ABSTRACT: A practical approach for the synthesis of tetracyclic pyrroloquinazolines using photoredox strategy has been developed. The visible-light-promoted intramolecular single-electron-transfer process between photocatalyst and *N*-(2-iodobenzyl)-*N*-acylcyanamides is considered to be involved in this transformation. Targeted pyrroloquinazoline derivatives (15 examples) are presented in good isolated yields (30%–88%).

Tetracyclic pyrroloquinazoline occurs as a key structural entity in dozens of natural products, such as luotonins A and E, mackinazolone, rutaecarpine, and deoxyvasicinone (Scheme 1).¹ These types of natural products disclose a wide

range of biological activities including the specific cytotoxicity and potent inhibition to proteases, which would be applicable in the discovery of pharmaceutical candidates.² Therefore, the synthesis of heterocyclic compounds bearing the tetracyclic pyrroloquinazoline scaffold has drawn intensive attention to synthetic chemists. Previously, the construction of tetracyclic pyrroloquinazoline scaffold commonly focused on the Pd-catalyzed cyclizations.³ For example, Li and co-workers reported a Pd-catalyzed approach to prepare tetracyclic pyrroloquinazolines from 2-bromo-*N*-(2-iodobenzyl)-benzamides, which underwent cyanation/*N*-addition/*N*-arylation reaction sequence in a two-stage and one-pot manner (Scheme 2a).^{3a} The Wu group also reported a decent method to prepare tetracyclic pyrroloquinazolines through palladium-catalyzed carbonylation of 2-bromobenzylamines with 2-bromoanilines (Scheme 2b).^{3b} In addition, tetracyclic pyrroloquinazolines could also be prepared through radical

approach.^{4,5} Malacria and co-workers described the AIBN/*n*-*Bu*₃SnH-mediated radical cascade cyclization of *N*-(2-iodobenzyl)-*N*-acylcyanamides to prepare pyrroloquinazoline-type polycyclic compounds (Scheme 2c).^{4a} A concise total synthesis of luotonin A was achieved using this strategy. The aforementioned methods are normally conducted at elevated temperature or proceed in the presence of toxic reagents (e.g., *n*-*Bu*₃SnH). These limitations considerably restrict not only the operational simplicity toward the preparation of this

pyrroloquinazoline-type tetracyclic compounds but also the pharmaceutical availability of compounds bearing this characteristic scaffold.

Inspired by these beautiful works, as well as our previous work with respect to the photoredox-catalyzed radical triple-bond insertions to construct various heterocycles,⁶ we envisioned that the tetracyclic pyrroloquinazolinanes could be prepared by photoredox-catalyzed intramolecular radical cyanide insertion of *N*-(2-iodobenzyl)-*N*-acylcyanamides (Scheme 2d). Several challenges associated with this approach have to be pointed out, including (1) the inertia of aryl iodides⁷ for the generation of aryl radical species upon photoredox conditions compared with other active aryl radical precursors, such as aryl diazonium salts⁸ and diaryliodonium salts,⁹ and (2) the inertia of the cyano group as the radical acceptor in photoredox catalysis.¹⁰

With these considerations in mind, we initially used *N*-acyl-*N*-(2-iodobenzyl)-cyanamide (**1a**)^{4a} as the model substrate to explore this transformation. To our delight, 30% yield of the desired pyrroloquinazoline **2a** based on ¹H NMR analysis was obtained when a solution of **1a**, TEA and *fac*-Ir(ppy)₃ (2.0 mol %) in MeCN was irradiated by white LED strips for 12 h at room temperature (Table 1, entry 1). The use of inorganic bases such as Na₂HPO₄ and KO^tBu instead of TEA could not give any of the desired product (entries 2–3). This phenomenon suggests that TEA not only was used as a base but also played as a quencher of photoexcited catalyst (*fac*-

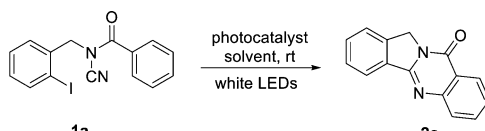

Ir(ppy)₃^{*}) in the catalytic cycle. We further screened a range of organic bases including Ph₃N, DIPEA, DBU, DMAP, NMM, and TMEDA (entries 4–9). DIPEA was proved to be the optimal organic base affording **2a** in 69% yield (entry 5). The employment of other commonly used photocatalysts (Ir(ppy)₂(dtbbpy)PF₆, Ir(dFCF₃ppy)₂(dtbbpy)PF₆, Ru(bpy)₃Cl₂, and Ru(Phen)₃(PF₆)₂) could not give any improvement of the yield (entries 10–13). Other solvents, such as DMF, MeOH, DMSO, and CH₂Cl₂, were not superior to MeCN in this transformation (entries 14–17). The use of 3.0 equiv of DIPEA gave a comparable yield of **2a** (entry 18). Satisfactorily, the NMR yield of **2a** could be increased to 87% (83% isolated yield) by diluting the reaction system to 0.02 M (entry 19). The reaction could not proceed without photocatalyst or visible light irradiation (entries 20–21).

With the optimized conditions in hand, we then intended to explore the scope of this transformation. In general, the desired cyclization products **2** with a 6/5/6/6 ring system were achieved in acceptable to excellent yields (Scheme 3). The substituents on the aryl of benzoyl motif could be a range of electronic donating or withdrawing functional groups (–OMe, –Me, –F, –Cl, –CF₃, –CN, CO₂Me), affording desired products **2a–2h** in 68%–88% yields. The aryl of benzoyl motif could also be 1- or 2-naphthalene (**2i**, 67% and **2j**, 83%) and 1-thiophene (**2k**, 33%). In addition, *N*-acylcyanamide derived from 2-iodophenylethanamine was also compatible in this transformation to give **2l** with a 6/6/6/6 ring system in 30% yield. Cinnamic acid-derived cyanamides were also suitable in this transformation to give tricyclic products **2m–2o** in 50%–86% yields, which were not achieved in the AIBN/*n*-Bu₃SnH-mediated radical cascade cyclization.⁴ The reaction could be scaled up to gram scale. When 3 mmol (1.09 g) of **1a** was subjected to standard conditions with 1.0 mol % of photocatalyst, the product **2a** could be isolated in 85% yield.

To investigate the mechanism of this reaction, a series of emission quenching experiments were performed to acquire further insight into the photoredox catalytic cycle. The experiments revealed that DIPEA quenched the excited state of *fac*-Ir(ppy)₃ (for details, see the Supporting Information). This result suggests that the reaction might undergo a reductive quenching mechanism. On the basis of the experimental observations, a plausible mechanism is proposed in Scheme 4. The catalytic cycle starts from the photoexcitation of *fac*-Ir(ppy)₃ upon visible light irradiation to generate the excited-state photocatalyst (*fac*-Ir(ppy)₃^{*}). The reductive quenching of *fac*-Ir(ppy)₃^{*} by DIPEA gives *fac*-Ir(ppy)₃[–] and *N*-centered radical cation species **7**.¹¹ Afterward, a single-electron transfer between *N*-acylcyanamide **1a** and *fac*-Ir(ppy)₃[–] affords an aryl radical intermediate **3**,⁷ which undergoes intramolecular radical cyclization to give radical intermediate **5**.¹² Subsequently, one-electron oxidation of **5** generates aryl cation intermediate **6**, following the aromatization to give tetracyclic pyrroloquinazoline **2a**.⁶

In summary, we have described a practical approach to construct polycyclic pyrroloquinazolines using photoredox-catalyzed intramolecular radical cyanide insertion. This photoredox neutral strategy proceeds under visible light irradiation at room temperature, and the experiments are easy to carry out. The hazardous radical initiator AIBN and toxic *n*-Bu₃SnH can be avoided, which renders this protocol particularly valuable in terms of green synthetic chemistry aspect.

EXPERIMENTAL SECTION

General Information. All reagents and solvents were used without further purification. Thin-layer chromatography (TLC) was performed on EMD precoated plates (silica gel 60 F254, Art 5715) and visualized by fluorescence quenching under UV light and by staining with phosphomolybdic acid or potassium permanganate, respectively. Column chromatography was performed on EMD Silica Gel 60

(300–400 Mesh) using a forced flow of 0.5–1.0 bar. ¹H NMR (400 MHz), ¹³C NMR (100 MHz), and ¹⁹F (376 MHz) were measured on a 400 M NMR spectrometer. Chemical shifts are expressed in parts per million (ppm) with respect to the residual solvent peak. Coupling constants are reported as Hertz (Hz), signal shapes and splitting patterns are indicated as follows: s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet. Infrared (IR) spectra were recorded on a IR spectrophotometer and are reported as wavenumber (cm⁻¹).

General Procedure for Preparation of *N*-(2-iodobenzyl)-cyanamides.^{4a} KOH (326 mg, 5.8 mmol) was added to a solution of *N*-(2-iodobenzyl)-cyanamide (1.5 g, 5.8 mmol)^{4a} in THF/H₂O (15 mL, v:v = 1:1). The mixture was stirred at ambient temperature for 30 min and concentrated under reduced pressure. Toluene (7 mL) was added to the residue. After cooling to 0 °C, acyl chloride (11 mmol) was added slowly. The mixture was then warmed to 25 °C and stirred for another 2 h. After the reaction was complete (as judged by TLC analysis), the reaction mixture was poured into a separatory funnel containing 20 mL of H₂O and 20 mL of CH₂Cl₂. The layers were separated, and the organic layers were extracted with H₂O (2 × 20 mL). The organic layers were dried over Na₂SO₄ and concentrated under reduced pressure after filtration. The crude product was purified by flash chromatography on silica gel to afford the desired product.

General Procedure for the Synthesis of Tetracycle Quinazolinones. A 10 mL round-bottom flask equipped with a rubber septum and magnetic stir bar was charged with *N*-cyano-*N*-(2-iodobenzyl)benzamide **1a** (0.2 mmol, 1.0 equiv), DIPEA (0.4 mmol, 2.0 equiv), and Ir(ppy)₃ (0.004 mmol, 0.02 equiv). The flask was evacuated and backfilled with nitrogen 3 times. MeCN (10.0 mL) was added with a syringe under nitrogen. The mixture was then irradiated by white LED strips. After the reaction was complete (as judged by TLC analysis), the mixture was concentrated under reduced pressure after filtration. The crude product was purified by flash chromatography on silica gel (petroleum ether/ethyl acetate = 10:1).

Isoidolo[1,2-*b*]quinazolin-10(12*H*)-one (**2a**).^{4a} Purification by chromatography (petroleum ether/EtOAc = 10:1) afforded **2a** as a yellow solid (38.8 mg, 83% yield). ¹H NMR (400 MHz, CDCl₃) δ 8.37 (d, *J* = 7.8 Hz, 1H), 8.17 (d, *J* = 7.5 Hz, 1H), 7.86–7.74 (m, 2H), 7.65–7.54 (m, 3H), 7.49 (t, *J* = 7.4 Hz, 1H), 5.14 (s, 2H); ¹³C NMR (100 MHz, CDCl₃) δ 160.7, 155.0, 149.5, 139.6, 134.3, 132.7, 132.4, 128.9, 127.4, 126.5, 126.4, 123.54, 123.51, 120.6, 49.8.

7-Methoxyisoidolo[1,2-*b*]quinazolin-10(12*H*)-one (**2b**).^{4c} Purification by chromatography (petroleum ether/EtOAc = 10:1) afforded **2b** as a yellow solid (38.6 mg, 73% yield). ¹H NMR (400 MHz, CDCl₃) δ 8.27 (d, *J* = 8.8 Hz, 1H), 8.17 (d, *J* = 7.6 Hz, 1H), 7.66–7.11 (m, 2H), 7.61–7.55 (m, 1H), 7.22 (d, *J* = 2.4 Hz, 1H), 7.06 (dd, *J* = 8.8, 2.4 Hz, 1H), 5.13 (s, 2H), 3.95 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 164.6, 160.3, 155.6, 151.8, 139.9, 132.7, 132.3, 128.9, 127.9, 123.5, 123.4, 116.6, 114.2, 108.0, 55.7, 49.7.

7-Methylisoidolo[1,2-*b*]quinazolin-10(12*H*)-one (**2c**).^{3b} Purification by chromatography (petroleum ether/EtOAc = 10:1) afforded **2c** as a yellow solid (36.7 mg, 74%). ¹H NMR (400 MHz, CDCl₃) δ 8.25 (d, *J* = 8.1 Hz, 1H), 8.20 (d, *J* = 7.6 Hz, 1H), 7.66–7.60 (m, 3H), 7.59–7.54 (m, 1H), 7.31 (dd, *J* = 8.1, 0.9 Hz, 1H), 5.13 (s, 2H), 2.52 (s, 3H); ¹³C NMR (100 MHz, CDCl₃) δ 160.5, 155.1, 149.3, 145.4, 139.7, 132.6, 132.4, 128.9, 128.1, 127.0, 126.3, 123.7, 123.5, 118.1, 49.8, 21.9.

7-Fluoroisoidolo[1,2-*b*]quinazolin-10(12*H*)-one (**2d**).^{3b} Purification by chromatography (petroleum ether/EtOAc = 10:1) afforded **2d** as a yellow solid (37.8 mg, 75%). ¹H NMR (400 MHz, CDCl₃) δ 8.39 (t, *J* = 7.3 Hz, 1H), 8.18 (d, *J* = 7.3 Hz, 1H), 7.73–7.56 (m, 3H), 7.48 (d, *J* = 9.5 Hz, 1H), 7.21 (t, *J* = 7.7 Hz, 1H), 5.16 (s, 2H); ¹³C NMR (100 MHz, CDCl₃) δ 166.5 (d, *J* = 253.5 Hz), 160.0, 156.2, 151.7 (d, *J* = 13.3 Hz), 139.8, 132.7, 132.4, 129.1 (d, *J* = 11.0 Hz), 129.0, 123.8, 123.6, 117.3, 115.1 (d, *J* = 23.5 Hz), 112.7 (d, *J* = 22.2 Hz), 49.9. ¹⁹F NMR (376 MHz, CDCl₃) δ -103.62;

7-Chloroisindolo[1,2-*b*]quinazolin-10(12*H*)-one (2e). Purification by chromatography (petroleum ether/EtOAc = 10:1) afforded **2e** as a yellow solid (47.3 mg, 88%). Mp: 236–238 °C; IR (film, cm^{-1}): 2974, 2920, 1668, 1619, 1597, 1549, 1454, 878, 773 cm^{-1} ; ^1H NMR (400 MHz, CDCl_3) δ 8.29 (d, $J = 8.5$ Hz, 1H), 8.16 (d, $J = 7.6$ Hz, 1H), 7.81 (d, $J = 1.9$ Hz, 1H), 7.69–7.56 (m, 3H), 7.43 (dd, $J = 8.5, 1.9$ Hz, 1H), 5.14 (s, 2H); ^{13}C NMR (100 MHz, CDCl_3) δ 160.1, 156.1, 150.5, 140.5, 139.8, 132.7, 132.4, 129.0, 127.9, 127.0, 126.9, 123.7, 123.5, 119.0, 49.9; HRMS-DART m/z calcd for $\text{C}_{15}\text{H}_{10}\text{ON}_2\text{Cl}^+ [\text{M} + \text{H}^+]$ 269.0476, found: 269.0476.

7-(Trifluoromethyl)isindolo[1,2-*b*]quinazolin-10(12*H*)-one (2f).^{3b} Purification by chromatography (petroleum ether/EtOAc = 10:1) afforded **2f** as a yellow solid (42.3 mg, 70%). ^1H NMR (400 MHz, CDCl_3) δ 8.47 (d, $J = 8.3$ Hz, 1H), 8.18 (d, $J = 7.6$ Hz, 1H), 8.11 (s, 1H), 7.74–7.56 (m, 4H), 5.17 (s, 2H); ^{13}C NMR (100 MHz, CDCl_3) δ 159.8, 156.2, 149.5, 139.7, 135.8 (q, $J = 32.9$ Hz), 132.9, 132.2, 129.2, 127.6, 124.9 (q, $J = 4.0$ Hz), 123.8, 123.6, 123.5 (q, $J = 27.3$ Hz), 122.8, 122.3 (q, $J = 4.1$ Hz), 50.0. ^{19}F NMR (376 MHz, CDCl_3) δ – 63.11.

10-Oxo-10,12-dihydroisindolo[1,2-*b*]quinazoline-7-carbonitrile (2g).^{4a} Purification by chromatography (petroleum ether/EtOAc = 10:1) afforded **2g** as a yellow solid (35.3 mg, 68%). ^1H NMR (400 MHz, CDCl_3) δ 8.47 (d, $J = 8.1$ Hz, 1H), 8.20 (d, $J = 7.5$ Hz, 1H), 8.15 (s, 1H), 7.72–7.63 (m, 4H), 5.19 (s, 2H); ^{13}C NMR (100 MHz, CDCl_3) δ 159.6, 156.6, 149.6, 139.8, 133.2, 132.2, 129.3, 128.1, 127.8, 124.0, 123.6, 123.5, 117.9, 117.6, 50.1.

Methyl 10-Oxo-10,12-dihydroisindolo[1,2-*b*]quinazoline-7-carboxylate (2h).^{4a} Purification by chromatography (petroleum ether/EtOAc = 10:1) afforded **2h** as a yellow solid (43.8 mg, 75%). ^1H NMR (400 MHz, CDCl_3) δ 8.51 (s, 1H), 8.43 (d, $J = 8.3$ Hz, 1H), 8.20 (d, $J = 7.5$ Hz, 1H), 8.09 (d, $J = 8.3$ Hz, 1H), 7.72–7.56 (m, 3H), 5.18 (s, 2H), 4.00 (s, 3H); ^{13}C NMR (100 MHz, CDCl_3) δ 166.2, 160.2, 155.7, 149.5, 139.7, 135.4, 132.7, 132.5, 129.3, 129.1, 126.8, 126.4, 123.7, 123.6, 123.5, 52.6, 49.9.

Benzof[*f*]isindolo[1,2-*b*]quinazolin-14(12*H*)-one (2i). Purification by chromatography (petroleum ether/EtOAc = 10:1) afforded **2i** as a yellow solid (38.1 mg, 67%).
