Supporting Information

ABSTRACT: The combination of a catalytic amount of InCl₃ and acetic anhydride remarkably promotes the Knoevenagel condensation of a variety of aldehydes and activated methylene compounds. This catalytic system accommodates aromatic aldehydes containing a variety of electron-donating and -withdrawing groups, heteroaromatic aldehydes, conjugate aldehydes, and aliphatic aldehydes. Central to successfully driving

the condensation series is the formation of a geminal diacetate intermediate, which was generated in situ from an aldehyde and an acid anhydride with the assistance of an indium catalyst.

INTRODUCTION

The Knoevenagel reaction is a condensation between activated methylene and carbonyl compounds in the presence of a weak base, such as an amine; it is a powerful and practical tool for the formation of a carbon-carbon double bond.¹ Because the multisubstituted alkenes that are produced can further be used for a variety of molecular transformations, such as Michael additions and Diels-Alder reactions, a number of organic chemists have continuously improved this useful conversion.^{1d} In a typical Knoevenagel condensation, a catalytic amount of primary or secondary amines along with their ammonium salts acts as an effective promoter, in which the formation of the iminium intermediate derived from the amine and a carbonyl compound plays a central role in promoting condensation.² During the past two decades, several Lewis acid catalysts have been used to promote Knoevenagel condensations.³ In general, however, aldehydes with coordinating functional groups, such as methoxy, nitro, or cyano groups, and heterocyclic aldehydes are unsuitable for use as a substrate in a Lewis-acid-catalyzed Knoevenagel condensation with activated methylene that has a relatively low degree of acidity, such as dimethyl malonate $(pK_a = 15.9 \text{ in DMSO})$.⁴ This is probably due to deactivation of the acidic catalyst by coordination rather than by activation of the carbonyl compound that is used.

Indium compounds are known to display a high tolerance for functional groups.⁵ We have joined several other researchers in reporting on indium-catalyzed conversions of various carbonyl compounds with a variety of functional groups.⁶ On the basis of these reports, we anticipated that the indium compound that shows unique activation of typical carbonyl compounds will effectively promote a Knoevenagel condensation with a weak carbonyl compound that includes a coordinating functional group.⁷ Herein, we report a novel catalytic system composed of indium chloride and acetic anhydride that effectively promotes the Knoevenagel condensation of aromatic/aliphatic/heteroaro-

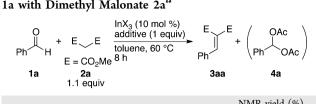

matic aldehydes with a variety of activated methylene compounds, leading to the preparation of substituted alkene derivatives. We also describe how the condensation series proceeds via the indium-promoted formation of a geminal diacetate intermediate that is derived from an aldehyde with acetic acid anhydride.

RESULTS AND DISCUSSION

On the basis of conventional Knoevenagel reactions, we initially investigated reaction conditions using benzaldehyde (1a) and dimethyl malonate (2a) as a model substrate (Table 1). When a reaction was performed with 10 mol % of InBr3 in toluene at 60 °C for 8 h, only 3% of Knoevenagel product 3aa was detected (entry 1). Thus, to promote the initial abstraction of the activated proton, the addition of 1 equiv of several bases to the reaction mixture was examined. Consequently, when the primary amine 2-aminoethanol was added, the yield was remarkably increased to 61% (entry 2). The addition of a secondary or tertiary amine, however, was ineffective for the present condensation (entries 3 and 4). Upon further screening several additives for the condensation reaction,⁸ 1 equiv of acetic anhydride showed the best additive effect to afford corresponding product 3aa in 89% yield (entry 5). Then, a counteranion effect of the indium catalyst was investigated in the presence of Ac₂O. InCl₃ produced the best yield of Knoevenagel product 3aa in 94% NMR yield (86% isolated yield) along with the formation of a small amount (4%) of geminal diacetate 4a. Stronger Lewis acids, InI_3 and $In(OTf)_3$, showed a similar catalytic effect and provided alkene 3aa in 79% (with 8% of diacetate 4a) and 82% yields, respectively (entries 7 and 8); however, $In(OH)_3$ and $In(OAc)_3$ produced neither the corresponding alkene 3aa nor diacetate

^aReaction conditions: **1a** (0.60 mmol), **2a** (0.66 mmol), InX_3 (0.060 mmol), additive (0.60 mmol), toluene (0.60 mL), 60 °C, 8 h. ^bNot detected. ^cIsolated yield.

4a (entries 9 and 10). Without an indium salt, Ac_2O did not undergo the expected condensation to yield a Knoevenagel product (entry 11). When the reaction was conducted with other solvents, such as CHCl₃, CH₃CN, CH₃OH, and THF, remarkable improvement in the yield of **3aa** was not observed.⁹

The general application of aromatic aldehydes 1 for a Knoevenagel condensation with dimethyl malonate (2a) was next investigated in toluene at 60 °C for 8 h (Table 2). Aldehydes containing a strong electron-donating group, such as either Me₂N or MeO groups, on the benzene ring afforded the corresponding products 3ba-3ea in good yields (entries 1-4). During the condensation series, neither the amino nor the methoxy groups, which generally deactivate a typical Lewis acid via coordination, had an effect on the activation by InCl₃. Similarly, 4-methyl- and 4-phenyl-substituted aromatic aldehydes also undertook the condensation to produce alkenes 3fa and 3ga in 80 and 84% yields, respectively, within 5-7 h (entries 5 and 6). The catalytic condensation of halogensubstituted benzaldehydes 1h-1l with malonate 2a proceeded successfully to isolate adducts 3ha-3la in excellent yields (entries 7-11). Benzaldehyde derivatives bearing an electronwithdrawing group, such as a methoxycarbonyl, trifluoromethyl, cyano, or nitro group, generally showed slightly higher reactivity than benzaldehydes with an electron-donating group to give the Knoevenagel products 3ma-3ra in 80-98% yields (entries 12-17). When salicylaldehyde (1s) was used as a substrate, the expected Knoevenagel alkene product was not detected. Instead, further O-acetylated product 5 and an intramolecular cyclization product, coumarin derivative 6, were obtained in 40 and 7% yields, respectively (entry 18). For the substrates shown in Table 2, a small amount of the corresponding diacetate 4 was detected by ¹H NMR analysis.

To expand on the scope of an activated methylene derivative, we conducted an InCl₃-catalyzed Knoevenagel condensation of benzaldehyde (1a) with several methylene compounds 2 in the presence of Ac₂O (Table 3). For example, the reaction of benzaldehyde with β -ketoester methyl acetoacetate (2b) and ethyl benzoylacetate (2c) efficiently gave the Knoevenagel

products 3ab (E:Z = 42:58) and 3ac (E:Z = 10:90).¹⁰ β -Ketoamide 2d afforded desired product 3ad in a rather low yield¹¹ at an extended reaction time of 30 h, possibly because a decrease in the nucleophilicity of the methylene moiety by an electron-donating effect of the amino group hindered the reaction of the methylene with geminal diacetate. It was remarkable, however, that when the condensation was carried out with malonic acid (2e), 2-benzylidene-malonic acid (3ae) was obtained in 79% yield without a Doebner-type decarboxvlation.¹² Also, when the reaction of malononitrile (2f) was carried out in toluene, only 15% (NMR yield) of the product was obtained. It was interesting that the use of N.N-dimethylformamide (DMF) as a solvent instead of toluene successfully improved the chemical yield of alkene 3af to 86%. When the condensation of **1a** with the cyclic 1,3-diketone dimedone (**2g**) was conducted under the optimal conditions, 1:2 adduct 7 (a xanthenedione derivative) was isolated as the sole product, which otherwise would have been produced via a further Michael addition of 2g to the first Knoevenagel adduct and a subsequent intramolecular cyclodehydration.^{7g}

Further application of the indium-catalyzed condensation to a variety of aldehydes 8, except for benzaldehyde with dimethyl malonate (2a), was then investigated in the presence of Ac₂O (Table 4). When 4-formylpyridine (8a) was used as a substrate, the corresponding alkene product 9aa was obtained in 65% yield (entry 1). In this case, InCl₃ was unnecessary for the condensation based on the fact that alkene 9aa (68% NMR yield) was obtained in the absence of InCl₃. When the reactions of either a pyridyl aldehyde, which have a more sterically hindered portion around the nitrogen atom, 2-bromo-6-formylpyridine (8b), or 2-thiophenyl aldehyde (8c) with malonate ester 2awere treated with our optimal conditions, the extended π -conjugate heteroaromatic compounds 9ba and 9ca were obtained in good yields (entries 2 and 3). Also, the present Knoevenagel condensation could be applied to either a conjugated or an aliphatic aldehyde in addition to an aromatic aldehyde. For example, a conjugated aldehyde, (E)-cinnamaldehyde (8d), reacted with the malonate ester to afford α , β , γ , $\delta\text{-unsaturated}$ carbonyl compound 9da in 79% yield, which retained the double-bond geometry (entry 4). The reactions of linear aliphatic aldehydes 8e and 8f were completed within 24 h to give the corresponding products 9ea and 9fa in good yields (entries 5 and 6). Moreover, when α -branched aldehydes 8g-8j were reacted with malonate 2a, the expected alkenes 9ga-9ja, respectively, were produced in 68-72% yields (entries 7-10).

As control experiments, the reaction of benzaldehyde (1a) with 1 equiv of Ac₂O was conducted both with and without $InCl_3$ (eq 1 in Scheme 1). In the former reaction, the corresponding geminal diacetate 4a was quickly obtained in 91% yield at room temperature, but in the latter reaction, no formation of diacetate 4a nor any other byproducts were observed. Moreover, to find out whether geminal diacetate 4a would be an intermediate in the Knoevenagel reaction series,¹³ the reaction of 4a with dimethyl malonate 2a was next examined both with and without InCl₃. Consequently, Knoevenagel adduct 3aa was obtained in 79% yield in the presence of a catalytic amount of InCl₃, but the reaction without the indium catalyst did not produce the corresponding product along with the recovery of starting diacetate 4a (eq 2 in Scheme 1). These results indicate that geminal diacetate 4a is one of the intermediates in the Knoevenagel condensation and proves that the indium catalyst is necessary for both stages Table 2. involving the generation of 4a from aldehyde and Ac_2O as well as a subsequent reaction of 4a with malonate 2a.

On the basis of the results obtained by the control experiments, a plausible reaction mechanism for the present condensation is shown in Scheme 2. When aldehyde 1 is activated by an indium catalyst, it initially reacts with Ac_2O to form geminal diacetate 4,¹⁴ the formation of which facilitates a subsequent nucleophilic attack of an enolizable activated methylene compound in the presence of the indium catalyst¹⁵ to produce intermediate **A**. Finally, intramolecular elimination of acetic acid occurs to afford substituted alkene **3** along with regeneration of the indium catalyst.

CONCLUSIONS

In conclusion, we have demonstrated an indium-catalyzed Knoevenagel condensation between aldehydes with activated methylene compounds in the presence of acetic acid anhydride, leading to the preparation of polysubstituted alkenes. Also, we have clarified that to drive the Knoevenagel condensation series forward, in situ formation of a geminal diacetate intermediate derived from an aldehyde and acetic anhydride is essential. To date, several examples involving the conversion of aldehydes to geminal diacetates or the synthesis of Knoevenagel products from geminal diacetates have been reported. This novel procedure presents one-pot access to Knoevenagel products from various aldehydes via geminal diacetate as a key intermediate. Also, in conventional Lewis acid-catalyzed Knoevenagel condensations, substrates were limited to mainly either aldehydes bearing a noncoordinating functional group or activated methylenes with relatively high acidic hydrogen. With the present catalytic system in hand, therefore, the carbonyl compounds used in the Knoevenagel condensation could be extensively expanded to heteroaromatic, conjugate, and aliphatic aldehydes, including a variety of benzaldehydes. Moreover, we disclosed that the present method could be applied to various activated methylenes other than a malonate ester. The use of an indium compound with a unique and high tolerance to various functional groups allowed for extension of the substrate and a new entry for the preparation of valuable substituted alkenes. Further attempts to elucidate the reaction mechanism and extend the substrate scope are now in progress.

EXPERIMENTAL SECTION

General Information. All reactions were carried out under a N_2 atmosphere. Toluene and *N*,*N*-dimethylformamide (DMF) were freshly distilled from CaH₂, and the aldehydes were purified via the distillation of commercially available products. Indium salts, methylene compounds, and acid anhydrides were purchased and used without

Scheme 2. Possible Mechanism of an Indium-Catalyzed Knoevenagel Condensation

methylene (2; 0.66 mmol), and acetic anhydride (0.600 mmol, 61.3 mg) in succession. After the vial was sealed with a cap that contained a PTFE septum, the mixture was heated at 60 °C. The progress of the reaction was monitored by thin-layer chromatography (TLC) analysis, which was performed on silica gel 60 F_{254} . A saturated aqueous solution of NaHCO₃ was added to the resultant mixture, which was then extracted with EtOAc. The combined organic phase was dried over anhydrous Na₂SO₄, filtered, and then evaporated under reduced pressure. The crude material was purified by column chromatography (silica gel 60 F_{254} , 95:5 hexane/EtOAc) to give the corresponding Knoevenagel product **3** or **9** (followed by recrystallization, if necessary).

Dimethyl 2-Benzylidenemalonate (**3aa**). The general procedure was followed with benzaldehyde (**1a**; 63.7 mg, 0.600 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 8 h, with the exception of performing recrystallization from hexane following column chromatography, to yield a colorless solid (**3aa**; 113.6 mg, 86%): mp 40–41 °C; ¹H NMR (300.5 MHz, CDCl₃) δ 3.84 (s, 6 H, OCH₃), 7.38–7.43 (m, 5 H, ArH), 7.78 (s, 1 H, C=CH); ¹³C NMR (75.6 MHz, CDCl₃) δ 52.6, 125.4, 128.8, 129.3, 130.6, 132.7, 142.8, 164.4, 167.0; LRMS (FAB) *m/z* (% relative intensity) 221 ([M + H]⁺, 77), 189 (100). The spectroscopic data of **3aa** were in good agreement with that reported in the literature.¹⁶

Dimethyl 2-[4-(Dimethylamino)benzylidene]malonate (**3ba**). The general procedure was followed with 4-(dimethylamino)benzaldehyde (**1b**; 89.5 mg, 0.600 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 8 h to yield a yellow-green solid (**3ba**; 109.0 mg, 69%): mp 86–87 °C; ¹H NMR (300.5 MHz, CDCl₃) δ 3.00 (s, 6 H, N(CH₃)₂), 3.80 (s, 3 H, OCH₃), 3.88 (s, 3 H, OCH₃), 6.62 (d, J = 8.7 Hz, 2 H, ArH), 7.32 (d, J = 8.7 Hz, 2 H, ArH), 7.66 (s, 1 H, C=CH); ¹³C NMR (75.6 MHz, CDCl₃) δ 39.8, 52.1, 52.4, 111.4, 118.8, 119.7, 131.7, 143.4, 151.8, 165.3, 168.3; HRMS (FAB-Magnetic Sector) calcd for [M]⁺ (C₁₄H₁₇NO₄) m/z 263.1158, found 263.1166. The spectroscopic data of **3ba** were in good agreement with that reported in the literature.¹⁷

Dimethyl 2-(4-Methoxybenzylidene)malonate (**3***ca*). The general procedure was followed with 4-methoxybenzaldehyde (**1***c*; 81.7 mg, 0.600 mmol) and dimethyl malonate (**2***a*; 79.3 mg, 0.660 mmol) for 8 h to yield a colorless oil (**3***ca*; 99.1 mg, 66%): ¹H NMR (297.6 MHz, CDCl₃) δ 3.83 (*s*, 6 H, OCH₃), 3.87 (*s*, 3 H, OCH₃), 6.89 (d, *J* = 8.6 Hz, 2 H, ArH), 7.39 (d, *J* = 8.6 Hz, 2 H, ArH), 7.71 (*s*, 1 H, C=CH);

¹³C NMR (74.8 MHz, CDCl₃) δ 52.5, 52.6, 55.3, 114.3, 122.7, 125.2, 131.5, 142.6, 161.7, 164.8, 167.6; HRMS (EI-Quadrupole) calcd for $[M]^+$ (C₁₃H₁₄O₅) *m/z* 250.0841, found 250.0855. The spectroscopic data of **3ca** were in good agreement with that reported in the literature.¹⁷

Dimethyl 2-(3-Methoxybenzylidene)malonate (**3da**). The general procedure was followed with 3-methoxybenzaldehyde (**1d**; 81.7 mg, 0.600 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 8 h to yield a pale yellow solid (**3da**; 88.6 mg, 59%): mp 81–82 °C; ¹H NMR (500.2 MHz, CDCl₃) δ 3.80 (s, 3 H, OCH₃), 3.85 (s, 6 H, OCH₃), 6.94–7.00 (m, 2 H, ArH), 7.01 (d, *J* = 5.0 Hz, 1 H, ArH), 7.29 (t, *J* = 5.0 Hz, 1 H, ArH), 7.74 (s, 1 H, C=CH); ¹³C NMR (125.8 MHz, CDCl₃) δ 52.6, 52.7, 55.2, 114.2, 116.7, 121.9, 125.7, 129.9, 134.0, 142.7, 159.7, 164.4, 167.0; HRMS (EI-Quadrupole) calcd for [M]⁺ (C₁₃H₁₄O₅) *m*/z 250.0841, found 250.0849. The spectroscopic data of **3da** were in good agreement with that reported in the literature.¹⁷

Dimethyl 2-(2-Methoxybenzylidene)malonate (**3ea**). The general procedure was followed with 2-methoxybenzaldehyde (**1e**; 81.7 mg, 0.600 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 8 h, with the exception that recrystallization from hexane was performed after column chromatography, to yield a colorless solid (**3ea**; 106.6 mg, 71%): mp 53–54 °C; ¹H NMR (297.6 MHz, CDCl₃) δ 3.78 (s, 3 H, OCH₃), 3.84 (s, 3 H, OCH₃), 3.85 (s, 3 H, OCH₃), 6.92 (t, *J* = 5.0 Hz, 2 H, ArH), 7.32–7.39 (m, 2 H, ArH), 8.12 (s, 1 H, C=CH); ¹³C NMR (74.8 MHz, CDCl₃) δ 52.4, 55.4, 110.8, 120.5, 122.1, 125.2, 129.0, 132.1, 139.0, 158.0, 164.7, 167.1; HRMS (EI-Quadrupole) calcd for [M]⁺ (C₁₃H₁₄O₅) *m/z* 250.0841, found 250.0842. The spectroscopic data of **3ea** were in good agreement with that reported in the literature.¹⁷

Dimethyl 2-(4-Methylbenzylidene)malonate (**3fa**). The general procedure was followed with 4-methylbenzaldehyde (**1f**; 72.1 mg, 0.600 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 7 h to yield a colorless oil (**3fa**; 112.4 mg, 80%): ¹H NMR (500.2 MHz, CDCl₃) δ 2.37 (s, 3 H, CH₃), 3.84 (s, 3 H, OCH₃), 3.85 (s, 3 H, OCH₃), 7.18 (d, *J* = 8.0 Hz, 2 H, ArH), 7.32 (d, *J* = 8.0 Hz, 2 H, ArH), 7.74 (s, 1 H, C=CH); ¹³C NMR (125.8 MHz, CDCl₃) δ 21.4, 52.5, 52.6, 124.3, 129.5, 129.6, 129.9, 141.3, 142.9, 164.6, 167.3; HRMS (EI-Quadrupole) calcd for [M]⁺ (C₁₃H₁₄O₄) *m/z* 234.0892, found 234.0889. The spectroscopic data of **3fa** were in good agreement with that reported in the literature.¹⁸

Dimethyl 2-(4-Phenylbenzylidene)malonate (**3ga**). The general procedure was followed with 4-phenylbenzaldehyde (**1g**; 109.3 mg, 0.6000 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 5 h to yield a colorless solid (**3ga**; 149.3 mg, 84%): mp 75–76 °C; ¹H NMR (297.6 MHz, CDCl₃) δ 3.86 (s, 3 H, OCH₃), 3.88 (s, 3 H, OCH₃), 7.37 (t, *J* = 8.9 Hz, 1 H, ArH), 7.45 (t, *J* = 8.9 Hz, 2 H, ArH), 7.50 (d, *J* = 8.9 Hz, 2 H, ArH), 7.59 (d, *J* = 8.9 Hz, 2 H, ArH), 7.51 (s, 1 H, C=CH); ¹³C NMR (74.8 MHz, CDCl₃) δ 52.6, 52.7, 125.1, 127.0, 127.5, 128.0, 128.9, 130.0, 131.5, 139.8, 142.4, 143.4, 164.5, 167.2; IR (neat) 1731 s, 1632 w, 1434 w, 1270 m, 1223 m, 1196 m, 1070 w, 765 w cm⁻¹; HRMS (EI-Quadrupole) calcd for [M]⁺ (C₁₈H₁₆O₄) *m/z* 296.1049, found 296.1039.

Dimethyl 2-(4-Fluorobenzylidene)malonate (**3ha**). The general procedure was followed with 4-fluorobenzaldehyde (**1h**; 74.5 mg, 0.600 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 8 h, with the exception that recrystallization from hexane was performed after column chromatography, to yield a colorless solid (**3ha**; 124.3 mg, 87%): mp 38–39 °C; ¹H NMR (297.6 MHz, CDCl₃) δ 3.85 (s, 6 H, OCH₃), 7.08 (t, *J* = 8.3 Hz, 2 H, ArH), 7.42 (d, *J* = 8.3 Hz, 1 H, ArH), 7.45 (d, *J* = 8.3 Hz, 1 H, ArH), 7.73 (s, 1 H, C==CH); ¹³C NMR (74.8 MHz, CDCl₃) δ 52.6, 52.7, 116.0 (d, *J* = 22.4 Hz), 125.2, 128.9 (d, *J* = 3.7 Hz), 131.5 (d, *J* = 9.0 Hz), 141.5, 163.9 (d, *J* = 252.8 Hz), 164.3, 166.9; HRMS (EI-Quadrupole) calcd for [M]⁺ (C₁₂H₁₁FO₄) *m*/*z* 238.0641, found 238.0638. The spectroscopic data of **3ha** were in good agreement with that reported in the literature.¹⁷

Dimethyl 2-(4-Chlorobenzylidene)malonate (**3ia**). The general procedure was followed with 4-chlorobenzaldehyde (**1i**; 84.3 mg, 0.600 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 8 h, with the exception that recrystallization from hexane was performed after column chromatography, to yield a colorless solid (**3ia**; 143.6 mg, 94%): mp 36–37 °C; ¹H NMR (500.2 MHz, CDCl₃) δ 3.85 (s, 6 H,

OCH₃), 7.36 (s, 4 H, ArH), 7.72 (s, 1 H, C=CH); ¹³C NMR (125.8 MHz, CDCl₃) δ 52.7, 125.9, 129.1, 130.5, 131.2, 136.7, 141.4, 164.2, 166.8; HRMS (EI-Quadrupole) calcd for $[M]^+$ (C₁₂H₁₁ClO₄) m/z 254.0346, found 254.0344. The spectroscopic data of **3ia** were in good agreement with that reported in the literature.¹⁷

Dimethyl 2-(3-Chlorobenzylidene)malonate (**3***ja*). The general procedure was followed with 4-chlorobenzaldehyde (**1***j*; 84.3 mg, 0.600 mmol) and dimethyl malonate (**2***a*; 79.3 mg, 0.660 mmol) for 8 h to yield a colorless solid (**3***ja*; 132.9 mg, 87%): mp 65–66 °C; ¹H NMR (500.2 MHz, CDCl₃) δ 3.86 (s, 6 H, OCH₃), 7.29–7.34 (m, 2 H, ArH), 7.37–7.40 (m, 2 H, ArH), 7.70 (s, 1 H, C=CH); ¹³C NMR (125.8 MHz, CDCl₃) δ 52.7, 52.8, 126.9, 127.3, 129.1, 130.1, 130.5, 134.5, 134.8, 141.1, 164.0, 166.5; IR (neat) 1724 s, 1624 w, 1433 m, 1373 w, 1258 m, 1200 s, 1068 w, 783 w cm⁻¹; HRMS (EI-Quadrupole) calcd for [M]⁺ (C₁₂H₁₁ClO₄) *m/z* 254.0346, found 254.0328.

Dimethyl 2-(2-Chlorobenzylidene)malonate (**3ka**). The general procedure was followed with 4-chlorobenzaldehyde (**1k**; 84.3 mg, 0.600 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 8 h to yield a colorless oil (**3ka**; 145.2 mg, 95%): ¹H NMR (500.2 MHz, CDCl₃) δ 3.75 (s, 3 H, OCH₃), 3.87 (s, 3 H, OCH₃), 7.25 (t, *J* = 10.0 Hz, 1 H, ArH), 7.33 (t, *J* = 10.0 Hz, 1 H, ArH), 7.40 (d, *J* = 10.0 Hz, 1 H, ArH), 7.44 (d, *J* = 10.0 Hz, 1 H, ArH), 8.07 (s, 1 H, C=CH); ¹³C NMR (125.8 MHz, CDCl₃) δ 52.5, 52.7, 126.9, 127.9, 129.0, 129.9, 131.3, 131.8, 134.7, 139.9, 164.0, 166.2; HRMS (EI-Quadrupole) calcd for [M]⁺ (C₁₂H₁₁ClO₄) *m/z* 254.0346, found 254.0330. The spectroscopic data of **3ka** were in good agreement with that reported in the literature.¹⁷

Dimethyl 2-(4-Bromobenzylidene)malonate (**3***la*). The general procedure was followed with 4-bromobenzaldehyde (**1***l*; 111 mg, 0.600 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 5 h to yield a colorless oil (**3***la*; 154.3 mg, 86%): ¹H NMR (297.6 MHz, CDCl₃) δ 3.84 (s, 3 H, OCH₃), 3.85 (s, 3 H, OCH₃), 7.28 (d, J = 8.3 Hz, 2 H, ArH), 7.51 (d, J = 8.3 Hz, 2 H, ArH), 7.70 (s, 1 H, C=CH); ¹³C NMR (74.8 MHz, CDCl₃) δ 52.7, 125.2, 126.1, 130.7, 131.6, 132.1, 141.5, 164.2, 166.8; IR (neat) 1729 s, 1630 w, 1489 w, 1437 m, 1261 s, 1221 s, 1069 m cm⁻¹; HRMS (EI-Quadrupole) calcd for [M]⁺ (C₁₂H₁₁BrO₄) *m/z* 297.9841, found 297.9862.

Dimethyl 2-[4-(Methoxycarbonyl)benzylidene]malonate (**3ma**). The general procedure was followed with 4-(methoxycarbonyl)benzaldehyde (**1m**; 98.5 mg, 0.600 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 8 h, with the exception that recrystallization from hexane was performed after column chromatography, to yield a colorless solid (**3ma**; 163.6 mg, 98%): mp 114–115 °C; ¹H NMR (500.2 MHz, CDCl₃) δ 3.84 (s, 3 H, OCH₃), 3.87 (s, 3 H, OCH₃), 3.93 (s, 3 H, OCH₃), 7.48 (d, *J* = 8.0 Hz, 2 H, ArH), 7.80 (s, 1 H, C=CH), 8.04 (d, *J* = 8.0 Hz, 2 H, ArH); ¹³C NMR (125.8 MHz, CDCl₃) δ 52.3, 52.7, 52.8, 127.5, 129.0, 129.9, 131.5, 137.0, 141.4, 164.0, 166.1, 166.5; HRMS (EI-Quadrupole) calcd for [M]⁺ (C₁₄H₁₄O₆) *m*/z 278.0790, found 278.0798. The spectroscopic data of **3ma** were in good agreement with that reported in the literature.¹⁷

Dimethyl 2-[4-(Trifluoromethyl)benzylidene]malonate (**3na**). The general procedure was followed with 4-(trifluoromethyl)benzaldehyde (**1n**; 104.5 mg, 0.6000 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 8 h to yield a colorless solid (**3na**; 152.2 mg, 88%): mp 43-44 °C; ¹H NMR (500.2 MHz, CDCl₃) δ 3.85 (s, 3 H, OCH₃), 3.87 (s, 3 H, OCH₃), 7.53 (d, *J* = 8.0 Hz, 2 H, ArH), 7.65 (d, *J* = 8.0 Hz, 2 H, ArH), 7.79 (s, 1 H, C=CH); ¹³C NMR (125.8 MHz, CDCl₃) δ 52.8, 52.9, 123.6 (q, *J* = 272.5 Hz), 125.8 (q, *J* = 3.9 Hz), 127.9, 129.4, 132.0 (q, *J* = 32.6 Hz), 136.2, 141.0, 164.0, 166.4; IR (neat) 1732 s, 1724 s, 1721 s, 1635 w, 1439 w, 1326 s, 1265 s, 1226 m, 1166 m, 1117 s, 1067 s, 849 w cm⁻¹; HRMS (EI-Quadrupole) calcd for [M]⁺ (C₁₃H₁₁F₃O₄) *m/z* 288.0609, found 288.0604.

Dimethyl 2-[3-(Trifluoromethyl)benzylidene]malonate (**30a**). The general procedure was followed with 3-(trifluoromethyl)benzaldehyde (**10**; 104.5 mg, 0.6000 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 8 h to yield a colorless solid (**30a**; 138.3 mg, 80%): mp 52–53 °C; ¹H NMR (500.2 MHz, CDCl₃) δ 3.85 (s, 3 H, OCH₃), 3.87 (s, 6 H, OCH₃), 7.53 (t, *J* = 10.0 Hz, 1 H, ArH), 7.60 (d, *J* = 10.0 Hz, 1 H, ArH), 7.66 (d, *J* = 10.0 Hz, 1 H, ArH), 7.68 (s, 1 H, ArH),

7.79 (s, 1 H, C=CH); ¹³C NMR (125.8 MHz, CDCl₃) δ 52.7, 52.8, 123.6 (q, *J* = 272.5 Hz), 125.7 (q, *J* = 3.9 Hz), 126.9 (q, *J* = 3.9 Hz), 127.4, 129.4, 131.3 (q, *J* = 32.6 Hz), 132.3, 133.5, 140.9, 164.0, 166.4; IR (neat) 1728 s, 1635 w, 1439 w, 1366 w, 1336 m, 1253 m, 1227 m, 1196 m, 1159 w, 1117 s, 1071 m, 809 w, 698 w cm⁻¹; HRMS (EI-Quadrupole) calcd for [M]⁺ (C₁₃H₁₁F₃O₄) *m/z* 288.0609, found 288.0597.

Dimethyl 2-[2-(Trifluoromethyl)benzylidene]malonate (3pa). The general procedure was followed with 2-(trifluoromethyl)benzaldehyde (1p; 104.5 mg, 0.6000 mmol) and dimethyl malonate (2a; 79.3 mg, 0.660 mmol) for 8 h to yield a colorless oil (3pa; 159.1 mg, 92%): ¹H NMR (500.2 MHz, CDCl₃) δ 3.67 (s, 3 H, OCH₃), 3.88 (s, 3 H, OCH₃), 7.44 (d, *J* = 7.5 Hz, 1 H, ArH), 7.50 (t, *J* = 7.5 Hz, 1 H, ArH), 7.54 (t, *J* = 7.5 Hz, 1 H, ArH), 7.72 (d, *J* = 7.5 Hz, 1 H, ArH), 8.10 (s, 1 H, C=CH); ¹³C NMR (125.8 MHz, CDCl₃) δ 52.5, 52.8, 123.7 (q, *J* = 273.4 Hz), 126.1 (q, *J* = 5.8 Hz), 128.7 (q, *J* = 30.7 Hz), 129.1, 129.5, 129.6, 131.8, 132.1 (q, *J* = 1.9 Hz), 140.2, 163.7, 165.8; IR (neat) 1733 s, 1438 m, 1316 s, 1306 m, 1296 m, 1263 s, 1225 m, 1168 s, 1123 s, 1067 s, 1036 m, 771 m cm⁻¹; HRMS (EI-Quadrupole) calcd for [M]⁺ (C₁₃H₁₁F₃O₄) *m/z* 288.0609, found 288.0617.

Dimethyl 2-(4-Cyanobenzylidene)malonate (**3qa**). The general procedure was followed with 4-cyanobenzaldehyde (**1q**; 78.7 mg, 0.600 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 8 h to yield a colorless solid (**3qa**; 135.4 mg, 92%): mp 97–98 °C; ¹H NMR (300.5 MHz, CDCl₃) δ 3.85 (s, 3 H, OCH₃), 3.88 (s, 3 H, OCH₃), 7.53 (d, J = 8.1 Hz, 2 H, ArH), 7.69 (d, J = 8.1 Hz, 2 H, ArH), 7.76 (s, 1 H, C=CH); ¹³C NMR (75.6 MHz, CDCl₃) δ 52.8, 113.6, 117.9, 128.5, 129.4, 132.4, 137.0, 140.2, 163.6, 166.0; HRMS (EI-Quadrupole) calcd for [M]⁺ (C₁₃H₁₁NO₄) m/z 245.0688, found 245.0716. The spectroscopic data of **3qa** were in good agreement with that reported in the literature.¹⁸

Dimethyl 2-(4-Nitrobenzylidene)malonate (**3ra**). The general procedure was followed with 4-nitrobenzaldehyde (**1r**; 90.7 mg, 0.600 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 8 h to yield a pale yellow solid (**3ra**; 146.4 mg, 92%): mp 135–136 °C; ¹H NMR (500.2 MHz, CDCl₃) δ 3.86 (s, 3 H, OCH₃), 3.89 (s, 3 H, OCH₃), 7.59 (d, *J* = 9.0 Hz, 2 H, ArH), 7.81 (s, 1 H, C=CH), 8.24 (d, *J* = 9.0 Hz, 2 H, ArH); ¹³C NMR (125.8 MHz, CDCl₃) δ 52.9, 123.9, 129.1, 129.8, 139.0, 139.8, 148.4, 163.6, 165.9; HRMS (EI-Quadrupole) calcd for [M]⁺ (C₁₂H₁₁NO₆) *m*/z 265.0586, found 265.0572. The spectroscopic data of **3ra** were in good agreement with that reported in the literature.¹⁸

Dimethyl 2-(2-Acetoxybenzylidene)malonate (5). The general procedure was followed with 4-hydroxybenzaldehyde (1s; 73.3 mg, 0.600 mmol) and dimethyl malonate (2a; 79.3 mg, 0.660 mmol) for 8 h to yield a colorless oil (5; 66.8 mg, 40%): ¹H NMR (300.5 MHz, CDCl₃) δ 2.33 (s, 3 H, CH₃), 3.76 (s, 3 H, OCH₃), 3.85 (s, 3 H, OCH₃), 7.15 (d, *J* = 7.8 Hz, 1 H, ArH), 7.23 (t, *J* = 7.8 Hz, 1 H, ArH), 7.42 (t, *J* = 7.8 Hz, 2 H, ArH), 7.83(s, 1 H, C=CH); ¹³C NMR (75.6 MHz, CDCl₃) δ 20.8, 52.5, 52.7, 122.8, 126.06, 126.09, 127.6, 128.8, 131.4, 137.7, 149.0, 164.1, 166.3, 168.8; IR (neat) 1768 m, 1730 s, 1632 w, 1437 m, 1370 m, 1261 s, 1176 s, 1103 m, 1067 m, 910 w, 763 w cm⁻¹; HRMS (FAB-Magnetic Sector) calcd for [M + H]⁺ (C₁₄H₁₅O₆) m/z 279.0869, found 279.0872.

3-(Methoxycarbonyl)coumarin (6). The general procedure was followed with 4-hydroxybenzaldehyde (1s; 73.3 mg, 0.600 mmol) and dimethyl malonate (2a; 79.3 mg, 0.660 mmol) for 8 h to yield a colorless solid (6; 8.6 mg, 7%): mp 115–116 °C; ¹H NMR (500.2 MHz, CDCl₃) δ 3.96 (s, 3 H, OCH₃), 7.35 (t, *J* = 7.5 Hz, 1 H, ArH), 7.37 (d, *J* = 7.5 Hz, 1 H, ArH), 7.63 (d, *J* = 7.5 Hz, 1 H, ArH), 7.67 (t, *J* = 7.5 Hz, 1 H, ArH), 8.58 (s, 1 H, C=CH); ¹³C NMR (125.8 MHz, CDCl₃) δ 52.9, 116.7, 117.8, 117.9, 124.9, 129.5, 134.4, 149.1, 155.2, 156.7, 163.7; HRMS (EI-Quadrupole) calcd for [M]⁺ (C₁₁H₈O₄) *m/z* 204.0423, found 204.0404. The spectroscopic data of **6** were in good agreement with that reported in the literature.¹⁹

Methyl 2-Benzylidene-3-oxobutanoate (3ab). The general procedure was followed with benzaldehyde (1a; 63.7 mg, 0.600 mmol) and methyl acetoacetate (2b; 76.6 mg, 0.660 mmol) for 8 h to yield a pale yellow oil ((*Z*)-3ab; 56.4 mg, 46%): ¹H NMR (500.2 MHz, CDCl₃) δ 2.42 (s, 3 H, CH₃), 3.84 (s, 3 H, OCH₃), 7.39–7.44 (m, 5 H, ArH), 7.58 (s, 1 H, C=CH); ¹³C NMR (125.8 MHz, CDCl₃)

δ 26.4, 52.5, 128.9, 129.4, 130.8, 132.8, 134.2, 141.6, 168.2, 194.6; LRMS (FAB) m/z (% relative intensity) 205 ([M + H]⁺, 49%), 173 (100), 131 (52), 73 (54). The spectroscopic data of (*Z*)-**3ab** were in good agreement with that reported in the literature.²⁰

Also generated was a pale yellow-green oil ((*E*)-**3ab**; 40.4 mg, 33%): ¹H NMR (500.2 MHz, CDCl₃) δ 2.35 (s, 3 H, CH₃), 3.84 (s, 3 H, OCH₃), 7.39 (s, 5 H, ArH), 7.70 (s, 1 H, C=CH); ¹³C NMR (125.8 MHz, CDCl₃) δ 31.2, 52.5, 128.9, 129.6, 130.5, 132.8, 133.6, 140.8, 164.9, 203.4; LRMS (FAB) *m/z* (% relative intensity) 205 ([M + H]⁺, 100), 173 (35), 147 (25), 73 (38). The spectroscopic data of (*E*)-**3ab** were in good agreement with that reported in the literature.²⁰

Ethyl 2-Benzoyl-3-phenyl Acrylate (**3ac**). The general procedure was followed with benzaldehyde (**1a**; 63.7 mg, 0.600 mmol) and ethyl benzoylacetate (**2c**; 126.9 mg, 0.6600 mmol) for 8 h to yield a colorless solid (**3ac**; 141.3 mg, 84%, *E*:*Z* = 10:90): mp 94–95 °C; ¹H NMR (297.6 MHz, CDCl₃, *Z* isomer) δ 1.17 (t, 3 H, CH₃), 4.21 (q, 2 H, OCH₂), 7.20–7.27 (m, 3 H, ArH), 7.35 (d, *J* = 7.4 Hz, 2 H, ArH), 7.42 (t, *J* = 7.4 Hz, 2 H, ArH), 7.55 (t, *J* = 7.4 Hz, 1 H, ArH), 7.94–7.97 (m, 3 H, C=CH, ArH); ¹³C NMR (74.8 MHz, CDCl₃ *Z* isomer) δ 13.9, 61.5, 128.7, 128.8, 129.0, 130.1, 130.3, 131.2, 132.7, 133.8, 136.0, 142.5, 164.9, 195.6; LRMS (EI) *m*/*z* (% relative intensity) 280 (M⁺, 100), 251 (18), 235 (20), 178 (42), 105 (100). The spectroscopic data of **3ac** were in good agreement with that reported in the literature.²¹

2-Benzylidene-N,N-dimethyl-3-oxobutanamide (**3ad**). The general procedure was followed with benzaldehyde (**1a**; 63.7 mg, 0.600 mmol) and N,N-dimethylacetoacetamide (**2d**; 85.2 mg, 0.660 mmol) for 30 h to yield a pale yellow-green oil (**3ad**; 22.2 mg, 17%): ¹H NMR (500.2 MHz, CDCl₃) δ 2.44 (s, 3 H, CH₃), 2.77 (s, 3 H, NCH₃), 3.09 (s, 3 H, NCH₃), 7.39–7.40 (m, 3 H, ArH), 7.48–7.50 (m, 2 H, ArH), 7.51 (s, 1 H, C=CH); ¹³C NMR (125.8 MHz, CDCl₃) δ 26.5, 34.5, 37.4, 129.0, 129.6, 130.6, 133.1, 136.1, 139.3, 168.4, 195.7; IR (neat) 1662 m, 1620 s, 1497 w, 1407 w, 1242 w, 1210 w, 1155 w, 763 w cm⁻¹; LRMS (FAB) *m/z* (% relative intensity) 218 ([M + H]⁺, 100), 173 (59), 131 (36), 73 (22).

2-Benzylidenemalonic Acid (**3ae**). The general procedure was followed with benzaldehyde (**1a**; 63.7 mg, 0.600 mmol) and malonic acid (**2e**; 68.7 mg, 0.660 mmol) for 8 h, with the exception of using H₂O instead of aq. NaHCO₃ for the reaction workup, which was followed by isolation via recrystallization from CHCl₃ to yield a colorless solid (**3ae**; 89.9 mg, 78%): mp 193–194 °C; ¹H NMR (297.6 MHz, DMSO-*d*₆) δ 7.43 (t, *J* = 8.0 Hz, 3 H, ArH), 7.54 (s, 1 H, C=CH), 7.56 (d, *J* = 3.3 Hz, 1 H, ArH), 7.58 (d, *J* = 3.3 Hz, 1 H, ArH), 13.2 (s, 2 H, COOH); ¹³C NMR (74.8 MHz, DMSO-*d*₆) δ 128.5, 129.0, 129.3, 130.5, 132.9, 138.7, 165.3, 168.1; HRMS (FAB-Magnetic Sector) calcd for [M + H]⁺ (C₁₀H₉O₄) *m/z* 193.0501, found 193.0504. The spectroscopic data of **3ae** were in good agreement with that reported in the literature.¹⁷

2-Benzylidenemalononitrile (**3af**). The general procedure was followed with benzaldehyde (**1a**; 63.7 mg, 0.600 mmol) and malononitrile (**2f**; 39.6 mg, 0.660 mmol) for 8 h, with the exception of using DMF instead of toluene, to yield a colorless solid (**3af**; 79.6 mg, 86%): mp 83–84 °C; ¹H NMR (500.2 MHz, CDCl₃) δ 7.55 (t, *J* = 7.5 Hz, 2 H, ArH), 7.64 (t, *J* = 7.5 Hz, 1 H, ArH), 7.79 (s, 1 H, C=CH), 7.91 (d, *J* = 7.5 Hz, 2 H, ArH); ¹³C NMR (125.8 MHz, CDCl₃) δ 82.6, 112.5, 113.6, 129.5, 130.6, 130.8, 134.5, 159.9; HRMS (FAB-Magnetic Sector) calcd for [M + H]⁺ (C₁₀H₉O₄) *m/z* 193.0501, found 193.0504. The spectroscopic data of **3af** were in good agreement with that reported in the literature.^{3e}

3,3,6,6-Tetramethyl-9-phenyl-3,4,5,6,7,9-hexahydro-1H-xanthene-1,8(2H)-dione (7). The general procedure was followed with benzaldehyde (1a; 63.7 mg, 0.600 mmol) and 5,5-dimethyl-1,3cyclohexanedione (2g; 92.5 mg, 0.660 mmol) for 8 h to yield a colorless solid (7; 113.5 mg, 54%): mp 203–205 °C; ¹H NMR (297.6 MHz, CDCl₃) δ 0.98 (s, 6 H, CH₃), 1.09 (s, 6 H, CH₃), 2.15 (d, *J* = 16.1 Hz, 2 H, CH₂), 2.23 (d, *J* = 16.1 Hz, 2 H, CH₂), 2.47 (s, 4 H, CH₂), 4.75 (s, 1 H, CH), 7.08 (t, *J* = 7.7 Hz, 1 H, ArH), 7.20 (t, *J* = 7.7 Hz, 2 H, ArH), 7.29 (d, *J* = 7.7 Hz, 2 H, ArH); ¹³C NMR (74.8 MHz, CDCl₃) δ 27.2, 29.1, 31.7, 32.1, 40.7, 50.6, 115.5, 126.2, 127.9, 128.2, 144.0, 162.2, 196.3; LRMS (FAB) *m*/*z* (% relative intensity) 351 ($[M + H]^+$, 95), 350 (M^+ , 40), 273 (100). The spectroscopic data of 7 were in good agreement with that reported in the literature.²²

Dimethyl 4-Pyridylmethylenemalonate (9aa). The general procedure was followed with 4-formylpyridine (8a; 64.3 mg, 0.600 mmol) and dimethyl malonate (2a; 79.3 mg, 0.660 mmol) for 15 h to yield a pale brown solid (9aa; 86.3 mg, 65%): mp 72–73 °C; ¹H NMR (500.2 MHz, DMSO- d_6) δ 3.79 (s, 3 H, OCH₃), 3.80 (s, 3 H, OCH₃), 7.38 (d, *J* = 6.0 Hz, 2 H, ArH), 7.78 (s, 1 H, C=CH) 8.66 (d, *J* = 6.0 Hz, 2 H, ArH); ¹³C NMR (125.8 MHz, DMSO- d_6) δ 52.96, 53.03, 122.7, 129.0, 139.6, 139.8, 150.5, 163.3, 165.5; IR (neat) 1722 s, 1597 w, 1441 w, 1266 m, 1221 m, 1068 w, 811 w cm⁻¹; HRMS (FAB-Magnetic Sector) calcd for [M + H]⁺ (C₁₁H₁₂NO₄) *m/z* 222.0766, found 222.0796.

Dimethyl 2-(6-Bromo)pyridylmethylenemalonate (**9ba**). The general procedure was followed with 2-bromo-6-formylpyridine (**8b**; 111.6 mg, 0.6000 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 13 h to yield a pale brown solid (**9ba**; 149.5 mg, 83%): mp 105–106 °C; ¹H NMR (500.2 MHz, CDCl₃) δ 3.87 (s, 3 H, OCH₃), 4.00 (s, 3 H, OCH₃), 7.34 (d, *J* = 5.0 Hz, 1 H, ArH), 7.45 (d, *J* = 5.0 Hz, 1 H, ArH), 7.55 (s, 1 H, C==CH), 7.58 (t, *J* = 5.0 Hz, 1 H, ArH); ¹³C NMR (125.8 MHz, CDCl₃) δ 52.7, 52.9, 125.0, 129.1, 129.6, 137.5, 139.0, 141.9, 151.7, 164.0, 166.3; IR (neat) 1726 s, 1637 w, 1438 w, 1411 w, 1376 w, 1274 m, 1248 m, 1218 m, 1207 m, 1163 w, 1063 w, 788 w cm⁻¹; HRMS (EI-Quadrupole) calcd for [M]⁺ (C₁₁H₁₀BrNO₄) *m/z* 298.9793, found 298.9789.

Dimethyl 2-(Thien-2-ylmethylene)malonate (**9ca**). The general procedure was followed with 2-formylthiophene (**8c**; 67.3 mg, 0.600 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 8 h, with the exception of performing recrystallization from hexane following column chromatography, to yield a colorless solid (**9ca**; 86.9 mg, 64%): mp 43–44 °C; ¹H NMR (297.6 MHz, CDCl₃) δ 3.84 (s, 3 H, OCH₃), 3.94 (s, 3 H, OCH₃), 7.09 (dd, *J* = 4.5, 4.8 Hz, 1 H, ArH), 7.37 (d, *J* = 4.5 Hz, 1 H, ArH), 7.54 (d, *J* = 4.8 Hz, 1 H, ArH), 7.90 (s, 1 H, C=CH); ¹³C NMR (74.8 MHz, CDCl₃) δ 52.6, 52.8, 121.5, 127.8, 131.9, 134.7, 135.5, 135.9, 164.7, 166.6; HRMS (EI-Quadrupole) calcd for [M]⁺ (C₁₀H₁₀O₄S) *m/z* 226.0300, found 226.0300. The spectroscopic data of **9ca** were in good agreement with that reported in the literature.²³

(E)-Dimethyl 2-(3-Phenylallylidene)malonate (**9da**). The general procedure was followed with (*E*)-cinnamaldehyde (**8d**; 79.3 mg, 0.600 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 8 h to yield a yellow solid (**9da**; 116.7 mg, 79%): mp 64–65 °C; ¹H NMR (500.2 MHz, CDCl₃) δ 3.81 (s, 3 H, OCH₃), 3.90 (s, 3 H, OCH₃), 7.04 (d, *J* = 16.0 Hz, 1 H, PhCH), 7.27 (dd, *J* = 15.0, 15.5 Hz, 1 H, PhCH=CH), 7.32–7.38 (m, 3 H, ArH), 7.50 (d, *J* = 6.0 Hz, 2 H, ArH), 7.56 (d, *J* = 11.5 Hz, 1 H, PhCH=CH–CH=C); ¹³C NMR (125.8 MHz, CDCl₃) δ 52.2, 52.3, 123.1, 123.9, 127.8, 128.8, 129.8, 135.4, 145.1, 146.1, 165.0, 165.6; HRMS (EI-Quadrupole) calcd for [M]⁺ (C₁₄H₁₄O₄) *m/z* 246.0892, found 246.0881. The spectroscopic data of **9da** were in good agreement with that reported in the literature.²⁴

Dimethyl 2-(3-Phenylpropylidene)malonate (**9ea**). The general procedure was followed with 3-phenylpropanal (**8e**; 80.5 mg, 0.600 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 24 h to yield a colorless oil (**9ea**; 89.4 mg, 60%): ¹H NMR (300.5 MHz, CDCl₃) δ 2.63 (q, *J* = 7.9 Hz, 2 H, CH₂CH₂CH), 2.80 (t, *J* = 7.2 Hz, 2 H, PhCH₂), 3.78 (s, 3 H, OCH₃), 3.80 (s, 3 H, OCH₃), 7.07 (t, *J* = 7.5 Hz, 1 H, C=CH), 7.17–7.19 (m, 3 H, ArH), 7.26–7.30 (m, 2 H, ArH); ¹³C NMR (74.8 MHz, CDCl₃) δ 31.5, 34.3, 52.2, 52.3, 126.3, 128.29, 128.32, 128.5, 140.2, 149.2, 164.3, 165.7. The spectroscopic data of **9ea** were in good agreement with that reported in the literature.²⁵

Dimethyl 2-Hexylidenemalonate (**9fa**). The general procedure was followed with hexanal (**8f**; 60.1 mg, 0.600 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 24 h to yield a colorless oil (**9fa**; 90.0 mg, 70%): ¹H NMR (500.2 MHz, CDCl₃) δ 0.89 (t, J = 6.6 Hz, 3 H, CH₃), 1.28–1.33 (m, 4 H, CH₃CH₂CH₂CH₂CH₂), 1.44–1.54 (m, 2 H, CH₃CH₂), 2.30 (q, J = 7.4 Hz, 2 H, CHCH₂), 3.78 (s, 3 H, OCH₃), 3.82 (s, 3 H, OCH₃), 7.04 (t, J = 7.7 Hz, 1 H, C=CH); ¹³C NMR (74.8 MHz, CDCl₃) δ 13.9, 22.3, 27.9, 29.8, 31.3, 52.2, 52.3, 127.8, 150.6, 164.4, 166.0; IR (neat) 2956 m, 2862 w, 1729 s, 1646 w, 1437 m, 1370 w, 1259 m, 1225 m, 1144 w, 1062 m cm⁻¹; HRMS

(EI-Quadrupole) calcd for $[M]^+$ ($C_{11}H_{18}O_4$) m/z 214.1205, found 214.1208.

Dimethyl 2-(2-Phenylpropylidene)malonate (**9ga**). The general procedure was followed with 2-phenylpropionaldehyde (**8g**; 80.5 mg, 0.600 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 24 h to yield a colorless oil (**9ga**; 116 mg, 71%): ¹H NMR (500.2 MHz, CDCl₃) δ 1.45 (d, *J* = 6.9 Hz, 3 H, CH₃), 3.76 (s, 3 H, OCH₃), 3.86 (s, 3 H, OCH₃), 3.88–3.92 (m, 1 H, ArCH), 7.04 (d, *J* = 10.8 Hz, 1 H, C=CH), 7.24 (d, *J* = 8.0 Hz, 3 H, ArH), 7.32 (t, *J* = 7.7 Hz, 2 H, ArH); ¹³C NMR (125.8 MHz, CDCl₃) δ 20.2, 39.6, 52.3, 52.4, 126.0, 127.0, 127.1, 128.8, 142.2, 152.8, 164.4, 165.8. The spectroscopic data of **9ga** were in good agreement with that reported in the literature.²⁶

Dimethyl 2-72-Methylpropylidene)malonate (**9ha**). The general procedure was followed with isobutyraldehyde (**8h**; 43.3 mg, 0.600 mmol) and dimethyl malonate (**2a**; 158.5 mg, 1.200 mmol) for 24 h to yield a colorless oil (**9ha**; 79 mg, 71%): ¹H NMR (297.6 MHz, CDCl₃) δ 1.06 (d, J = 6.5 Hz, 6 H, CH₃), 2.62–2.75 (m, 1 H, CH₃CHCH₃), 3.78 (s, 3 H, OCH₃), 3.83 (s, 3 H, OCH₃), 6.81 (d, J = 10.7 Hz, 1 H, C=CH); ¹³C NMR (125.8 MHz, CDCl₃) δ 21.8, 29.5, 52.2, 52.3, 125.7, 155.9, 164.5, 166.0. The spectroscopic data of **9ha** were in good agreement with that reported in the literature.²⁷

Dimethyl 2-(Cyclohexylmethylene)malonate (**9ia**). The general procedure was followed with cyclohexanecarboxaldehyde (**8i**; 67.3 mg, 0.600 mmol) and dimethyl malonate (**2a**; 79.3 mg, 0.660 mmol) for 24 h to yield a colorless oil (**9ia**; 97.7 mg, 72%): ¹H NMR (297.6 MHz, CDCl₃) δ 1.11–1.35 (m, SH, CyH), 1.70–1.73 (m, SH, CyH), 2.33–2.45 (m, 1 H, CH₂CHCH₂), 3.78 (s, 3 H, OCH₃), 3.84 (s, 3 H, OCH₃), 6.84 (d, *J* = 10.4 Hz, 1 H, C=CH); ¹³C NMR (74.8 MHz, CDCl₃) δ 25.1, 25.6, 31.6, 39.1, 52.2, 52.3, 126.0, 154.6, 164.6, 166.1. The spectroscopic data of **9ia** were in good agreement with that reported in the literature.²⁵

Dimethyl 2-(2,2-Dimethylpropylidene)malonate (**9***j***a**). The general procedure was followed with pivalaldehyde (**8***j*; 51.7 mg, 0.600 mmol) and dimethyl malonate (**2a**; 158.5 mg, 1.200 mmol) for 24 h to yield a colorless oil (**9***j***a**; 81.7 mg, 68%): ¹H NMR (297.6 MHz, CDCl₃) δ 1.14 (s, 9 H, CH₃), 3.77 (s, 3 H, OCH₃), 3.82 (s, 3 H, OCH₃), 6.92 (s, 1 H, C=CH); ¹³C NMR (74.8 MHz, CDCl₃) δ 28.7, 34.2, 52.2, 52.4, 124.5, 155.8, 164.8, 167.3; IR (neat) 2959 m, 1734 s, 1642 w, 1436 m, 1368 w, 1251 s, 1232 s, 1197 m, 1070 m, 1002 w cm⁻¹; HRMS (EI-Quadrupole) calcd for $[M-CH_3]^+$ (C₉H₁₃O₄) *m/z* 185.0814, found 185.0814.

(8) When the reaction of 1a with 2a in the presence of a catalytic amount of $InBr_3$ in toluene was conducted at 60 °C for 8 h using various additives, such as TMSCl, Tf_2O , and $(CF_3CO)_2O$, the corresponding Knoevenagel adduct 3aa was obtained in 30, 0, and 27% yield, respectively.

(9) The yields of **3aa** and **4a** under the conditions in entry 6 of Table 1 are listed as follows: 95 and 0% in CH_3Cl , 68 and 6% in CH_3CN_3 , 4 and 32% in THF, respectively, and 0% each in MeOH. Although CH_3Cl was a slightly better solvent than toluene (94 and 4%), we chose toluene as the best solvent due to its good mass balance.

(10) The *E*:*Z* geometries of the products **3ab** and **3ac** were assigned on the basis of NOESY analyses.

(11) A sole geometric isomer of **3ad** was obtained; unfortunately, the geometry (E or Z) was not able to be determined.

(14) Indium-catalyzed synthesis of germinal diacetate from aldehydes with Ac₂O has been reported: (a) Yadav, J. S.; Reddy, B. V. S.; Srinivas, C. Synth. Commun. **2002**, 32, 1175–1180. (b) Yadav, J. S.; Reddy, B. V. S.; Srinivas, C. Synth. Commun. **2002**, 32, 2169–2174. (c) Yin, L.; Zhang, Z.-H.; Wang, Y.-M.; Pang, M.-L. Synlett **2004**, 1727–1730. (d) Salavati-Niasari, M.; Hydarzadeh, S. J. Mol. Catal. A: Chem. **2005**, 237, 254–258.

(15) When methyl malonate was treated with 10 mol % of $InCl_3$ and D_2O (1.5 equiv) in toluene at 60 $^\circ C$ at 8 h, the formation of methyl malonate incorporating deuterium (42:58 H/D) was observed by NMR measurement.
