S Supporting Information

ABSTRACT: A highly efficient and generally applicable iodine-catalyzed reaction of arylacetylenic acids and arylacetylenes with sodium sulfinates for the synthesis of arylacetylenic sulfones was developed. The methodology has the advantages of a metal-free strategy, easy to handle reagents, functional group tolerance, a wide range of arylacetylenic acids and arylacetylenes, and easy access to arylacetylenic sulfones.

INTRODUCTION

Sulfur-containing compounds are of great importance in organic synthesis, pharmaceuticals, bioactive products, medicines, agrochemicals, semiconductors, and organic dyes. Among them, organosulfone compounds have attracted enormous attention because they occur in a number of compounds exhibiting important biological activities¹ and show tremendous synthetic utility.² Therefore, the development of general methods for the synthesis of organosulfone compounds is consequently an important goal in organic chemistry. The construction of the C–SO₂ bond is important, and the installation of sulfone moiety into the organic molecules via C–SO₂ bond formation has therefore drawn remarkable attention.³ A number of sulfonyl precursors including sulfonyl halides,⁴ sulfonyl selenides,⁵ sulfonyl cyanides,⁶ sulfonyl azides,⁷ sulfonyl hydrazides,⁸ sodium sulfinates,⁹ sulfinic acids,¹⁰ and sulfoxides¹¹ were employed to access organosulfone compounds.

Acetylenic sulfones are an important class of organosulfone compounds, and their synthetic applications are well documented.¹² A number of synthetic routes are available toward the synthesis of acetylenic sulfones.¹³ Most recently, Singh and co-workers described, in part, a combination of arylsulfonyl hydrazide, molecular iodine (I₂), *tert*-butyl hydroperoxide (TBHP), and DBU in aqueous acetonitrile to access acetylenic sulfones from 3-phenylpropionic acid.^{13e} Although the reported methods for acetylenic sulfone synthesis are highly efficient, alternative methodologies employing commercially available starting materials and operationally simple methods are still desirable. With our continuing interest in developing efficient methods for the synthesis of organosulfur compounds,¹⁴ we report herein our results on the combination of I₂–TBHP-mediated decarboxylative sulfonylation of arylacetylenic acids and sulfonylation of arylacetylenes employing sodium sulfinates as sulfur sources (Scheme 1). Our method

Scheme 1. Iodine-Catalyzed Sulfonylation of Arylacetylenic Acids and Arylacetylenes with Sodium Sulfinates

offers several advantages, including being transition-metal-free, employing stable reagents, involving simple handling under air-stable conditions, accommodating a variety of substrates, and avoiding the formation of toxic byproducts.

RESULTS AND DISCUSSION

To evaluate the potential for acetylenic sulfone formation, the reaction between 3-phenylpropionic acid (**1a**) and sodium *p*-toluenesulfonate (**2a**) was examined under various reaction parameters in order to screen for the optimum reaction conditions, and the results are summarized in Table 1. To our delight, when 3-phenylpropionic acid (**1a**, 0.5 mmol) was treated with sodium *p*-toluenesulfonate (**2a**, 3 equiv) with molecular iodine (I₂, 1 equiv), *tert*-butyl hydroperoxide (TBHP, 5 equiv), and potassium carbonate (K₂CO₃, 1 equiv) in acetonitrile (2 mL) and the resulting mixture was stirred at room temperature (30–32 °C) for 24 h, the corresponding acetylenic sulfone **3a** was obtained in 51% yield (Table 1, entry 1). Next, various solvents, including ethanol, tetrahydrofuran, 1,4-dioxane, dichloroethane, and toluene, were screened (Table 1, entries 2–6). Among those, tetrahydrofuran was found to be an optimum solvent yielding **3a** in significantly improved yield (88% yield, Table 1, entry 3). It was pleasing to find that the reaction time can be shortened (from 24 to 16 h), and a comparable yield of **3a** was observed (Table 1, entry 7). The amount of sodium *p*-toluenesulfonate (**2a**) employed can be as

^aReaction conditions: **1a** (0.5 mmol) in solvent (2 mL), rt (30–32 °C), open air. ^bIsolated yields after column chromatography (SiO₂). ^cReaction was performed in refluxing THF (9 h). ^d**3a** was not observed (TLC analysis).

low as 2 equiv; further reduction of the amount of **2a** caused a drastic decrease in product yield (Table 1, entries 8 and 9). Further attempts to highlight the role of reagents employed were also investigated. External base (K₂CO₃) can be excluded from the reaction without affecting the reaction efficiency (Table 1, entry 10). Furthermore, the stoichiometry of TBHP can be lowered (from 5 to 3 equiv), and molecular iodine can be employed in substoichiometric quantities (50 mol %) (Table 1, entries 11 and 12). An effort to drive the reaction to completion by conducting the reaction in refluxing THF for 9 h was unsuccessful; there was no improvement in yield, but a significant decrease in product yield was observed (Table 1, entry 12). A further decrease in the iodine quantity (from 0.5 to 0.25 equiv) led to poorer results (Table 1, entry 13). Finally, the reaction did not take place in the absence of molecular iodine catalyst, and only a trace amount of **3a** was observed (TLC analysis) when TBHP was excluded from the reaction (Table 1, entries 14 and 15). The observed results further emphasized the important roles of both molecular iodine and TBHP in the present reaction. It is worth mentioning here that attempts to replace aqueous TBHP with TBHP in decane or other peroxide reagents including aqueous hydrogen peroxide, cumene hydroperoxide, di-*tert*-butyl peroxide, dicumyl peroxide, and *tert*-butyl benzoperoxoate gave inferior results.

After extensive experimentation, the optimum reaction conditions for the iodine-catalyzed decarboxylative sulfonylation of arylacetylenic acids were chosen as follows: **1a** (1 equiv), **2a** (2 equiv), I₂ (50 mol %), and TBHP (3 equiv) in THF at room temperature for 16 h (Table 1, entry 12). With the optimized reaction conditions in hand, we next explored the generality and functional group compatibility of this transformation under the established reaction conditions, and the results are summarized in Tables 2 and 3.

Initially, the scope of the decarboxylative sulfonylation of 3-phenylpropionic acid (**1a**) with a collection of sodium sulfonates was investigated as shown in Table 2. The reactions of 3-phenylpropionic acid (**1a**) with sodium arenosulfonates bearing electronically different groups on the *para* position (*p*-CH₃, *p*-

Table 2. Scope of Sodium Sulfonates^a

^aConditions: **1a** (0.5 mmol), **2** (2 equiv), I₂ (0.5 equiv), 70% TBHP in H₂O (3 equiv) in THF (2 mL), rt (30–32 °C), 16 h. In parentheses: isolated yields after chromatographic purification (SiO₂ column chromatography).

OCH₃, *p*-Cl, *p*-Br) gave the corresponding products **3a–e** in low to good yields (29–86% yields); sodium *p*-bromobenzenesulfonates is a poor sulfonate salt. Under standard reaction conditions, sodium methanesulfonate gave the corresponding product **3f** in low yield (20% yield). On the other hand, we observed no formation of acetylenic sulfones when sterically hindered sodium mesitylenesulfonate and electron-deficient sulfonates including sodium 2,4-dinitrobenzenesulfonate and sodium trifluoromethanesulfonate were employed; an unidentifiable polar mixture was observed (TLC analysis).

Next, the reactions between various types of arylacetylenic acids **1** with sodium *p*-toluenesulfonate (**2a**) were examined as shown in Table 3. Under the established reaction conditions, the reactions of sodium *p*-toluenesulfonate (**2a**) with electronically different *para*-substituted arylacetylenic acid derivatives (*p*-CH₃, *p*-OCH₃, and *p*-CF₃) smoothly gave the corresponding products **3g–i** in good yields (68–90% yields). In the case of *para*-halosubstituted arylacetylenic acids (*p*-F and *p*-Br), the corresponding acetylenic sulfones **3j,k** were obtained in moderate quantities (47–80% yields). Arylacetylenic acid bearing a strong electron-attracting group (*p*-NO₂) was also suitable for this process, although it diverted to the

Table 3. Scope of Arylacetylenic Acids^a

^aConditions: **1a** (0.5 mmol), **2** (2 equiv), I₂ (0.5 equiv), 70% TBHP in H₂O (3 equiv) in THF (2 mL), rt (30–32 °C), 16 h. In parentheses: isolated yields after chromatographic purification (SiO₂ column chromatography).

corresponding acetylenic sulfone **3l** in relatively low yield (32% yield). Arylacetylenic acids bearing substituents at the *meta* position (*m*-CH₃ and *m*-Cl) could also be converted to their corresponding acetylenic sulfones **3m,n** in high yields (69–90% yields). The electronic and steric effects were evident when 3-(2-bromophenyl)propionic acid was employed as a starting material; an evident decrease of reaction yield of **3o** was observed. Notably, arylacetylenic acids bearing substituents at the *ortho* and *para* positions were also effective substrates in this transformation furnishing the corresponding products **3p,q** in good yields (67–83% yields). 3-(Naphthalen-2-yl)propionic acid and 3-heteroarylpropionic acid, i.e., 3-(thiophene-2-yl)propionic acid, are also good substrates providing **3r** and **3s** in 53% and 63% yields, respectively. Nevertheless, the present protocol was found to be incompatible with β -alkyl- and β -silyl-substituted propionic acids. 2-Butynoic acid failed to give any of the desired acetylenic sulfone product. Efforts to employ 3-(triisopropylsilyl)propionic acid and 3-(*tert*-butyldimethylsilyl)propionic acid as the substrates were also examined albeit without success; the starting acids were recovered in both cases. It is noteworthy that a scaling up experiment (5 mmol) between **1a** and **2a** was also investigated under the optimized conditions, and **3a** was obtained in comparable efficiency (82% yield).

To gain a better understanding of the reaction mechanism, a series of control experiments were carried out (Scheme 2). The reaction of 3-phenylpropionic acid (**1a**) with sodium *p*-toluenesulfonate (**2a**) was conducted under the standard reaction conditions in the presence of radical inhibitors, including hydroquinone and 2,2,6,6-tetramethyl-1-piperidinyloxy (TEMPO) [Scheme 2 (a)]. Hydroquinone was found to retard the reaction, while TEMPO almost ceased the reaction. Although the radical-trapping adducts were not isolated, the observed results implied that the reaction is likely to involve a radical pathway. There has been a previous report that arylpropionic acids were capable of undergoing halodecarboxylation to provide 1-haloalkynes.¹⁵ We then separately prepared (iodoethynyl)benzene (**4**)¹⁶ and employed **4** in place of 3-phenylpropionic acid (**1a**) under standard reaction conditions. Interestingly, **3a** was isolated in 53% yield, suggesting that **4** might also be an intermediate in the present

reaction [Scheme 2 (b)]. However, under the standard reaction conditions but in the absence of **2a**, **1a** did not provide any isolable products [Scheme 2 (c)]. GC/MS analysis of the reaction mixture before aqueous workup indicated the formation of phenylacetylene (**5a**). However, after aqueous workup, **1a** was recovered in 90% yield. This observation suggested that under the reaction conditions **1a** was unlikely converted to either **4** or **5a**. Indeed, decarboxylative sulfonylation of **1a** to **3a** is unlikely to proceed through the intermediate **4** or **5a**. The detection of **5a** urged us to investigate the reaction of phenylacetylene (**5a**) and sodium *p*-toluenesulfonate (**2a**) under our standard reaction conditions [Scheme 2 (d)]. Gratifyingly, we were pleased to observe that **5a** reacted with **2a** under the standard conditions, yielding the corresponding acetylenic sulfone **3a** in moderate yield (56% yield). Next, the reactions of 3-phenylpropionic acid (**1a**) and phenylacetylene (**5a**) with *p*-toluenesulfonyl iodide¹⁷ were examined [Scheme 2 (e)]. To our surprise, acetylenic sulfone **3a** was not observed in both cases; interestingly, phenylacetylene (**5a**) yielded (*E*)-(1-iodo-2-(phenylsulfonyl)vinyl)benzene (**6a**) in 83% yield. This outcome suggested that sulfonyl iodide is unlikely to be a key precursor to react with **1a** or **5a** to lead to acetylenic sulfone **3a**. Finally, it was found that sulfonyl iodide cannot be generated upon treatment of sodium *p*-toluenesulfonate (**2a**) with molecular iodine in THF at room temperature [Scheme 2 (f)]. On the contrary, under our standard reaction conditions (I₂, TBHP, THF, rt), the sulfonyl iodide can be detected (TLC analysis) but disappeared upon stirring overnight [Scheme 2 (f)].

On the basis of the results described above and relevant literature,¹³ tentative reaction mechanisms for this metal-free decarboxylative sulfonylation of arylacetylenic acids are proposed using 3-phenylpropionic acid (**1a**) and sodium *p*-toluenesulfonate (**2a**) as the model substrates (Scheme 3). Since the reactions were extremely sluggish or did not occur if neither I₂ nor TBHP was employed under the typical reaction conditions (Table 1, entries 14 and 15), this observation implied that to lead to the desired acetylenic sulfones both of I₂ and TBHP did not directly react with substrates during the reaction. Indeed, two possible pathways are proposed for the in situ generation of sulfonyl radical intermediate [Scheme 3 (b)].

Scheme 3. Proposed Reaction Mechanism

(a) Formation of electrophilic iodine species

(b) Formation of sulfonyl radical

(c) Formation of acetylenic sulfones

(d) Regeneration of molecular iodine

vinyl radical intermediate F [Scheme 3 (c)].^{13d} The acetylenic sulfone **3a** was obtained upon elimination of hydrogen radical. In this work, the (iodoethynyl)benzene (**4**) can also be converted to acetylenic sulfone **3a** through a similar pathway

via a proposed intermediate **G** [Scheme 3 (c)]. Finally, the HI generated in the reaction could be reoxidized leading to I_2 to resume the catalytic cycle [Scheme 3 (d)].¹⁹

The synthetic utility of the present protocol was further extended to the sulfonylation of arylacetylenes. The reaction of electronically different arylacetylenes **5** with sodium arenesulfonates **2** under the established reaction conditions for decarboxylative sulfonylation of arylacetylenic acids **1** was evaluated, and the results are summarized in Table 4. Delightfully, arylacetylenes **5** were found to be capable of undergoing sulfonylation reaction to yield the respective arylacetylenic sulfones **3**, albeit in lower efficiency. Except for **3l** where a trace amount of the product was observed (TLC analysis), the yields were moderate (42–68% yields). Arylacetylenes bearing electron-withdrawing substituents gave poorer yields in comparison to those bearing electron-releasing substituents. While the reaction of phenylacetylene with sodium *p*-bromobenzenesulfonate gave acetylenic sulfone **3e** in low yield (17% yield), those with sodium mesitylenesulfonate and sodium 2,4-dinitrobenzenesulfonate did not provide the desired products. This observation is in accordance with those observed when arylacetylenic acids were employed as the starting compounds (Tables 2 and 3). Interestingly, under the standard reaction conditions [sodium *p*-toluenesulfonate (2 equiv), I_2 (0.5 equiv), 70% TBHP in H_2O (3 equiv), THF, rt, 16 h], terminal aliphatic alkyne, 1-octyne, did not yield alkyacetylenic sulfone but led to the corresponding (*E*)- β -iodovinyl sulfone **6b** (confirmed by NOE experiments) in low yield (26% yield) [Scheme 4 (a)]. Notably, internal alkynes,

under the established reaction conditions, also yielded the corresponding (*E*)- β -iodovinyl sulfones **6c–e**, albeit in low yields (14–27% yields) [Scheme 4 (b)].

CONCLUSION

In summary, a highly efficient synthesis of arylacetylenic sulfones has been developed. Under identical reaction conditions, arylacetylenic acids underwent decarboxylative sulfonylation while arylacetylenes underwent sulfonylation to yield the acetylenic sulfones in moderate to excellent yields. The established methodology offers a benign metal-free protocol, ease of experimentation (room temperature), and open-flask reaction. The expansion of the synthetic application of this chemistry is currently under investigation in our laboratory.

EXPERIMENTAL SECTION

General Procedure. All isolated compounds were characterized on the basis of ^1H NMR and ^{13}C NMR spectroscopic data, IR spectra, and HRMS data. ^1H NMR and ^{13}C NMR chemical shifts are reported in ppm using tetramethylsilane (TMS) as an internal standard or residual nondeuterated solvent peak as an internal standard.

General Procedure for the Synthesis of Arylpropionic Acids.²⁰ Aryl iodide (5.0 mmol), DBU (1.83 g, 12 mmol, 2.4 equiv), and Pd(PPh₃)₄ (144 mg, 2.5 mol %) were mixed in DMSO (6 mL). The solution of propionic acid (420 mg, 6.0 mmol, 1.2 equiv) in DMSO (6 mL) was poured into the flask. The mixture was stirred at room temperature for 12 h. After the reaction was complete, EtOAc (20 mL) was poured into the reaction mixture. The reaction mixture was extracted with saturated aqueous NaHCO₃ solution. The aqueous layer was separated, acidified to pH 2.0 by addition of cold HCl (1 N), and extracted with EtOAc. The combined organic layers were dried with anhydrous MgSO₄ and filtered, and the solvent was removed under reduced pressure. The resulting crude product was purified by column chromatography on silica gel.

General Procedure for the Synthesis of Acetylenic Sulfones from Arylacetylenic Acids or Arylacetylenes. To a solution of arylacetylenic acid or arylacetylene (0.5 mmol) with sodium sulfinate (1 mmol) and iodine (0.25 mmol) in THF (2 mL) was added TBHP (70% in water, 1.5 mmol). The resulting mixture was stirred at room temperature for 16 h. The reaction mixture was quenched by the addition of saturated aqueous Na₂S₂O₃ (5 mL). Further stirring was followed by extraction with EtOAc (2 \times 20 mL). The combined organic extracts were washed with H₂O (20 mL) and brine (20 mL), dried (MgSO₄), filtered, and concentrated (aspirator). The residue was purified by column chromatography using EtOAc/hexanes as eluent to afford the corresponding product.

1-Bromo-4-((phenylethynyl)sulfonyl)benzene (3e). white solid (46.6 mg, 29% yield from 3-phenylpropionic acid; 27.3 mg, 17% yield from phenylacetylene); mp = 98–100 °C (from CH₂Cl₂/hexanes); ^1H NMR (400 MHz; CDCl₃) δ 7.96–7.92 (m, 2 H), 7.76–7.72 (m, 2 H), 7.54–7.47 (m, 3 H), 7.40–7.36 (m, 2 H) ppm; ^{13}C NMR (100 MHz; CDCl₃) δ 140.8 (C), 132.8 (2 \times CH), 132.7 (2 \times CH), 131.7 (CH), 129.6 (C), 128.9 (2 \times CH), 128.7 (2 \times CH), 117.6 (C), 94.0 (C), 85.0 (C) ppm; IR (neat) ν 2179 (C \equiv C), 1326 and 1151 (SO₂) cm⁻¹; HRMS (ESI-TOF) *m/z* [M + Na]⁺ calcd for C₁₄H₉BrO₂SNa 342.9404, found 342.9418.

((Methylsulfonyl)ethynyl)benzene (3f).^{12h} yellow liquid (18.0 mg, 20% yield from 3-phenylpropionic acid); ^1H NMR (400 MHz; CDCl₃) δ 7.59–7.57 (m, 2 H), 7.51 (t, *J* = 7.5 Hz, 1 H), 7.41 (t, *J* = 7.6 Hz, 2 H), 3.30 (s, 3 H) ppm; ^{13}C NMR (100 MHz; CDCl₃) δ 132.8 (2 \times CH), 131.7 (CH), 128.7 (2 \times CH), 117.4 (C), 91.4 (C), 84.4 (C), 46.7 (CH₃) ppm; IR (neat) ν 2180 (C \equiv C), 1316 and 1139 (SO₂) cm⁻¹; HRMS (ESI-TOF) *m/z* [M + Na]⁺ calcd for C₉H₈O₂SNa 203.0143, found 203.0142.

1-Methyl-4-((p-tolylolethynyl)sulfonyl)benzene (3g).^{13b} pale yellow solid (121.6 mg, 90% yield from 3-(p-tolyl)propionic acid; 91.9 mg, 68% yield from 1-ethynyl-4-methylbenzene); mp = 101–103 °C (from CH₂Cl₂/hexanes) (lit.^{13b} mp = 100–101 °C); ^1H NMR (400 MHz; CDCl₃) δ 7.95 (d, *J* = 8.2 Hz, 2 H), 7.40–7.37 (m, 4 H), 7.16 (d, *J* = 7.9 Hz, 2 H), 2.45 (s, 3 H), 2.35 (s, 3 H) ppm; ^{13}C NMR (100 MHz; CDCl₃) δ 145.2 (C), 142.2 (C), 139.0 (C), 132.5 (2 \times CH), 129.9 (2 \times CH), 129.3 (2 \times CH), 127.3 (2 \times CH), 114.7 (C), 93.6 (C), 85.1 (C), 21.6 (CH₃), 21.5 (CH₃) ppm; IR (neat) ν 2176 (C \equiv C), 1327 and 1154 (SO₂) cm⁻¹; HRMS (ESI-TOF) *m/z* [M + Na]⁺ calcd for C₁₆H₁₄O₂SNa 293.0612, found 293.0616.

1-Methoxy-4-((p-tolylolethynyl)sulfonyl)benzene (3h).^{13b} yellow amorphous solid (114.5 mg, 80% yield from 3-(4-methoxyphenyl)propionic acid; 88.8 mg, 62% yield from 1-ethynyl-4-methoxybenzene); mp = 77–79 °C (from CH₂Cl₂/hexanes); ^1H NMR (400 MHz; CDCl₃) δ 7.95 (d, *J* = 8.3 Hz, 2 H), 7.45 (d, *J* = 8.9 Hz, 2 H), 7.38 (d, *J* = 8.1 Hz, 2 H), 6.86 (d, *J* = 8.9 Hz, 2 H), 3.82 (s, 3 H), 2.46 (s, 3 H) ppm; ^{13}C NMR (100 MHz; CDCl₃) δ 162.1 (C), 145.1 (C), 139.2 (C), 134.6 (2 \times CH), 129.9 (2 \times CH), 127.3 (2 \times CH), 114.4 (2 \times CH), 109.5 (C), 94.1 (C), 84.8 (C), 55.4 (CH₃), 21.6 (CH₃) ppm; IR (neat) ν 2169 (C \equiv C), 1324 and 1151 (SO₂) cm⁻¹; HRMS (ESI-TOF) *m/z* [M + Na]⁺ calcd for C₁₆H₁₄O₃SNa 309.0561, found 309.0554.

1-Methyl-4-(((4-trifluoromethyl)phenyl)ethynyl)sulfonyl)benzene (3i).^{12c} pale yellow solid (110.3 mg, 68% yield from 3-(4-(trifluoromethyl)phenyl)propionic acid); mp = 112–113 °C (from CH₂Cl₂/hexanes); ^1H NMR (400 MHz; CDCl₃) δ 7.96 (d, *J* = 8.3 Hz, 2 H), 7.63 (s, 4 H), 7.41 (d, *J* = 8.2 Hz, 2 H), 2.47 (s, 3 H) ppm; ^{13}C NMR (100 MHz; CDCl₃) δ 145.8 (C), 138.4 (C), 133.0 (2 \times CH), 132.9 (q, *J* = 33 Hz, C), 130.1 (2 \times CH), 127.6 (2 \times CH), 125.6 (q, *J* = 3 Hz, 2 \times CH), 123.3 (q, *J* = 271.0 Hz, C), 121.8 (C), 90.3 (C), 87.3

(C), 21.7 (CH₃) ppm; IR (neat) ν 2188 (C \equiv C), 1319 and 1155 (SO₂) cm⁻¹; HRMS (ESI-TOF) m/z [M + Na]⁺ calcd for C₁₆H₁₁F₃O₂SNa 347.0330, found 347.0331.

1-Fluoro-4-(tosylethynyl)benzene (3j):^{12e} pale yellow solid (64.5 mg, 47% yield from 3-(4-fluorophenyl)propionic acid; 75.4 mg, 55% yield from 1-ethynyl-4-fluorobenzene); mp = 75–77 °C (from CH₂Cl₂/hexanes); ¹H NMR (400 MHz; CDCl₃) δ 7.94 (d, J = 8.2 Hz, 2 H), 7.51 (dd, J = 8.7, 5.4 Hz, 2 H), 7.39 (d, J = 8.0 Hz, 2 H), 7.06 (t, J = 8.6 Hz, 2 H), 2.46 (s, 3 H) ppm; ¹³C NMR (100 MHz; CDCl₃) δ 164.2 (d, J = 253 Hz, C), 145.4 (C), 138.8 (C), 135.0 (d, J = 9 Hz, 2 \times CH), 130.0 (2 \times CH), 128.7 (d, J = 198 Hz, C), 127.4 (2 \times CH), 116.3 (d, J = 23 Hz, 2 \times CH), 91.8 (C), 85.5 (C), 21.7 (CH₃) ppm; IR (neat) ν 2179 (C \equiv C), 1330 and 1151 (SO₂) cm⁻¹; HRMS (ESI-TOF) m/z [M + Na]⁺ calcd for C₁₅H₁₁FO₂SNa 297.0361, found 297.0365.

1-Bromo-4-(tosylethynyl)benzene (3k):^{13c} white solid (134.1 mg, 80% yield from 3-(4-bromophenyl)propionic acid); mp = 107–108 °C (from CH₂Cl₂/hexanes); ¹H NMR (400 MHz; CDCl₃) δ 7.95 (d, J = 8.4 Hz, 2 H), 7.52 (d, J = 8.5 Hz, 2 H), 7.41–7.36 (m, 4 H), 2.47 (s, 3 H) ppm; ¹³C NMR (100 MHz; CDCl₃) δ 145.6 (C), 138.7 (C), 133.9 (2 \times CH), 132.1 (2 \times CH), 130.0 (2 \times CH), 127.6 (2 \times CH), 126.4 (C), 116.9 (C), 91.5 (C), 86.6 (C), 21.7 (CH₃) ppm; IR (neat) ν 2179 (C \equiv C), 1330 and 1156 (SO₂) cm⁻¹; HRMS (ESI-TOF) m/z [M + Na]⁺ calcd for C₁₅H₁₁BrO₂SNa 356.9561, found 356.9570.

1-Methyl-4-((4-nitrophenyl)ethynyl)sulfonylbenzene (3l):^{13a} pale yellow solid (48.2 mg, 32% yield from 3-(4-nitrophenyl)propionic acid); mp = 164–165 °C (from CH₂Cl₂/hexanes) (lit.^{13a} mp = 166–167 °C); ¹H NMR (400 MHz; CDCl₃) δ 8.23 (d, J = 8.8 Hz, 2 H), 7.96 (d, J = 8.3 Hz, 2 H), 7.69 (d, J = 8.8 Hz, 2 H), 7.42 (d, J = 8.1 Hz, 2 H), 2.48 (s, 3 H) ppm; ¹³C NMR (100 MHz; CDCl₃) δ 148.9 (C), 146.1 (C), 138.1 (C), 133.6 (2 \times CH), 130.2 (2 \times CH), 127.7 (2 \times CH), 124.5 (C), 123.8 (2 \times CH), 89.2 (C), 89.1 (C), 21.8 (CH₃) ppm; IR (neat) ν 2181 (C \equiv C), 1337 and 1155 (SO₂) cm⁻¹; HRMS (ESI-TOF) m/z [M + Na]⁺ calcd for C₁₅H₁₁NO₄SNa 324.0306, found 324.0308.

1-Methyl-3-(tosylethynyl)benzene (3m): pale yellow solid (121.6 mg, 90% yield from 3-(*m*-tolyl)propionic acid); mp = 77–78 °C (from CH₂Cl₂/hexanes); ¹H NMR (400 MHz; CDCl₃) δ 7.95 (d, J = 8.3 Hz, 2 H), 7.39 (d, J = 8.3 Hz, 2 H), 7.33–7.24 (m, 4 H), 2.46 (s, 3 H), 2.32 (s, 3 H) ppm; ¹³C NMR (100 MHz; CDCl₃) δ 145.3 (C), 139.0 (C), 138.5 (C), 133.1 (CH), 132.4 (CH), 129.9 (2 \times CH), 129.8 (CH), 128.5 (CH), 127.4 (2 \times CH), 117.7 (C), 93.3 (C), 85.3 (C), 21.7 (CH₃), 21.0 (CH₃) ppm; IR (neat) ν 2160 (C \equiv C), 1334 and 1159 (SO₂) cm⁻¹; HRMS (ESI-TOF) m/z [M + Na]⁺ calcd for C₁₆H₁₄O₂SNa 293.0612, found 293.0605.

1-Chloro-3-(tosylethynyl)benzene (3n): pale yellow solid (83.9 mg, 69% yield from 3-(3-chlorophenyl)propionic acid); mp = 108–110 °C (from CH₂Cl₂/hexanes); ¹H NMR (400 MHz; CDCl₃) δ 7.86 (d, J = 8.3 Hz, 2 H), 7.38–7.30 (m, 5 H), 7.22 (t, J = 7.9 Hz, 1 H), 2.38 (s, 3 H) ppm; ¹³C NMR (100 MHz; CDCl₃) δ 145.6 (C), 138.5 (C), 134.5 (C), 132.2 (CH), 131.7 (CH), 130.7 (CH), 130.0 (2 \times CH), 129.9 (CH), 127.5 (2 \times CH), 119.6 (C), 90.7 (C), 86.4 (C), 21.7 (CH₃) ppm; IR (neat) ν 2182 (C \equiv C), 1336 and 1163 (SO₂) cm⁻¹; HRMS (ESI-TOF) m/z [M + Na]⁺ calcd for C₁₅H₁₁ClO₂SNa 313.0066, found 313.0073.

1-Bromo-2-(tosylethynyl)benzene (3o): pale yellow solid (58.7 mg, 35% yield from 3-(2-bromophenyl)propionic acid; 82.1 mg, 49% yield from 1-bromo-2-ethynylbenzene); mp = 50–52 °C (from CH₂Cl₂/hexanes); ¹H NMR (400 MHz; CDCl₃) δ 7.98 (d, J = 8.3 Hz, 2 H), 7.59–7.57 (m, 1 H), 7.51–7.49 (m, 1 H), 7.39 (d, J = 8.1 Hz, 2 H), 7.33–7.28 (m, 2 H), 2.47 (s, 3 H) ppm; ¹³C NMR (100 MHz; CDCl₃) δ 145.5 (C), 138.7 (C), 134.3 (CH), 132.8 (C), 132.4 (CH), 129.9 (2 \times CH), 127.4 (2 \times CH), 127.2 (CH), 126.4 (C), 120.6 (C), 90.9 (C), 89.0 (C), 21.7 (CH₃) ppm; IR (neat) ν 2182 (C \equiv C), 1329 and 1152 (SO₂) cm⁻¹; HRMS (ESI-TOF) m/z [M + Na]⁺ calcd for C₁₅H₁₁BrO₂SNa 356.9561, found 356.9558.

4-Methoxy-2-methyl-1-(tosylethynyl)benzene (3p): amorphous solid (100.6 mg, 67% yield from 3-(4-methoxy-2-methylphenyl)propionic acid); ¹H NMR (400 MHz; CDCl₃) δ 7.94 (d, J = 8.2 Hz, 2 H), 7.39–7.35 (m, 3 H), 6.71–6.67 (m, 2 H), 3.79 (s, 3 H), 2.45 (s, 3

H), 2.34 (s, 3 H) ppm; ¹³C NMR (100 MHz; CDCl₃) δ 162.0 (C), 145.0 (C), 144.6 (C), 139.5 (C), 134.7 (CH), 129.8 (2 \times CH), 127.1 (2 \times CH), 115.4 (CH), 111.8 (CH), 109.6 (C), 93.8 (C), 88.4 (C), 55.3 (CH₃), 21.6 (CH₃), 20.6 (CH₃) ppm; IR (neat) ν 2161 (C \equiv C), 1321 and 1152 (SO₂) cm⁻¹; HRMS (ESI-TOF) m/z [M + Na]⁺ calcd for C₁₇H₁₆O₃SNa 323.0718, found 323.0717.

2,4-Dimethoxy-1-(tosylethynyl)benzene (3q): yellow liquid (262.6 mg, 83% yield from 3-(2,4-dimethoxyphenyl)propionic acid); ¹H NMR (400 MHz; CDCl₃) δ 7.93 (d, J = 8.2 Hz, 2 H), 7.35–7.32 (m, 3 H), 6.42 (dd, J = 8.6, 2.0 Hz, 1 H), 6.36 (d, J = 1.6 Hz, 1 H), 3.80 (s, 3 H), 3.79 (s, 3 H), 2.43 (s, 3 H) ppm; ¹³C NMR (100 MHz; CDCl₃) δ 163.9 (C), 163.3 (C), 144.7 (C), 139.6 (C), 135.6 (CH), 129.7 (2 \times CH), 127.1 (2 \times CH), 105.6 (CH), 99.4 (C), 98.1 (CH), 92.3 (C), 88.2 (C), 55.7 (CH₃), 55.5 (CH₃), 21.6 (CH₃) ppm; IR (neat) ν 2161 (C \equiv C), 1321 and 1151 (SO₂) cm⁻¹; HRMS (ESI-TOF) m/z [M + Na]⁺ calcd for C₁₇H₁₆O₄SNa 339.0667, found 339.0663.

2-(Tosylethynyl)naphthalene (3r): pale yellow solid (81.2 mg, 53% yield from 3-(naphthalen-2-yl)propionic acid); mp = 132–134 °C (from CH₂Cl₂/hexanes); ¹H NMR (400 MHz; CDCl₃) δ 8.07 (s, 1 H), 8.00 (d, J = 8.2 Hz, 2 H), 7.82–7.78 (m, 3 H), 7.58–7.51 (m, 2 H), 7.47 (d, J = 8.5 Hz, 1 H), 7.40 (d, J = 8.0 Hz, 2 H), 2.46 (s, 3 H) ppm; ¹³C NMR (100 MHz; CDCl₃) δ 145.3 (C), 138.9 (C), 134.2 (CH), 134.0 (C), 132.3 (C), 130.0 (2 \times CH), 128.5 (CH), 128.3 (CH), 128.1 (CH), 127.8 (CH), 127.4 (2 \times CH), 127.3 (CH), 127.2 (CH), 115.0 (C), 93.4 (C), 85.7 (C), 21.7 (CH₃) ppm; IR (neat) ν 2181 (C \equiv C), 1334 and 1161 (SO₂) cm⁻¹; HRMS (ESI-TOF) m/z [M + Na]⁺ calcd for C₁₉H₁₄O₂SNa 329.0612, found 329.0609.

2-(Tosylethynyl)thiophene (3s): yellow solid (82.6 mg, 63% yield from 3-(thiophene-2-yl)propionic acid); mp = 87–88 °C (from CH₂Cl₂/hexanes); ¹H NMR (400 MHz; CDCl₃) δ 7.93 (d, J = 8.3 Hz, 2 H), 7.49 (dd, J = 5.0, 1.0 Hz, 1 H), 7.44 (dd, J = 3.7, 1.0 Hz, 1 H), 7.38 (d, J = 8.0 Hz, 2 H), 7.03 (dd, J = 5.0, 3.8 Hz, 1 H), 2.45 (s, 3 H) ppm; ¹³C NMR (100 MHz; CDCl₃) δ 145.4 (C), 138.7 (C), 137.0 (CH), 132.1 (CH), 130.0 (2 \times CH), 127.6 (CH), 127.4 (2 \times CH), 117.3 (C), 89.1 (C), 87.1 (C), 21.7 (CH₃) ppm; IR (neat) ν 2157 (C \equiv C), 1330 and 1159 (SO₂) cm⁻¹; HRMS (ESI-TOF) m/z [M + Na]⁺ calcd for C₁₃H₁₀O₂S₂Na 285.0020, found 285.0024.

1-Fluoro-3-(tosylethynyl)benzene (3t): white solid (57.6 mg, 42% yield from 1-ethynyl-3-fluorobenzene); mp = 88–90 °C (from CH₂Cl₂/hexanes); ¹H NMR (400 MHz; CDCl₃) δ 7.96 (d, J = 8.2 Hz, 2 H), 7.42–7.27 (m, 4 H), 7.21–7.16 (m, 2 H), 2.47 (s, 3 H) ppm; ¹³C NMR (100 MHz; CDCl₃) δ 162.0 (d, J = 247 Hz, C), 145.6 (C), 138.6 (C), 130.5 (d, J = 8 Hz, CH), 130.0 (2 \times CH), 128.6 (d, J = 3 Hz, CH), 127.5 (2 \times CH), 119.7 (d, J = 9 Hz, C), 119.3 (d, J = 24 Hz, CH), 118.9 (d, J = 21 Hz, CH), 90.9 (d, J = 4 Hz, C), 86.1 (C), 21.7 (CH₃) ppm; IR (neat) ν 2175 (C \equiv C), 1333 and 1152 (SO₂) cm⁻¹; HRMS (ESI-TOF) m/z [M + Na]⁺ calcd for C₁₅H₁₁FO₂SNa 297.0361, found 297.0369.

Synthesis of (E)-1-((2-iodo-2-phenylvinyl)sulfonyl)-4-methylbenzene (6a):^{14a} A solution of phenylacetylene (**5a**) (50.1 mg, 0.5 mmol) with *p*-toluenesulfonyl iodide (282.1 mg, 1 mmol) in THF (2 mL) was stirred at room temperature for 16 h. The reaction mixture was quenched by the addition of saturated aqueous Na₂S₂O₃ (5 mL). Further stirring was followed by extraction with EtOAc (2 \times 20 mL). The combined organic extracts were washed with H₂O (20 mL) and brine (20 mL), dried (MgSO₄), filtered, and concentrated (aspirator). The residue was purified by column chromatography using EtOAc/hexanes as eluent to afford **6a**: white solid (167.4 mg, 83% yield); mp = 80–82 °C (from CH₂Cl₂/hexanes) (lit.^{14a} mp = 77–79 °C); ¹H NMR (400 MHz; CDCl₃) δ 7.45 (d, J = 8.4 Hz, 2 H), 7.36 (s, 1 H), 7.32–7.26 (m, 3 H), 7.24–7.21 (m, 2 H), 7.18 (d, J = 8.0 Hz, 2 H), 2.38 (s, 3 H) ppm; ¹³C NMR (100 MHz; CDCl₃) δ 114.5 (C), 141.2 (CH), 139.6 (C), 137.2 (C), 129.7 (CH), 129.6 (2 \times CH), 127.9 (2 \times CH), 127.8 (2 \times CH), 127.6 (2 \times CH), 114.1 (C), 21.6 (CH₃) ppm; IR (neat) ν 3057, 2920, 1585, 1326, 1141, 1083 cm⁻¹; HRMS (ESI-TOF) m/z [M + Na]⁺ calcd for C₁₅H₁₃I₂O₂SNa 406.9579, found 406.9583.

General Procedure for the Synthesis of β -Iodovinyl Sulfones from Terminal Aliphatic Alkyne and Internal Alkynes. To a solution of alkyne (0.5 mmol) with sodium sulfinate (1 mmol) and

iodine (0.25 mmol) in THF (2 mL) was added TBHP (70% in water, 1.5 mmol). The resulting mixture was stirred at room temperature for 16 h. The reaction mixture was quenched by the addition of saturated aqueous $\text{Na}_2\text{S}_2\text{O}_3$ (5 mL). Further stirring was followed by extraction with EtOAc (2×20 mL). The combined organic extracts were washed with H_2O (20 mL) and brine (20 mL), dried (MgSO_4), filtered, and concentrated (aspirator). The residue was purified by column chromatography using EtOAc/hexanes as eluent to afford the corresponding product.

(*E*)-1-((2-iodooct-1-en-1-yl)sulfonyl)-4-methylbenzene (**6b**):^{14a} colorless viscous liquid (42.8 mg, 26% yield); ^1H NMR (400 MHz; CDCl_3) δ 7.77 (d, $J = 8.2$ Hz, 2 H), 7.35 (d, $J = 8.1$ Hz, 2 H), 7.00 (s, 1 H), 3.00 (t, $J = 7.4$ Hz, 2 H), 2.44 (s, 3 H), 1.53–1.49 (m, 2 H), 1.32–1.25 (m, 6 H), 0.90–0.85 (m, 3 H) ppm; ^{13}C NMR (100 MHz; CDCl_3) δ 144.8 (C), 138.9 (CH), 138.1 (C), 130.0 ($2 \times \text{CH}$), 127.5 ($2 \times \text{CH}$), 125.7 (C), 39.9 (CH_2), 31.5 (CH_2), 29.8 (CH_2), 28.1 (CH_2), 22.4 (CH_2), 21.6 (CH_3), 14.0 (CH_3) ppm; IR (neat) $\nu = 3044, 2956, 2929, 2858, 1597, 1456, 1379, 1322, 1303, 1147, 1086, 1018, 816, 768$ cm^{-1} ; HRMS (ESI-TOF) m/z calcd for $\text{C}_{15}\text{H}_{21}\text{IO}_2\text{SNa}$ [$\text{M} + \text{Na}$]⁺ 415.0205, found 415.0204.

(*E*)-(1-iodo-2-tosylethene-1,2-diyl)dibenzene (**6c**):^{18d} white solid (43.4 mg, 19% yield); mp = 191–193 °C (from CH_2Cl_2 /hexanes) (lit.^{18d} mp = 192–193 °C); ^1H NMR (400 MHz; CDCl_3) δ 7.37–7.32 (m, 8 H), 7.26 (d, $J = 8.2$ Hz, 2 H), 7.18–7.16 (m, 2 H), 7.09 (d, $J = 8.1$ Hz, 2 H), 2.36 (s, 3 H) ppm; ^{13}C NMR (100 MHz; CDCl_3) δ 149.1 (C), 144.2 (C), 142.5 (C), 139.3 (C), 136.7 (C), 130.3 ($2 \times \text{CH}$), 129.2 ($3 \times \text{CH}$), 129.0 (CH), 128.5 ($2 \times \text{CH}$), 128.3 ($2 \times \text{CH}$), 127.8 ($2 \times \text{CH}$), 127.3 ($2 \times \text{CH}$), 118.0 (C), 21.6 (CH_3) ppm; IR (neat) $\nu = 3053, 2922, 1619, 1596, 1318, 1150, 1087$ cm^{-1} ; HRMS (ESI-TOF) m/z [$\text{M} + \text{Na}$]⁺ calcd for $\text{C}_{21}\text{H}_{17}\text{IO}_2\text{SNa}$ 482.9892, found 482.9899.

(*E*)-1-((1-iodo-1-phenylprop-1-en-2-yl)sulfonyl)-4-methylbenzene (**6d**):^{18a} white solid (49.3 mg, 27% yield); mp = 128–129 °C (from CH_2Cl_2 /hexanes) (lit.^{18a} mp = 133–135 °C); ^1H NMR (400 MHz; CDCl_3) δ 7.39 (d, $J = 8.3$ Hz, 2 H), 7.24–7.22 (m, 3 H), 7.16 (d, $J = 8.1$ Hz, 2 H), 7.12–7.10 (m, 2 H), 2.51 (s, 3 H), 2.39 (s, 3 H) ppm; ^{13}C NMR (100 MHz; CDCl_3) δ 144.1 (C), 143.9 (C), 142.9 (C), 137.2 (C), 129.5 ($2 \times \text{CH}$), 128.6 (CH), 127.7 ($2 \times \text{CH}$), 127.6 ($2 \times \text{CH}$), 127.5 ($2 \times \text{CH}$), 115.7 (C), 27.0 (CH_3), 21.6 (CH_3) ppm; IR (neat) $\nu = 3059, 2922, 1623, 1593, 1315, 1151, 1079$ cm^{-1} ; HRMS (ESI-TOF) m/z [$\text{M} + \text{Na}$]⁺ calcd for $\text{C}_{16}\text{H}_{15}\text{IO}_2\text{SNa}$ 420.9735, found 420.9738.

(*E*)-1-((5-iodooct-4-en-4-yl)sulfonyl)-4-methylbenzene (**6e**): yellowish liquid (32.3 mg, 14% yield); ^1H NMR (400 MHz; CDCl_3) δ 7.74 (d, $J = 8.3$ Hz, 2 H), 7.33 (d, $J = 8.0$ Hz, 2 H), 3.15–3.11 (m, 2 H), 2.58–2.54 (m, 2 H), 2.44 (s, 3 H), 1.61–1.49 (m, 4 H), 0.94–0.88 (m, 6 H) ppm; ^{13}C NMR (100 MHz; CDCl_3) δ 143.7 (C), 143.4 (C), 137.6 (C), 128.8 ($2 \times \text{CH}$), 126.8 (C), 126.3 ($2 \times \text{CH}$), 44.0 (CH_2), 41.4 (CH_2), 22.8 (CH_2), 20.8 (CH_2), 20.6 (CH_3), 13.0 (CH_3), 11.9 (CH_3) ppm; IR (neat) $\nu = 2960, 2929, 1594, 1461, 1314, 1151, 1081$ cm^{-1} ; HRMS (ESI-TOF) m/z [$\text{M} + \text{Na}$]⁺ calcd for $\text{C}_{15}\text{H}_{21}\text{IO}_2\text{SNa}$ 415.0205, found 415.0212.

ACKNOWLEDGMENTS

We thank the Thailand Research Fund (BRG5850012), the Center of Excellence for Innovation in Chemistry (PERCH-CIC), and the Office of the Higher Education Commission, Mahidol University under the National Research Universities Initiative. Student scholarships from the Science Achievement Scholarship of Thailand (to J.M.) and the Development and Promotion of Science and Technology Talent Project (DPST) and the Institute for the Promotion of Teaching Science and Technology (to P.K.), are also gratefully acknowledged.
