, 8.0 Hz, 2H), 7.54 (t, J = 7.2 Hz, 1H), 8.08 (d, J = 8.0 Hz, 2H); 13 C NMR (100 M Hz, CDCl₃) δ 23.5 (CH₂), 26.0 (CH₂), 46.3 (CH₂), 47.7 (CH₂), 91.5 (C), 128.9 (CH), 130.1 (CH), 131.7 (C), 134.7 (CH), 166.8 (C), 193.9 (C); ATR-FTIR (cm⁻¹): 3141 (br), 2971 (w), 1682 (s), 1651 (s), 1645 (s), 1637 (s), 1456 (w), 1396 (w), 1215 (m), 1107 (m), 1061 (m), 982 (w). HRMS (CI+) m/z calcd. for C₁₃H₁₄NO₃: 232.0974 (M + H)⁺, found 232.0975.

- (20) α -Hydroxylation of 2,4-pentanedione did not proceed, and we could not isolate any product the same as 1d. In the case of 1,3-diphenyl-1,3-propanedione, a Baeyer–Villiger-type oxidized product was obtained in 42% yield instead of the desired product. On the other hand, no reaction was observed in the reaction using diethyl malonate under the employed reaction conditions.
