ABSTRACT: A one-pot reaction for the transformation of common secondary amides into amines with C–C bond formation is described. This method consists of *in situ* amide activation with Tf₂O–partial reduction–addition of *C*-nucleophiles. The method is general in scope, which allows employing both hard nucleophiles (RMgX, RLi) and soft nucleophiles, as well as enolates. With the use of soft nucleophiles, the reaction proceeded with high chemoselectivity at a secondary amide in the presence of ester, cyano, nitro, and tertiary amide groups.

ue to the high stability and easy availability of amides, ^{1a} secondary amides ^{1b-e} constitute a class of versatile synthetic intermediates in organic synthesis² and serve as valuable directing group in both modern C–H activation/functionalization ³ and classical C–H lithiation/functionalization reactions. ⁴ Since directing groups themselves seldom constitute a part of the target molecules, it is highly desirable to develop one-pot methods for their transformations into useful functional groups such as amines. However, little attention has been paid to the subsequent step-economical ⁵ transformations of the directing groups (amide groups) after C–H functionalizations. ^{3a,4b} Moreover, the amino group plays a pivotal role for the bioactivity of pharmaceuticals and alkaloids. ⁶ Thus, there are multiple and urgent demands for methods allowing one-pot transformation of secondary amides into amines with C–C bond formation.

However, in contrast to that of tertiary amides, ^{7–10} the onepot reductive alkylation of secondary amides remains a formidable challenge. Except for stepwise methods, 11 the reported one-pot methods only involve reductive diallylation, ^{12a-c} Schwartz reagent-mediated reductive cyanation of secondary lactams, ^{12d,e} and reductive allylation of secondary amides.96 In 2012, our group disclosed a general method for the one-pot reductive alkylation of secondary amides, 13 which is based on the amide activation with trifluoromethanesulfonic anhydride (Tf₂O)¹⁴/2-fluoropyridine (2-F-Py)¹⁵-organocerium reagent addition-reduction sequence (Scheme 1, Method A). However, the issue of chemoselectivity, one of the key challenges in modern organic synthesis, ¹⁶ has not yet been addressed in our previous method. ^{13,17} Thus, the development of a chemoselective alternative, yet complementary, partial reduction-nucleophilic addition approach (Scheme 1, Method B) is highly desirable, which has been explored, and the results are reported herein.

Scheme 1. Complementary Approaches for the General One-Pot Reductive Alkylation of Secondary Amides

Recently, 18a we have demonstrated that secondary amides, after activation with Tf2O, can be reduced by NaBH4 under mild conditions to give amines. 18 Lately, we have developed the first one-pot reductive coupling reaction of secondary amides, 19 which is based on the activations of secondary amides, partial reduction with triethylsilane (Et₃SiH),²⁰ and Kagan reagent (SmI₂)-mediated reductive coupling reactions. On the basis of these precedents, a more general one-pot reductive functionalization of secondary amides consisting of amide activationpartial reduction-addition of organometallic reagent was envisioned, and the reductive n-butylation of N-benzyl undecanamide 1a was selected for screening reaction conditions (Table 1, entry 1). The optimal conditions were defined as successive treatment of amide 1a with 2-F-Py (1.2 equiv), Tf₂O (1.1 equiv), and Et₃SiH (1.1 equiv) at 0 °C, followed by addition of BF₃·OEt₂ (1.5 equiv) and n-butyl Grignard reagent (4.0 equiv) at 0 °C for 2 h. In such a manner, amine 2a was obtained in 90% yield (Scheme 2). It is worth to

note that, in the absence of $BF_3 \cdot OEt_2$, the product was obtained in a low yield (20%).

With the optimal conditions defined, the scope of the reaction was examined, and the results are summarized in Table 1. Similar to the reductive *n*-butylation of 1a (Table 1, entry 1), *n*-butylation of aliphatic amides 1b and 1c produced the corresponding amines in 92% and 81% yield, respectively. The lower yield of 2c compared with those of 2a and 2b is attributable to the volatility of the amine. Benzamides and *p*-methylbenzamide reacted similarly to give amines 2d–g in 82–

83% yields (entries 4-7). The reaction worked well with amides bearing different N-alkyl groups ranging from primary (Bn, n-Bu, Me) to secondary (i-Pr, c-hex) alkyl groups. The reductive alkylation of amide 1a with Grignard reagents prepared from primary alkyl (entry 1), primary alkenyl (entry 8), and secondary alkyl (entry 9) halides worked similarly to give the corresponding amines 2a, 2h, and 2i in 90-94% yields. Ethyl, benzyl, and allyl magnesium bromides also reacted smoothly to give the corresponding amines 2j-n (entries 10-14). The reaction was shown to tolerate para-methoxy and para-bromo substituents on the phenyl ring of benzamides (68% and 62%, entries 15 and 16). It is noteworthy that, besides Grignard reagents, organolithium reagents can also serve as effective nucleophiles in the reductive functionalization (entries 17–20). In particular, reductive alkynylation proceeded smoothly to give the corresponding propargylamines 2q-s (entries 18-20), which are important structural motifs in natural products and pharmaceuticals, and are versatile synthetic intermediates.²¹ Surprisingly, the attempted introduction of simple ethenyl, ethynyl, and phenyl groups was, at the current stage, unsuccessful (entries 21 and 22). Significantly, reductive functionalization of la with enolate derived from ethyl acetate underwent smoothly to give β aminoester 2t in 82% yield (entry 23), thus providing an alternative method for the synthesis of biologically important β amino acids.²²

Having demonstrated the viability of the present method for the one-pot reductive alkylation of the C-H functionalization products, we next focused on the issue of the chemoselective reductive alkylation of secondary amides. To simplify the problem, para-substituted benzamide derivatives were selected as substrates. 10d,e To further explore the functional group tolerance, the use of softer carbon nucleophiles was investigated. As can be seen from Table 2, reductive allylation of 1a with allyltributyltin proceeded smoothly to give 2u in 90% yield (Table 2, entry 1). For p-substituted benzamides bearing functional groups ranging from methoxyl, ester, cyano, to nitro, the reductive allylation reactions proceeded chemoselectively on the secondary amide, producing the corresponding amines in good yields (entries 2-5). At appropriate activation temperatures, the reductive alkylation of secondary amides proceeded chemoselectively in the presence of tertiary amide, which remained intact (entry 6). When using 5.0 mol equiv of allyltributyltin, the di-sec-amide underwent bisreductive allylation to give diamine 2aa in 89% yield (entry 7). The reaction was incompatible with an acetyl group (entry 8). Attempted addition of allyltrimethylsilane (entry 9) failed to give the desired product; instead, after work up, pmethoxybenzaldehyde was isolated in an 86% yield. Use of TMSCN as the carbon nucleophile also afforded the desired α amino nitrile 2ab in 53% yield (entry 10).

Encouraged by these results, we next turned to the more challenging chemoselective reductive alkylation of alicyclic amido ester 1q. To our delight, the reductive allylation of The Journal of Organic Chemistry

amido ester 1q proceeded uneventfully to give the amino ester 2ac in 88% yield (entry 11). It is worthy of mentioning that N- α -allyl secondary amines are, in turn, useful substrates for the synthesis of N-heterocycles for which a number of methods have been developed.²³

To establish a tighter linkage between the present method with the secondary amide-directed C-H activation methodology, some substrates and/or products of C-H functionalization were tested for the reductive alkylation. We first examined the reaction of amide 1r, prepared by Beak's amide directed C-H alkylation. 4b Following the general procedure, the reductive alkylation proceeded smoothly to give the expected amine 2ad in 84% yield as a 1:1 diastereomeric mixture (Table 3, entry 1). N-Methyl and N-iso-propyl benzamides 1e and 1s are substrates used by Daugulis, Nakamura, and co-workers for the C-H activation and functionalization. ^{3a,c} Their reductive *n*-butylation proceeded smoothly to give amines 2e and 2ae in 82% and 80% yield, respectively (Table 3, entries 2 and 3). Subjection of benzamide 1t, a C-H functionalization product prepared by Nakamura's method,3c to the reductive alkylation also gave amine 2af in 77% yield (entry 4).

A plausible mechanism for the one-pot reductive functionalization of secondary amides is depicted in Scheme 3. The IR

evidence gained by Movassaghi, 15 and our previous results 19b allow us to suggest the formation of nitrinium ion intermediate A along with 2-fluoropyridinium salt B upon treatment of secondary amides with Tf₂O. The highly electrophilic nitrinium ion intermediate A is reduced with Et₃SiH to give imine C. A proton exchange between the protonated 2-F-pyridine B and more basic imine C results in iminium ion D and regenerates 2-F-pyridine. The iminium ion D consumes an equivalent of nucleophile by proton exchange to yield back imine C. The low reactivity of imines toward Grignard reagents is well-known. Thus, the employment of a Lewis acid is necessary to convert the imine C to the reactive chelating species E, which is subjected to nucleophilic addition to yield the desired amine 2. The proton exchange between iminium ion D and nonbasic nucleophiles is less evident. However, this is supported by the fact that, in the absence of BF₃·OEt₂ reductive allylation of 1a, and reductive cyanation of 1j gave the corresponding products 2u and 2ab in only 12% and 20% yield, respectively, whereas, in the presence of BF₃·OEt₂, the yields are 90% (Table 2, entry 1) and 53% (Table 2, entry 10), respectively.

Compared with our previous reductive alkylation method (Method A in Scheme 1), the advantages of the present method reside in its chemoselectivity. In fact, attempted reductive butylation of benzamide 1u by Method A was unsuccessful (Scheme 4). trace of the desired ketone **2ah**. In addition, for stereoselective reductive alkylation of substrates bearing chiral elements, it can be expected that two methods, with inversed order of addition of two nucleophiles, will give complementary stereochemical outcomes.

In summary, we have developed a new and general method for the one-pot reductive functionalization of secondary amides, which is complementary to the method we developed recently. This method allows using a variety of nucleophiles, including hard nucleophiles, such as RMgX and RLi, and soft nucleophiles, such as TMSCN, allyltributyltin, as well as enolate. The reaction tolerates many sensitive functional groups, and a number of functional groups bearing amines have been synthesized in one-pot. The method has been applied to the transformations of selected C-H functionalization products (1r, 1t) and C-H functionalization starting materials (1e, 1s). We thus established a connection with the C-H functionalization products, which renders the latter methodology more step-economical.

■ EXPERIMENTAL SECTION

Mass spectra were recorded on an LC-MS apparatus. HRFABMS spectra were recorded on a 7.0 T FT-MS. 1 H NMR and 13 C NMR spectra were recorded at 400 and 100 MHz, respectively. Chemical shifts (δ) are reported in ppm and respectively referenced to the internal standard Me₄Si and solvent signals (Me₄Si, 0 ppm for 1 H NMR and CDCl₃, 77.0 ppm for 13 C NMR). Infrared spectra were measured using film KBr pellet techniques. Silica gel (300–400 mesh) was used for flash column chromatography (FC), eluting (unless otherwise stated) with ethyl acetate/hexane mixture. Trifluoromethanesulfonic anhydride (Tf₂O) was distilled over phosphorus pentoxide and was stored for no more than a week before redistilling. All other commercially available compounds were used as received. Anhydrous dichloromethane was distilled over calcium hydride under argon. All reactions were carried out under argon. All the Grignard reagents were titrated immediately before use. 24

General Procedure for the One-Pot Transformation of Secondary Amides 1 into Secondary Amines 2. Into a dry 10 mL round-bottom flask equipped with a stirring bar were added successively an amide (1.0 mmol, 1.0 equiv), 4 mL of anhydrous dichloromethane, and 2-fluoropyridine (116.5 mg, 103 μ L, 1.2 mmol, 1.2 equiv). After being cooled to 0 °C, trifluoromethanesulfonic anhydride (Tf₂O) (310 mg, 185 $\mu \rm L$, 1.1 mmol, 1.1 equiv) was added dropwise via a syringe at 0 °C and the reaction was stirred for 20 min. To the resulting mixture, triethylsilane (Et₃SiH) (128 mg, 176 μ L, 1.1 mmol, 1.1 equiv) was added dropwise at 0 °C, and the reaction was stirred for 10 min. The mixture was allowed to warm-up to room temperature and stirred for 5 h. After being cooled to 0 °C, BF₃·Et₂O (213 mg, 185 μ L, 1.5 mmol, 1.5 equiv) was added, and the reaction mixture was stirred for 30 min. RMgX or RLi (4.0 mmol, 4.0 equiv) or allyltributyltin (3.0 mmol, 3.0 equiv) was added dropwise to the resultant mixture at 0 $^{\circ}\text{C}$. Then, the reaction mixture was warmed slowly to rt. and stirred for 2 h. The reaction was quenched with a saturated aqueous solution of ammonium chloride and extracted with

dichloromethane (3×5 mL). The combined organic layers were dried over anhydrous Na₂SO₄, filtered, and concentrated under reduced pressure. The residue was purified by flash column chromatography on silica gel to afford the desired amine **2**.

N-Benzylpentadecan-5-amine (*2a*). Following the general procedure, the reductive alkylation of amide 1a (275 mg, 1.0 mmol) with *n*BuMgBr gave, after flash column chromatography on silica gel (eluent: EtOAc/*n*-hexane = 1/50), amine 2a (285 mg, yield: 90%). N-Benzyltetradec-1-en-4-amine (*2u*). Following the general procedure, the reductive alkylation of amide 1a (275 mg, 1.0 mmol) with AllylSnBu₃ gave, after flash column chromatography on silica gel (eluent: EtOAc/*n*-hexane = 1/20), amine 2u (271 mg, yield: 90%). Colorless oil. IR (film) ν_{max} : 3365, 3067, 3029, 2955, 2922, 2855, 1457, 73, 736, 690 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 0.88 (t, J = 6.9 Hz, 3H), 1.20–1.50 (m, 18H), 2.12–2.32 (m, 2H), 2.56–2.65 (m, 1H), 3.77 (s, 2H), 5.04–5.12 (m, 2H), 5.72–5.85 (m, 1H), 7.20–7.35 (m, 5H) ppm; ¹³C NMR (100 MHz, CDCl₃) δ 14.1, 22.7, 25.7, 29.3, 29.6 (3C), 29.9, 31.9, 33.9, 38.3, 51.2, 56.2, 117.1, 126.8, 128.1 (2C), 128.3 (2C), 135.8, 140.8 ppm; HRMS (ESI) calcd for [C₂₁H₃₆N]⁺ (M + H⁺): 302.2842; found: 302.2844.

N-[1-(4-Methoxyphenyl)but-3-en-1-yl]cyclohexanamine (*2v*). Following the general procedure, the reductive alkylation of amide 1j (233 mg, 1.0 mmol) with AllylSnBu₃ gave, after flash column chromatography on silica gel (eluent: EtOAc/*n*-hexane = 1/50), amine 2v (255 mg, yield: 87%). Colorless oil. IR (film) ν_{max} : 3328, 3071, 2996, 2926, 2847, 1611, 1511, 1466, 1241, 1103, 827 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 0.94–1.18 (m, 5H), 1.44–1.71 (m, 4H), 1.91–2.00 (m, 1H), 2.20–2.29 (m, 1H), 2.30–2.40 (m, 2H), 3.80 (s, 3H), 3.76–3.83 (m, 1H), 4.99–5.10 (m, 2H), 5.62–5.75 (m, 1H), 6.86 (d, *J* = 8.6 Hz, 2H), 7.22 (d, *J* = 8.6 Hz, 2H) ppm; ¹³C NMR (100 MHz, CDCl₃) δ 24.9, 25.2, 26.1, 32.9, 34.7, 43.5, 53.4, 55.2, 58.3, 113.6 (2C), 117.2, 128.0 (2C), 135.8, 136.7, 158.4 ppm; HRMS (ESI) calcd for [C₁₇H₂₆NO]⁺ (M + H⁺): 260.2009; found: 260.2009.

Methyl 4-[1-(Cyclohexylamino)but-3-en-1-yl]benzoate (*2w*). Following the general procedure, the reductive alkylation of amide 1k (261 mg, 1.0 mmol) with AllylSnBu₃ gave, after flash column chromatography on silica gel (eluent: EtOAc/*n*-hexane = 1/20), amine 2w (241 mg, yield: 84%). Colorless oil. IR (film) ν_{max} : 3324, 3083, 2976, 2926, 2847, 1723, 1611, 1433, 1279, 1109, 769, 703 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 0.92–1.18 (m, 5H), 1.30–1.70 (m, 4H), 1.89–1.98 (m, 1H), 2.16–2.26 (m, 1H), 2.28–2.43 (m, 2H), 3.90 (s, 3H), 3.87–3.93 (m, 1H), 5.01–5.11 (m, 2H), 5.61–5.74 (m, 1H), 7.40 (d, *J* = 8.3 Hz, 2H), 7.99 (d, *J* = 8.3 Hz, 2H) ppm; ¹³C NMR (100 MHz, CDCl₃) δ 24.8, 25.1, 26.1, 32.9, 34.7, 43.3, 51.9, 53.9, 59.0, 117.8, 127.1 (2C), 128.7, 129.6 (2C), 135.1, 150.4, 167.1 ppm; HRMS (ESI) calcd for [C₁₈H₂₆NO₂]⁺ (M + H⁺): 288.1958; found: 288.1962.

4-[1-(Cyclohexylamino)but-3-en-1-yl]benzonitrile (2x). Following the general procedure, the reductive alkylation of amide 11 (228 mg, 1.0 mmol) with AllylSnBu₃ gave, after flash column chromatography on silica gel (eluent: EtOAc/n-hexane = 1/10), amine 2w (211 mg, yield: 83%). Colorless oil. IR (film) ν_{max} : 3328, 3075, 3046, 2926, 2847, 2221, 1607, 1263, 732 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 0.94–1.20 (m, 5H), 1.40–1.74 (m, 4H), 1.87–1.97 (m, 1H), 2.14–2.23 (m, 1H), 2.25–2.40 (m, 2H), 3.90 (dd, J = 7.8, 5.7 Hz, 1H), 5.03–5.12 (m, 2H), 5.60–5.74 (m, 1H), 7.45 (d, J = 8.2 Hz, 2H), 7.61 (d, J = 8.2 Hz, 2H) ppm; ¹³C NMR (100 MHz, CDCl₃) δ 24.8, 25.1, 26.0, 32.9, 34.7, 43.3, 54.0, 59.0, 110.5, 118.2, 119.0, 127.9 (2C), 132.1 (2C), 134.6, 150.9 ppm; HRMS (ESI) calcd for [C₁₇H₂₂N₂]⁺ (M + H⁺): 255.1856; found: 255.1857.

N-[1-(4-Nitrophenyl)but-3-en-1-yl]cyclohexanamine (*2y*). Following the general procedure, the reductive alkylation of amide 1m (248 mg, 1.0 mmol) with AllylSnBu₃ gave, after flash column chromatography on silica gel (eluent: EtOAc/*n*-hexane = 1/10), amine 2y (222 mg, yield: 81%). Yellow oil. IR (film) ν_{max} : 3328, 3071, 2925, 2851, 1607, 1524, 1346, 857, 694 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 0.94–1.18 (m, 5H), 1.44–1.74 (m, 4H), 1.88–1.98 (m, 1H), 2.15–2.24 (m, 1H), 2.25–2.43 (m, 2H), 3.96 (dd, *J* = 7.8, 5.7 Hz, 1H), 5.04–5.12 (m, 2H), 5.62–5.75 (m, 1H), 7.52 (d, *J* = 8.7 Hz, 2H), 8.18 (d, *J* = 8.7 Hz, 2H) ppm; ¹³C NMR (100 MHz, CDCl₃) δ 24.8, 25.1, 26.0, 32.9, 34.7, 43.3, 54.1, 58.8, 118.3, 123.5 (2C), 127.9 (2C), 134.5, 146.9, 153.1 ppm; HRMS (ESI) calcd for [C₁₆H₂₃N₂O₂]⁺ (M + H⁺): 275.1754; found: 275.1758.

4-[1-(Butylamino)but-3-en-1-yl]-N,N-diethylbenzamide (2z). Following the general procedure, change the activated procedure into: amide 1n was activated at $-78~^{\circ}\text{C}$, stirred for 20 min, then keeping at $-20~^{\circ}\text{C}$ for 20 min, and 0 $^{\circ}\text{C}$ for 10 min. The reductive alkylation of amides 1n (276 mg, 1.0 mmol) with AllylSnBu₃ gave, after flash column chromatography on silica gel (eluent: EtOAc/n-hexane = 1/2), amine 2z (232 mg, yield: 77%). Colorless oil. IR (film) ν_{max} : 3320, 3083, 2959, 2926, 2864, 1636, 1466, 1300, 1101, 840 cm $^{-1}$; ^{1}H NMR (400 MHz, CDCl₃) δ 0.86 (t, J=7.4 Hz, 3H), 1.13 (br s, 3H), 1.19–1.35 (m, 5H), 1.37–1.47 (m, 2H), 1.66 (br s, 1H), 2.31–2.47 (m, 4H), 3.28 (br s, 2H), 3.55 (br s, 2H), 3.66 (dd, J=7.4, 6.1 Hz, 1H), 5.02–5.13 (m, 2H), 5.64–5.77 (m, 1H), 7.34 (s, 4H) ppm; ^{13}C NMR (100 MHz, CDCl₃) δ 12.8, 13.9, 14.2, 20.4, 32.2, 39.2, 42.9, 43.2, 47.4, 62.4, 117.6, 126.4 (2C), 127.1 (2C), 135.2, 135.8, 145.4, 171.3 ppm; HRMS (ESI) calcd for $[\text{C}_{19}\text{H}_{31}\text{N}_2\text{O}]^+$ (M + H $^+$): 303.2431; found: 303.2429.

1,1'-(1,4-Phenylene)bis(N-butylbut-3-en-1-amine) (2aa). Following the general procedure, the reductive alkylation of amide 1o (276 mg, 1.0 mmol) with AllylSnBu₃ gave, after flash column chromatography on silica gel (eluent: EtOAc/n-hexane = 1/10), amine 2aa (292 mg, yield: 89%). Colorless oil. IR (film) $\nu_{\rm max}$: 3324, 3075, 2959, 2926, 2868, 2851, 2810, 1644, 1466, 1122, 927 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 0.86 (t, J = 7.3 Hz, 6H), 1.24–1.47 (m, 8H), 1.53–1.72 (m, 2H), 2.33–2.49 (m, 8H), 3.62 (dd, J = 7.3, 6.3 Hz, 2H), 5.00–5.13 (m, 4H), 5.64–5.79 (m, 2H), 7.24 (s, 4H) ppm; ¹³C NMR (100 MHz, CDCl₃) δ 13.9 (2C), 20.4 (2C), 32.2 (2C), 42.9 (2C), 47.4 (2C), 62.4 (2C), 117.3 (2C), 127.0 (4C), 135.6 (2C), 142.6 (2C) ppm; HRMS (ESI) calcd for $[C_{12}H_{37}N_2]^+$ (M + H⁺): 329.2951; found: 329.2956.

2-(Cyclohexylamino)-2-(4-methoxyphenyl)acetonitrile (2ab). Following the general procedure, the reductive alkylation of amide 1j (233 mg, 1.0 mmol) with TMSCN gave, after flash column chromatography

on silica gel (eluent: EtOAc/n-hexane = 1/5), amine **2ab** (129 mg, yield: 53%). Colorless oil. IR (film) ν_{max} : 3338, 3071, 2996, 2926, 2847, 2221, 1511, 1466, 1241, 827 cm⁻¹; 1 H NMR (400 MHz, CDCl₃) δ 1.07–1.38 (m, 5H), 1.59–1.67 (m, 1H), 1.70–1.82 (m, 3H), 1.93–2.03 (m, 1H), 2.79–2.90 (m, 1H), 3.81 (s, 3H), 4.78 (s, 1H), 6.91 (d, J = 8.7 Hz, 2H), 7.42 (d, J = 8.7 Hz, 2H) ppm; 13 C NMR (100 MHz, CDCl₃) δ 24.2, 24.6, 25.9, 31.9, 33.8, 51.0, 54.7, 55.3, 114.2 (2C), 119.5, 128.4 (2C), 131.9, 159.9 ppm; HRMS (ESI) calcd for $[C_{15}H_{21}N_2O]^+$ (M + H $^+$): 245.1648; found: 245.1647.

Methyl 3-[(1-Phenylbut-3-en-1-yl)amino]propanoate (2ac). Following the general procedure, the reductive alkylation of amide 1q (207 mg, 1.0 mmol) with AllylSnBu₃ gave, after flash column chromatography on silica gel (eluent: EtOAc/n-hexane = 1/2), amine 2ac (205 mg, yield: 88%). Colorless oil. IR (film) $\nu_{\rm max}$: 3332, 3079, 3025, 2976, 2942, 2922, 2843, 1727, 1445, 1167, 765, 711 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 1.93 (br s, 1H), 2.31–2.52 (m, 4H), 2.64–2.77 (m, 2H), 3.62–3.70 (m, 4H), 5.01–5.13 (m, 2H), 5.65–5.78 (m, 1H), 7.20–7.37 (m, 5H) ppm; ¹³C NMR (100 MHz, CDCl₃) δ 34.5, 42.7, 43.0, 51.5, 62.3, 117.5, 127.0, 127.1 (2C), 128.2 (2C), 135.3, 143.6, 173.2 ppm; HRMS (ESI) calcd for [C₁₄H₁₉NNaO₂]⁺ (M + Na⁺): 256.1308; found: 256.1303.

N-Isopropyl-6-phenylhept-1-en-4-amine (2ad). Following the general procedure, the reductive alkylation of amide 1r (205 mg, 1.0 mmol) with AllylSnBu₃ gave, after flash column chromatography on silica gel (eluent: EtOAc/n-hexane = 1/5), amine 2ad (194 mg, dr = 1:1, yield: 84%). Colorless oil. IR (film) ν_{max} : 3320, 3083, 3067, 3025, 2959, 2930, 2868, 1453, 1379, 1176, 765, 703 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 0.89 (d, J = 6.3 Hz, 3H), 1.01 (d, J = 6.3 Hz, 3H), 1.23 (d, J = 7.0 Hz, 3H), 1.48–1.57 (m, 1H), 1.67–1.77 (m, 1H), 2.04–2.19 (m, 2H), 2.44–2.52 (m, 1H), 2.74–2.85 (m, 1H), 7.14–7.22 (m, 3H), 7.25–7.32 (m, 2H) ppm; ¹³C NMR (100 MHz, CDCl₃) δ 23.0, 23.2, 23.9, 36.7, 38.8, 43.4, 45.2, 51.7, 117.2, 125.9, 127.1 (2C), 128.3 (2C), 135.4, 147.4 ppm; HRMS (ESI) calcd for $[C_{16}H_{26}N]^+$ (M + H⁺): 232.2060; found: 232.2055.

N-Isopropyl-1-(p-tolyl)pentan-1-amine (2ae). Following the general procedure, the reductive alkylation of amide 1s (177 mg, 1.0 mmol) with *n*BuMgBr gave, after flash column chromatography on silica gel (eluent: EtOAc/*n*-hexane = 1/20), amine 2ae (175 mg, yield: 80%). Colorless oil. IR (film) $\nu_{\rm max}$: 3316, 3046, 2955, 2926, 2859, 1462, 1375, 1176, 818 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 0.83 (t, *J* = 7.1 Hz, 3H), 0.92 (d, *J* = 6.3 Hz, 3H), 1.00 (d, *J* = 6.3 Hz, 3H), 1.06–1.13 (m, 1H), 1.20–1.30 (m, 3H), 1.51–1.61 (m, 1H), 1.65–1.80 (m, 2H), 2.33 (s, 3H), 2.54–2.62 (m, 1H), 3.63 (dd, *J* = 8.0, 5.9 Hz, 1H), 7.08–7.16 (m, 4H) ppm; ¹³C NMR (100 MHz, CDCl₃) δ 13.9, 21.0, 21.9, 22.7, 24.2, 28.6, 38.4, 45.4, 60.0, 127.0 (2C), 128.9 (2C), 136.2, 141.8 ppm; HRMS (ESI) calcd for [C₁₅H₂₆N]⁺ (M + H⁺): 220.2060; found: 220.2061.

1-(2-Ethylphenyl)-N-isopropyl-3-methylbut-3-en-1-amine (2af). Following the general procedure, the reductive alkylation of amide 1t (191 mg, 1.0 mmol) with 2-methylallylmagnesium chloride gave, after flash column chromatography on silica gel (eluent: EtOAc/n-hexane = 1/20), amine 2af (178 mg, yield: 77%). Colorless oil. IR (film) ν_{max} : 3316, 3067, 3021, 2963, 2930, 2868, 1657, 1470, 1445, 1371, 898, 753 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 0.95 (d, J = 6.3 Hz, 3H), 1.02 (d, J = 6.3 Hz, 3H), 1.26 (t, J = 7.6 Hz, 3H), 1.77 (s, 3H), 2.18–2.30 (m, 2H), 2.52–2.63 (m, 1H), 2.64–2.81 (m, 2H), 4.22 (dd, J = 8.7, 4.9 Hz, 1H), 4.80–4.88 (m, 2H), 7.13–7.24 (m, 3H), 7.56–7.62 (m, 1H) ppm; ¹³C NMR (100 MHz, CDCl₃) δ 15.6, 22.0, 22.3, 24.3, 25.2, 46.0, 47.3, 52.1, 113.2, 126.0, 126.4, 126.4, 128.4, 141.1, 142.6, 143.0 ppm; HRMS (ESI) calcd for $[C_{16}H_{26}N]^+$ (M + H*): 232.2060; found: 232.2059.
