S Supporting Information

ABSTRACT: Earlier studies have shown that [3,3]-sigmatropic rearrangements of allyl esters are useful for the construction of fluorine-containing carboxylic acid derivatives. This paper describes the synthesis of 3-aryl-pent-4-enoic acid derivatives bearing either a pentafluorosulfanyl (SF₅) or a trifluoromethyl (CF₃) substituent in the 2-position by treatment of corresponding SF₅- or CF₃-acetates of p-substituted cinnamyl alcohols with triethylamine followed by trimethylsilyl triflate (TMSOTf). This Ireland– Claisen rearrangement delivered approximate 1:1 mixtures of syn/anti diastereoisomers due to tiny differences (<0.5 kcal/mol) both in the energy of (Z)/(E)-isomeric ester enolates and in the alternative Zimmerman−Traxler transition states of model compounds as shown by DFT calculations. Acidic reaction conditions have to be avoided since addition of the reagents in opposite sequence (first TMSOTf then Et_3N) led to oligomerization of the cinnamyl SF_5^- and CF_3 -acetates. Treatment of the corresponding regioisomeric 1-phenyl-prop-2-en-1-yl acetates under the latter conditions resulted in [1,3]-sigmatropic rearrangement and subsequent oligomerization of the intermediately formed cinnamyl esters. When Et₃N was added first followed by TMSOTf, no further reaction of the formed ester was detected.

■ INTRODUCTION

Rearrangement reactions belong to the most widely used methods to achieve an extension of the carbon scaffold of a given molecule. Here [3,3]-sigmatropic rearrangement reactions of the Claisen-type are of significant importance.¹ In 1912 Claisen described both the thermally induced rearrangement of an allyl aryl ether as well as the conversion of an allyl v[in](#page-9-0)yl ether to the corresponding allyl phenol and carbonyl compounds, respectively. 2 As of now, several variations of the original Claisen rearrangements have been developed. The Ireland− Claisen rea[rr](#page-9-0)angement is one of the well-known and most frequently employed variants. In this reaction, which was discovered in 1972, an allylic ester is initially transformed into the corresponding ester enolate. This 3-oxa-1,5-diene system then rearranges to form a γ , δ -unsaturated carboxylic acid.³ Like the aromatic and aliphatic Claisen rearrangements, the Ireland− Claisen variant can be performed in a stereoselective fa[s](#page-9-0)hion. Thereby, the stereochemistry of the $product(s)$ is determined by the geometry of the intermediately formed ester enolate(s) as well as by the conformation of the six-membered transition

state(s).3b Additional advantages of the Ireland−Claisen rearrangement are mild reaction conditions and the tolerance of vario[us](#page-9-0) functional groups.^{1c,d,4}

Due to the general interest in organofluorine compounds, 5 Ireland−Claisen rearrangem[ent re](#page-9-0)actions of substrates containing fluorine or the CF_3 group have been previousl[y](#page-9-0) studied by us⁶ and others.⁷ Likewise, in recent years the pentafluorosulfanyl (SF_5) group became increasingly interesting⁸ as a p[ot](#page-9-0)ential substi[tu](#page-9-0)te for the $CF₃$ group. However, all our attempts to involve different 3-pentafluorosulfanyl allyli[c](#page-9-0) esters with an $SF₅$ group as part of the allylic system in the rearrangement step failed.⁹ In contrast, Ireland−Claisen rearrangement of allylic $SF₅$ -acetates 1 derived from aliphatic allylic alcohols with either a [fl](#page-9-0)uorine atom or a hydrogen atom in the 2-position were converted into the corresponding carboxylic acids 2 using trimethylsilyltriflate (TMSOTf) and triethylamine in dichloromethane.¹⁰ (Scheme 1).

Scheme 1. Stereoselective Synthesis of trans-Configurated α - $SF₅$ -Substituted γ ,δ-Unsaturated Carboxylic Acids 2 by Ireland–Claisen Rearrangements¹⁰

The trans-configurated products were formed exclusively, although both (Z) - and (E) -ketene trimethylsilyl acetals were formed intermediately as proved in time-dependent NMR experiments. While the (Z) -ketene trimethylsilyl acetals rearranged smoothly, the (E) -isomers were stable under these and even more forcing conditions.¹⁰ During aqueous workup, the starting allylic esters are regenerated from the latter intermediates. As a consequence, i[nco](#page-9-0)mplete conversion of the starting material 1 was observed in all cases. The (Z) -ketene trimethylsilyl acetals most likely rearrange via an energetically favored six-membered transition state to give the transconfigurated carboxylic acids 2. For the first time, $SF₅$ substituted ester enolates were verified and characterized by NMR spectroscopy. Esters 1 with a phenyl group $(R = Ph)$ could not be converted into the corresponding carboxylic acids under the conditions shown in Scheme 1. Instead complex mixtures of unidentified products were obtained.¹⁰ Very recently, aldol-type reactions of $SF₅$ -substituted acetic acid esters with aldehydes proceeding via analogous ester [en](#page-9-0)olates have been described.¹¹

Herein, we would like to present our recent results on Ireland−Claisen re[arr](#page-9-0)angements of 2-(pentafluorosulfanyl) acetic acid cinnamyl esters. Moreover, we compare these reactions concerning reactivity and selectivity with those of the corresponding allylic CF_{3} - and CH_{3} -substituted acetates and illuminate the importance of the particular reaction conditions. Furthermore, two earlier attempts to rearrange SF_{5} -substituted acetates of secondary allyl alcohols 10 were repeated under the new optimized conditions.

■ RESULTS A[N](#page-9-0)D DISCUSSION

Synthesis of Cinnamyl SF_{5} - and CF_{3} -Acetates. For the [3,3]-sigmatropic rearrangements besides cinnamyl alcohol (5a) itself, also the 4-fluoro and 4-methyl derivatives 5b and $5c^{12}$ were synthesized by a two-step procedure starting from the commercial acids 3b and 3c according to known procedures (S[ch](#page-9-0)eme 2).^{13,14} Direct reduction of the acids with either lithium aluminum hydride $(LAH)^{15}$ or the borane dimethylsulfide comp[lex](#page-9-0) 16 16 16 were not successful.

Esterification of the alcohols 5 [wit](#page-9-0)h 2-(pentafluorosulfanyl) acetic acid $(6a)^{17}$ $(6a)^{17}$ $(6a)^{17}$ and commercially available 3,3,3-trifluoromethyl-propionic acid (6b) in the presence of N,N′ dicyclohexyl car[bo](#page-9-0)diimide (DCC) and 4-dimethylaminopyridine (DMAP) according to the protocol independently developed by Neises and Steglich^{18a} and Hassner and Alexanian^{18b} gave the desired $SF₅$ and $CF₃$ -substituted allylic esters 7a, 7b, and 7d-g. For the purpo[se](#page-9-0) of comparison in the Ireland–[Clai](#page-9-0)sen rearrangement, the known propionate $7c^{19}$

Scheme 2. Preparation of Cinnamyl Alcohols 5b and 5c

was prepared analogously starting from cinnamyl alcohol (5a) and propionic acid $(6c)$ (Table 1).

Table 1. Synthesis of Allylic Esters

The seven esters 7a−7g produced in this way were isolated in high purity after column chromatography in yields between 59 and 89%. No significant difference in yields of the $SF₅$ - and the CF_3 -substituted compounds has been observed.

Attempts of Ireland−Claisen Rearrangements. Having allylic esters 7a and 7b in hand, Ireland−Claisen rearrangements were attempted under the conditions (1. TMSOTf, 2. Et₃N, DCM, reflux) originally developed for intermediate formation of (trifluoromethyl)ketene silyl acetals (α -CF₃-ester enolate equivalents) in aldol-type reactions and ester enolate Claisen rearrangements²⁰ and optimized for rearrangements of allylic $SF₅$ -acetates of type 1 derived from aliphatic allylic alcohols with either a fl[uo](#page-9-0)rine atom or a hydrogen atom in the 2-position.¹⁰ Surprisingly, the expected α , β -disubstituted carboxylic acids 8a and 8b were not obtained. Instead an oligomeriz[atio](#page-9-0)n of the starting allylic esters occurred (see below). Interestingly, compound 9a and the corresponding $CF₃$ and even the $CH₃$ analogues $9b$ and $9c$ also failed to rearrange to the expected products 10a, 10b, and 10c (Scheme 3), respectively. Under the same conditions they oligomerized as well. Also, the *p*-fluorophenyl and the 1-naphthyl a[nalogues](#page-2-0) 9d and $9e$ (Y = CF_3 , not shown in Scheme 3) have been synthesized. Likewise, these allylic esters oligomerized under the aforementioned conditions.

This is surprising since, in the latter [cases,](#page-2-0) [exten](#page-2-0)sion of the π system from benzenes 9a−9c to styrene derivatives 10a−10c and formation of a disubstituted double bond from a monosubstituted terminal one in the starting materials were expected to be driving forces for the $\lceil 3,3 \rceil$ -sigmatropic rearrangement. Instead of the target products, mixtures of

Scheme 3. Failure of [3,3]-Sigmatropic Rearrangement of Cinnamyl 7a and 7b and Substituted 1-Phenylprop-2-en-1 yl-acetates 9a−9c

oligomers were formed according to the ESI-mass spectra, which show products with m/z values between 500 and 1200. Moreover, in the ¹H NMR spectra of the crude product mixtures, broad multiplets and absence of signals of vinylic protons provide hints on oligomeric structures (see SI). Comparing the spectra of the mixtures of oligomeric products formed from either the cinnamyl acetates 7a and 7b or [th](#page-9-0)e secondary allyl acetates 9a and 9b, we realized that they looked almost identical. Consequently, we anticipated that slightly acidic conditions are created when TMSOTf is added to the allylic esters in methylene chloride before $Et₃N$ addition. In the case of esters 9 this gives rise to the possibility of an electrophilic attack of a proton or a trimethylsilyl cation equivalent E^+ on the carbonyl oxygen initiating a [1,3]sigmatropic shift of the ester function. This leads to the formation of benzylic cations of the corresponding cinnamyl esters 7, which oligomerize under the acidic conditions (Scheme 4).

TMSOTf is known to have some ionic character in dry, fairly nonpolar solvents like methylene chloride, but it is more ionic in a polar environment.²¹ Moreover, the reagent is useful as a Lewis acid in many carbonyl reactions²² and has been used as a catalyst in cationic pol[yme](#page-9-0)rization reactions.²³

In order to test whether sta[nd](#page-9-0)ard Ireland−Claisen conditions $3,6,7$ might work, we treated c[om](#page-9-0)pound 9b with LDA (1.2 equiv) and TMSCl (1.2 equiv) in THF at -78 °C to room tem[pera](#page-9-0)ture in an attempt to obtain 10b (Scheme 5). However, only the starting allylic ester 9b was recovered after workup. No products with a CF_3 group were found in the ¹⁹F

Scheme 5. Failure of Ireland−Claisen Rearrangement of 1- Phenylprop-2-en-1-yl-(3,3,3-trifluoropropionate) (9b)

NMR spectrum of the crude product. Treatment of 9b with 2.5 equiv of LDA led to decomposition.

In contrast, 1-(phenylprop-2-en-1-yl) propionate $(9c)$ and its p-fluorophenyl- and 1-naphthyl derivatives 9f and 9g formed from the corresponding allylic alcohols underwent [3,3] sigmatropic rearrangements under identical conditions, and the corresponding methyl esters 10c, 10f, and 10g were isolated after methylation of the initially formed carboxylic acids with methyl iodide (Scheme 6).

Rearrangements under the New Reaction Conditions.

From the results described in the former section, we concluded that an initial acidic environment is responsible for the failure of rearrangement of compounds 9a, 9b, and the substituted cinnamyl acetates 7. Therefore, we hypothesized that basic conditions from the beginning might facilitate the rearrangement. We first chose compound 1a to study the reaction by ^{19}F NMR spectroscopy. Indeed, when the order of addition of the reagents to compound 1a in dichloromethane- d_2 was reversed, i.e. first addition of triethylamine followed by TMSOTf, the formation of the intermediate (Z)-ketene trimethylsilyl acetal was faster (¹⁹F NMR spectroscopy, see SI) and after refluxing for 24 h and workup, the yield of 2a was increased from 65% under the original conditions¹⁰ to 93% (19 19 19 F NMR spectroscopy) (Scheme 7, Figure 1).

In contrast, the allylic es[ter](#page-9-0) 9a, which yielded oligomeric prod[ucts under the origi](#page-3-0)nal conditions, 10 did not react under these new conditions (Scheme 7).

It is surprising that 9a and also 9b [did](#page-9-0) not rearrange with Et₃N/TMSOTf since [DFT calcul](#page-3-0)ations (TPSS-D3/def2-TZVP

Scheme 4. Anticipated Mechanism of [1,3]-Sigmatropic Rearrangement of Substituted 1-Phenylprop-2-en-1-yl-acetates 9 and Subsequent Oligomerization of the Benzylic Cations of the Corresponding Cinnamyl Acetates 7

Scheme 7. Results of the Treatment of 1a and 9a under the Optimized Reaction Conditions

Figure 1. Comparison of the results of [3,3]-sigmatropic rearrangement of 1a under the original $(1. TMSOTF, 2. Et₃N, top)$ and the new (1. Et₃N, 2. TMSOTf, bottom) reaction conditions (SF₅-part of ¹⁹F NMR spectra after work up).

Table 2. Calculated Free Energies of Proton Transfer [kcal/ mol, 298 K] to Model (E) - and (Z) -Ester Enolates and pK_a Values of Substituted Acetic Acid Esters in CH_2Cl_2

+ COSMO) show that the methylene protons of 9a and 9b should be significantly more acidic than those of 9c. This was estimated by the free energies of proton transfer from the model esters C, D, and E to the cyclopentadienyl anion (cyclopentadiene: $pK_a = 18$, in CH_2Cl_2) forming ester enolates (Table 2, for details see SI).

Moreover, when comparing the activation energies for the [3,3]-sigmatropic rearran[ge](#page-9-0)ments of the ketene silylacetal of **9a** with that of model compounds A and B (derived from the SF_s acetic esters of 2-fluoro-but-1-en-3-ol and but-1-en-3-ol, see SI), it becomes clear that all rearrangements should proceed. In all cases the (E) -ketene trimethylsilyl acetals are thermodyn[am](#page-9-0)ically favored by 1−2 kcal/mol over the (Z)-ketene trimethylsilyl acetals (Table 3).

In all cases the activation energies for the transformation of the (Z)-ketene trimethylsilyl acetals to the favored chair transition states of [3,3]-sigmatropic rearrangements are 4−5 kcal/mol lower in energy than those of the boat transition states. Moreover, the activation energy for the transformation of the (E)-ketene trimethylsilyl acetals to the favored boat transition states is 3−5 kcal/mol higher in energy when compared to the activation energy for the transformation of the (Z)-ketene trimethylsilyl acetals to their chair transition states. As previously stated from NMR experiments with $1a$, 10 and proved by the present calculations, the rearrangement is proceeding exclusively via the corresponding (Z)-[ke](#page-9-0)tene trimethylsilyl acetal, while the (E) -ketene trimethylsilyl acetal did not rearrange. The latter was hydrolyzed to the starting ester 1a during aqueous work up. Thus, from an energetic point of view, the phenyl-substituted ester 9a should rearrange more easily, provided that the ester enolates were formed at all under the respective reaction conditions.

Fortunately, the undesired oligomerization reactions of cinnamyl acetates 7 occurring under the original reaction conditions¹⁰ could be suppressed by using the new conditions and thereby avoiding an acidic environment. In this case [3,3] sigmatrop[ic r](#page-9-0)earrangements resulted in the formation of almost 1:1 mixtures of the target diastereoisomeric products 8 (Table 4). In analogy to our earlier studies, $10¹⁰$ the amount of the carboxylic acids 8 in the crude reaction mixture was determined [b](#page-4-0)y 19F NMR spectroscopy. Subsequent [co](#page-9-0)nversion of the [acids](#page-4-0) 8 into the methyl esters 15 allowed for a simpler isolation and purification of the γ,δ-unsaturated α -substituted carboxylic esters by column chromatography. Surprisingly, the initially used alkylation method (K₂CO₃, MeI, DMF, 0^{\circ}C, 3 h) did not exclusively give the target methyl esters 15, since the $SF₅$ -group served as a leaving group²⁴ and was partially substituted by a formate group, probably via an intermediate α -lactone (see SI). Therefore, the carboxylic [aci](#page-10-0)ds 8 were treated with methanol in

Table 3. Relative Energies of (Z/E) -Isomeric Ketene Trimethylsilyl Acetals and Chair and Boat Transition States of [3,3[\]-](#page-9-0) Sigmatropic Rearrangements

the presence of DCC and a catalytic amount of $DMAP^{18}$ (Table 4).

The esters 7 were rearranged to the corresponding carboxy[lic](#page-9-0) acids 8 in 68–94% yields $(^{19}F$ NMR spectroscopy), whereby no significant influence of the SF_{5} - and CF_{3} -substituents on the conversion of the starting materials has been observed. All carboxylic acids 8 were obtained as approximate 1:1-mixtures of both diastereomers. Unfortunately, we were not able to separate the acids or the esters in order to assign the syn-/ anti-configurations to specific compounds.

In order to find an explanation for the observed low diastereoselectivity, DFT calculations (PW6B95-D3//TPSS-D3/def2-TZVP + COSMO solvation model), were carried out (for details see SI). As a model system, the Ireland−Claisen rearrangement of the $SF₅$ -substituted allylic ester 7a to the corresponding [carb](#page-9-0)oxylic acids 8a was chosen, and all four possible transition states—depending on the original geometry of the ketene trimethylsilyl acetal $[(Z)-(E)$ -configuration] as well as on the feasible geometry of the transition states itself (chair-/boat-conformation)—were determined (see SI). The four different transition states are shown in Figure 2 along with the relative energies and the corresponding free energ[y b](#page-9-0)arriers (ΔG^{\ddagger}) for the [3,3]-sigmatropic rearrangement reaction.

Figure 2. Optimized transition states (DFT) of the Ireland−Claisen rearrangement of the model compound 7a with $Et₃N/TMSOTf$ to form diastereomeric acids 8a.

The calculated relative energies indicate that the formation of acids 8 is generally possible via all four transition states, although the transition states I, II, and IV are energetically slightly favored. Furthermore, the free energy barriers suggest that the rearrangement reaction is more likely to proceed via the two (Z) -configurated transition states I and II with the lowest energy barriers resulting in either the syn- or the antidiastereoisomer. However, transition states III and IV would lead to a similar product ratio of syn- and anti-isomers. Scheme 8 shows the anticipated mechanistic pathway−based on the DFT calculations−for the rearrangement of compound 7a [with](#page-5-0) the (Z)-ketene trimethylsilyl acetal as favored intermediate.

[■](#page-5-0) CONCLUSION

Ireland–Claisen rearrangements of SF₅- and CF₃-substituted acetic acid cinnamyl esters 7 have been investigated. While treatment with trimethylsilyl triflate (TMSOTf) followed by Et3N and subsequent refluxing in dichloromethane resulted in oligomerization, avoiding initial acidic conditions by reversing the addition sequence of reagents enabled the formation of the target diastereomeric 3-aryl-2-pentafluorosulfanylpent-4-enoic and 3-aryl-2-trifluoromethyl-pent-4-enoic acids 8 in good yields. The reaction products were obtained as approximate 1:1-mixtures of syn- and anti-isomers. The unexpected low diastereoselectivity is explained by similar energies of the intermediate (E) - and (Z) -ketene trimethylsilyl acetals and very tiny differences of energy barriers (DFT calculations) for the different transition states of the [3,3]-sigmatropic rearrangement reactions. Applying the new reaction conditions to the rearrangement of the $SF₅$ -substituted acetic acid ester 1a of 2fluorododec-1-en-3-ol resulted in a higher yield of product 2a due to faster formation of the rearranging (Z) -ketene trimethylsilyl acetal. The corresponding esters of 1-phenylprop-2-en-1-ol 9a and 9b failed to rearrange even under the new conditions.

EXPERIMENTAL SECTION

General Remarks. All reactions involving air and/or moisture sensitive compounds were performed under argon atmosphere applying the Schlenk technique. DCM was dried over $CaH₂$ and distilled. THF was freshly distilled over sodium and benzophenone. TLC was performed on coated silica gel plates Merck 60 F_{254} . The spots were detected with alkaline $KMnO₄$ solution. For the purification of the compounds by column chromatography, silica gel Merck 60 (0.063−0.2 mm) was used. Solvents for chromatography Scheme 8. Anticipated Mechanistic Pathway of the Ireland–Claisen Rearrangement of Compound 7a with Et₃N/TMSOTf

were purified prior to use. The NMR spectra were recorded either at 300, 400, or 500 MHz spectrometers. ¹H NMR spectra were referenced to TMS, ¹³C NMR spectra to the used deuterated solvent CDCl₃ or CD₂Cl₂, and ¹⁹F NMR spectra to CFCl₃ as the internal standards. Actually, the $SF₅$ group is an $AB₄$ spin pattern, although with high-field NMR spectrometers this pattern moves toward AX_4 so that the A part, which is given by the single axial fluorine atom, is marked as a quintet (qn). In all cases the signal of the four equatorial fluorine atoms appeared as a doublet of multiplets (dm). The coupling between the axial and the equatorial fluorine atoms correlates with the doublet coupling constant. Electrospray ionization (ESI) mass spectrometry was performed on a MicroToF spectrometer. 1- Phenylprop-2-en-1-ol,²⁵ 1-(4-fluorophenyl)prop-2-en-1-ol,²⁶ 1-(naphthalen-1-yl)prop-2-en-1-ol, 27 and 1-phenylprop-2-en-1-yl- $(2$ pentafluorosulfanyl)a[cet](#page-10-0)ate (9a) ¹⁰ were synthesized a[cco](#page-10-0)rding to known procedures. The spe[ctr](#page-10-0)oscopic data are in agreement with published ones. The allylic alcoh[ols](#page-9-0) $5b$ and $5c^{12}$ were prepared in twosteps from the corresponding cinnamic acids 3b and 3c via the corresponding methyl esters $4b^{28}$ and $4c^{29}$

DFT Calculations. All calculations we[re](#page-9-0) performed with the TURBOMOLE program (6.6[\).](#page-10-0)³⁰ The [s](#page-10-0)tructures were optimized without any geometry constraints using the TPSS functional³¹ and an atom-pairwise dispers[ion](#page-10-0) correction $(D3)$.^{32,33} A flexible triple- ζ basis set $(def2-TZVP)^{34}$ was used in all calc[ula](#page-10-0)tions. For the calculation of zero-point vibrational energies and free en[thalp](#page-10-0)y contributions, a rotor approximation w[as](#page-10-0) applied for vibrational modes with wavenumbers below 100 cm[−]¹ ³⁵ In addition, in the Ireland−Claisen reactions, . single-point calculations were performed with the hybrid functional $PW6B95(-D3).$ ³⁶ [Im](#page-10-0)plicit solvation was taken into account in these single point calculations with the COSMO model 37 as implemented in Turbomole (ε [=](#page-10-0) 9.08, CH₂Cl₂).

General Procedure for the Synthesis of A[lly](#page-10-0)lic Esters 7. DCC (1.2 equiv) was dissolved in dry DCM (8 mL) before the allylic alcohol 5 (1.2 mmol, 1.0 equiv) followed by the corresponding carboxylic acid (1.2 equiv) were added under argon atmosphere. A white precipitate was formed and a catalytic amount of DMAP was added. The mixture was stirred at rt overnight. The suspension was diluted with $Et₂O$ (25 mL) before the formed urea derivative was filtered off. The remaining solution was washed with H₂O (3×10) mL), 5% acetic acid (3×10 mL), and brine (3×10 mL) and dried over MgSO₄ before the solvent was removed under reduced pressure. The crude products were purified by column chromatography as indicated below.

Cinnamyl 2-(Pentafluorosulfanyl)acetate (7a). The allylic ester 7a was prepared according to the aforementioned general procedure starting from cinnamyl alcohol (5a) (150 mg, 1.12 mmol) and 2-
(pentafluorosulfanyl)acetic acid (6a)¹⁷ (259 mg, 1.39 mmol). After column chromatography (cyclohexane/EtOAc, 5:1) the target product was obtained as a colorless oil. Yield[: 2](#page-9-0)97 mg (88%). ¹H NMR (400 MHz, CDCl₃): δ 7.48–7.17 (m, 5H), 6.70 (dt, J = 15.9 Hz, J = 1.4 Hz, 1H), 6.27 (dt, $J = 15.7$ Hz, $J = 6.7$ Hz, 1H), 4.85 (dd, $J = 6.6$ Hz, $J =$ 1.3 Hz, 2H), 4.33 (qn, J = 7.6 Hz, 2H). ¹³C NMR (100 MHz, CDCl₃): δ 162.1 (qn, J = 4.5 Hz,), 135.9, 135.9, 128.8, 128.6, 126.9, 121.5, 70.7 $(qn, J = 16.9 \text{ Hz})$, 67.3. ¹⁹F NMR (282 MHz, CDCl₃): δ 79.0 (qn, 1F), 71.0 (dm, J = 147.8 Hz, 4F). MS-ESI: m/z 325.0292 [M + Na]⁺ calcd. for $C_{11}H_{11}F_5O_2SNa^+$ 325.0292.

Cinnamyl 3,3,3-Trifluoropropanoate (7b). The allylic ester 7b was prepared according to the aforementioned general procedure starting from cinnamyl alcohol (5a) (150 mg, 1.12 mmol) and 3,3,3 trifluoropropanoic acid (6b) (178 mg, 1.39 mmol). After column chromatography (cyclohexane/EtOAc, 5:1) the target product was obtained as a colorless liquid. Yield: 236 mg (87%). ¹ H NMR (300 MHz, CDCl₃): δ 7.45–7.22 (m, 5H), 6.68 (dt, J = 15.9 Hz, J = 1.3 Hz, 1H), 6.26 (dt, J = 15.9 Hz, J = 6.5 Hz, 1H), 4.82 (dd, J = 6.5 Hz, J = 1.3 Hz, 2H), 3.21 (q, $J = 10.1$ Hz, 2H). ¹³C NMR (75 MHz, CDCl₃): δ 164.1 (q, J = 4.2 Hz), 136.0, 135.4, 128.8, 128.5, 126.8, 123.4 (q, J = 276.2 Hz,), 122.0, 66.5, 39.7 (q, J = 31.1 Hz). 19F NMR (282 MHz, CDCl₃): δ –63.4 (t, J = 10.1 Hz, 3F). MS-ESI: m/z 267.0602 [M + Na]⁺ calcd. for $C_{12}H_{11}F_3O_2Na^+$ 267.0603.

Cinnamyl Propionate $(7c)$. The allylic ester 7c was prepared according to the aforementioned general procedure starting from cinnamyl alcohol $(5a)$ $(219 \text{ mg}, 1.63 \text{ mmol})$ and propionic acid $(6c)$ (144 mg, 1.95 mmol). After column chromatography (cyclohexane/ EtOAc, 10:1) the target product was obtained as a colorless liquid. Yield: 275 mg (89%). ¹H NMR (300 MHz, CDCl₃): δ 7.43–7.20 (m, 5H), 6.64 (dt, $J = 15.9$ Hz, $J = 1.4$ Hz, 1H), 6.28 (dt, $J = 15.9$ Hz, $J =$ 6.4 Hz, 1H), 4.73 (dd, J = 6.4 Hz, J = 1.4 Hz, 2H), 2.37 (q, J = 7.6 Hz, 2H), 1.16 (t, J = 7.6 Hz, 3H). ¹³C NMR (75 MHz, CDCl₃): δ 174.3, 136.3, 134.1, 128.7, 128.1, 126.7, 123.4, 65.0, 27.7, 9.2. The spectroscopic data agree with those given in the literature.¹⁶ MS-ESI: m/z 213.0882 [M + Na]⁺ calcd. for C₁₂H₁₄O₂Na⁺ 213.0886.

(E)-4-Fluorocinnamyl 2-(Pentafluorosulfanyl)acetate (7d[\).](#page-9-0) The allylic ester 7d was prepared according to the aforementioned general procedure starting from (E) -3-(4-fluorophenyl)prop-2-en-1-ol $(5b)$ (150 mg, 0.99 mmol) and 2-(pentafluorosulfanyl)acetic acid (6a) (221 mg, 1.19 mmol). After column chromatography (cyclohexane/EtOAc, 5:1) the target product was obtained as a clear liquid. Yield: 189 mg (60%). ¹H NMR (400 MHz, CDCl₃): δ 7.43–7.29 (m, 2H), 7.10– 6.93 (m, 2H), 6.67 (dt, $J = 15.8$ Hz, $J = 1.3$ Hz, 1H), 6.19 (dt, $J = 15.9$ Hz, $J = 6.7$ Hz, 1H), 4.84 (dd, $J = 6.7$ Hz, $J = 1.3$ Hz, 2H), 4.34 (qn, J $= 7.7$ Hz, 2H). ¹³C NMR (100 MHz, CDCl₃): δ 162.9 (d, J = 248.0 Hz), 162.1 (qn, J = 4.6 Hz), 134.7, 132.1, 128.5 (d, J = 8.2 Hz), 121.2 $(d, J = 2.3 \text{ Hz})$, 115.8 $(d, J = 21.8 \text{ Hz})$, 70.7 $(qn, J = 16.9 \text{ Hz})$, 67.2. ¹⁹F NMR (282 MHz, CDCl₃): δ 79.0 (qn, 1F), 71.0 (dm, J = 147.7 Hz, 4F), -113.6 (tt, J = 8.6 Hz, J = 4.3 Hz, 1F). General Procedure for the Ireland−Claisen Rearrangements. The corresponding allylic ester (1.00 mmol, 1.00 equiv) was dissolved in dry DCM (3 mL) and Et_3N (3.0 equiv) followed by TMSOTf (1.2 equiv) were added to a sealable tube. The tube was sealed, and the reaction mixture was heated at 40 °C for 24 h. The sealed tube was then opened and $Et₂O$ (20 mL) and 2 M HCl (10 mL) were added to the solution, and the mixture was stirred at rt for 3 h (elimination of the TMS group). The phases were separated, and the aqueous layer was extracted with Et₂O (3×20 mL). The combined organic layers were washed with 2 M HCl (20 mL) and brine (20 mL) and dried over MgSO₄ before the solvent was removed under vacuum. The produced crude diastereomeric carboxylic acids 8 were investigated by 19F NMR spectroscopy and by ESI mass spectrometry and used without purification for the esterification reaction to obtain the diastereomeric methyl esters 15.

2-(Pentafluorosulfanyl)-3-phenylpent-4-enoic Acids (8a). According to the general procedure cinnamyl 2-(pentafluorosulfanyl)acetate (7a) (0.151 g, 0.50 mmol, 1.0 equiv) was rearranged. The formed product was analyzed and subsequently alkylated without purification. Yield: 0.172 g (crude, 92% of $8a$, ¹⁹F NMR). ¹⁹F NMR (282 MHz, CDCl₃): δ 67.7 and 67.9 (dm, ²J_{F,F} = 147.2 Hz and ²J_{F,F} = 146.9 Hz, 4F), 80.8 and 81.2 (qn, $^{2}J_{F,F} = 147.7$ Hz or $^{2}J_{F,F} = 147.0$ Hz, 1F). MS-ES(+)-EM: calcd for $C_{11}H_{11}F_5O_2SNa^+$: $m/z = 325.0308 [M + Na]^+$, found 325.0292. MS-ES(−)-EM calcd for $C_{11}H_{10}F_5O_2S^-$: $m/z =$ 301.0316 [M-H][−] found 301.0327.

2-(Trifluoromethyl)-3-phenylpent-4-enoic Acids (8b). According to the general procedure (E) - cinnamyl 3,3,3-trifluoropropanoate $(7b)$ (0.122 g, 0.50 mmol, 1.0 equiv) was rearranged. The formed product was analyzed and subsequently alkylated without purification. Yield: 0.118 g (crude, 94% of $8b$, ¹⁹F NMR). ¹⁹F NMR (282 MHz, CDCl₃): δ −64.2 and −63.8 (d or dd, ³J_{H,F} = 7.5 Hz or ³J_{H,F} = 7.7 Hz, ⁴J_{H,F} = 1.3 Hz, 3F). MS-ES(+)-EM: calcd for $C_{12}H_{11}F_3O_2Na^+$: $m/z =$ 267.0604 [M + Na]⁺ , found 267.0603. MS-ES(−)-EM calcd for $C_{12}H_{10}F_3O_2^-$: $m/z = 243.0644$ [M-H]⁻, found 243.0638.

3-(4-Fluorophenyl)-2-(pentafluorosulfanyl)pent-4-enoic Acids (8d). According to the general procedure (E) -4-fluorocinnamyl 2-(pentafluorosulfanyl)acetate (7d) (0.128 g, 0.40 mmol, 1.0 equiv) was rearranged. The formed product was analyzed and subsequently alkylated without purification. Yield: 0.153 g (crude, 92% of 8d, ^{19}F NMR). ¹⁹F NMR (282 MHz, CDCl₃): δ –115.3 and –114.6 (tt, ³J_{H,F}

= 8.5 Hz, $^{4}J_{\text{H,F}}$ = 5.2 Hz, 1F), 67.7 and 67.8 (dm, $^{2}J_{\text{F,F}}$ = 147.1 Hz or ^{2}I = 147.0 Hz, 4F), 80.8 and 81.3 (ap ^{2}I = 148.2 Hz or ^{2}I = $J_{F,F}$ = 147.0 Hz, 4F), 80.8 and 81.3 (qn, $^{2}J_{F,F}$ = 148.2 Hz or $^{2}J_{F,F}$ = 146.9 Hz, 1F). MS-ES(+)-EM: calcd for $C_{11}H_{10}F_6O_2SNa^+$: $m/z =$ 343.0210 [M + Na]⁺ , found 343.0198. MS-ES(−)-EM: calcd for $C_{11}H_{9}F_{6}O_{2}S^{-}$: $m/z = 319.0239$ [M-H]⁻, found 319.0233.

2-(Trifluoromethyl)-3-(4-fluorophenyl)pent-4-enoic Acids (8e). According to the general procedure (E) -4-fluorocinnamyl 3,3,3trifluoropropanoate (7e) (0.262 g, 1.00 mmol, 1.0 equiv) was rearranged. The formed product was analyzed and subsequently alkylated without purification. Yield: 0.225 g (crude, 75% of 8e, 19 F NMR). ¹⁹F NMR (282 MHz, CDCl₃): δ –114.8 and –114.6 (tt, ³J_{H,F} = 8.8 Hz, $^{4}J_{H,F}$ = 5.4 Hz or $^{3}J_{H,F}$ = 8.6 Hz, $^{4}J_{H,F}$ = 5.3 Hz, 1F, 9-CF), -64.7 and -64.4 (d or dd, $^3J_{\text{H,F}}$ = 7.6 Hz or $^3J_{\text{H,F}}$ = 7.8 Hz, $^4J_{\text{H,F}}$ = 1.3 Hz, 3F, 12-CF₃). MS-ES(+)-EM: calcd. for $C_{12}H_{10}F_4O_2Na^+$: $m/z =$ 285.0514 [M + Na]⁺, found 285.0509. MS-ES(-)-EM: calcd. for $C_{12}H_9F_4O_2^-$, $m/z = 261.0543$ [M-H]⁻ found 261.0544.

2-(Pentafluorosulfanyl)-3-(p-tolyl)pent-4-enoic Acids (8f). According to the general procedure (E) -4-methylcinnamyl 2-(pentafluorosulfanyl)acetate (7f) (0.158 g. 0.50 mmol, 1.0 equiv) was rearranged. The formed product was analyzed and subsequently alkylated without purification. Yield: 0.135 g (crude, 68% of $8f$, ^{19}F NMR). ¹⁹F NMR (282 MHz, CDCl₃): δ 67.7 and 67.8 (dm, ²J_{F,F} = 147.3 Hz or ²J_{F,F} = 146.9 Hz, 4F), 80.8 and 81.2 (qn, ²J_{F,F} = 147.1 Hz or ${}^{2}J_{F,F} = 147.1$ Hz, 1F). MS-ES(+)-EM: calcd. for $C_{12}H_{13}F_{5}O_{2}SNa^{+}$: $m/z = 339.0447$ [M + Na]⁺, found 339.0449. MS-ES(-)-EM: calcd. for C₁₂H₁₂F₅O₂S⁻: $m/z = 315.0483$ [M-H]⁻, found 315.0484.

2-(Trifluoromethyl)-3-(p-tolyl)pent-4-enoic Acids (8g). According to the general procedure (E) -4-methylcinnamyl 3,3,3-trifluoropropanoate (7g) (0.258 g, 1.00 mmol, 1.0 equiv) was rearranged. The formed product was analyzed and subsequently alkylated without purification. Yield: 0.220 g (crude, 78% of 8g, ¹⁹F NMR). ¹⁹F NMR $(282 \text{ MHz}, \text{CDCl}_3): \delta -64.7 \text{ and } -64.3 \text{ (d or dd, }^{3}J_{\text{H,F}} = 7.5 \text{ Hz or }^{3}J_{\text{H,F}} = 7.7 \text{ Hz}^{-4}J_{\text{H,F}} = 1.3 \text{ Hz}^{-3} \text{R} \text{ MSEs} \text{(a)} \text{EM} \text{; called for }^{3}J_{\text{H,F}} = 7.7 \text{ Hz}^{-4}J_{\text{H,F}} = 1.3 \text{ Hz}^{-3} \text{R} \text{m} \text{J} \text{J} \text{K} = 1.3 \text{ Hz}^{ J_{\text{H,F}}$ = 7.7 Hz, $^{4}J_{\text{H,F}}$ = 1.3 Hz, 3F). MS-ES(+)-EM: calcd for $C_{13}H_{13}F_3O_2Na^+$: $m/z = 281.0758 [M + Na]^+$, found 281.0760. MS-ES(-)-EM: calcd. for $C_{13}H_{12}F_3O_2^-$, $m/z = 257.0805$ [M-H]⁻, found 257.0795.

Methylation of Carboxylic Acids 8 with $K_2CO_3/$ Mel in DMF. The rearrangement products 8 have been difficult to isolate. Therefore, we preferred to methylate them with methyl iodide. First, we attempted methylation with potassium carbonate in DMF. However, under these conditions, the yields of the desired $SF₅$ -substituted methyl esters 15 were rather low, and side products were formed in yields up to 50% (determined by GC). By way of example, the crude product mixture 8f was treated with $K_2CO_2/DMF/MeI$, and the product mixture was separated by repeated column chromatography. Besides the fraction of the target diastereomeric $SF₅$ -substituted esters 15f, we also isolated a fraction of an 1:1 mixture of the diastereomeric methyl α -formyl carboxylates, which could not be separated. Thus, the $SF₅$ group is a leaving group under these conditions. In the literature, several examples have been reported where the $SF₅$ group served as a leaving group, 38 and we found other examples more recently. ²⁴ The decomposition of the SF_5^- anion to generate fluoride and SF_4 and subsequent d[eco](#page-10-0)mposition of SF_4 might be a driving [for](#page-10-0)ce for the reaction.³⁹

Procedure for Methylation of Carboxylic Acids 8f with Mel/K₂CO₃ in DMF. [A](#page-10-0) stirred suspension of the diastereomeric acids 8f (135 mg, 0.427 mmol) and K_2CO_3 (88 mg, 0.640 mmol) in DMF (2.0 mL) was cooled to 0 °C, and methyl iodide (0.05 mL, 0.854 mmol) was added slowly. Stirring was continued at 0 °C for 3 h. Then the reaction was stopped by the addition of water (10 mL). The mixture was extracted with diethyl ether $(3 \times 10 \text{ mL})$. The organic layers were combined, washed once with water (10 mL) and with brine $(4 \times 5 \text{ mL})$, and dried over MgSO₄. The solvent was removed under reduced pressure, and the resulting crude clear oil (104 mg) was purified by column chromatography on silica gel (pentane/diethyl ether, 20:1). After three runs, a mixture of the $SF₅$ -substituted esters 15f (12 mg, 8%, see below) and a mixture of the formates A and B were isolated. Yield: 39 mg (37%). The relative configuration could not be assigned to the respective isomers A and B.

Isomer **A.** ¹H NMR (400 MHz, CDCl₃): δ = 8.08 (t, ⁴J_{H,H} = 0.9 Hz, 1H), 7.18–7.10 (m, 4H), 6.17 (ddd, ${}^{3}J_{\text{H,Htrans}} = 17.0, {}^{3}J_{\text{H,Hcis}} = 10.3$,

Therefore, the methyl esters 15 were prepared analogously to the allylic esters. DCC (1.2 equiv) was dissolved in dry DCM (5 mL) before MeOH (1.0 equiv) followed by the corresponding carboxylic acids 8 (0.5 mmol, 1.0 equiv) were added under argon atmosphere. A white precipitate was formed and a catalytic amount of DMAP was added. The mixture was stirred at rt overnight. The suspension was diluted with Et_2O (20 mL) before the formed urea derivative was filtered off. The remaining solution was washed with H₂O (3×10) mL), 5% acetic acid (3×10 mL), and brine (3×10 mL) and dried over $MgSO₄$ before the solvent was removed under reduced pressure, and the mixture of diastereomeric methyl esters 15 was purified as described for the particular compounds.

Methyl 2-(Pentafluorosulfanyl)-3-phenylpent-4-enoates (15a). The title compounds were prepared according to the aforementioned general procedure starting from cinnamyl 2-(pentafluorosulfanyl) acetate (7a) (120 mg, 0.40 mmol) over two steps. After column chromatography (cyclohexane/EtOAc, 10:1) the target product was obtained as a clear oil. Yield: 51 mg (40%). ¹H NMR (300 MHz, CDCl3): δ 7.37−7.13 (m, 5H), 6.16−5.98 (m, 1H), 5.20−5.07 (m, 2H), 4.89/4.88 (qn/dqn, J = 5.9 Hz/J = 11.2 Hz, J = 5.9 Hz, 1H), 4.29−4.19 (m, 1H), 3.74/3.43 (s, 3H). 13C NMR (75 MHz, CDCl3): δ 165.2/164.8 (qn, J = 3.1 Hz/J = 3.5 Hz), 139.7 (qn, J = 1.5 Hz)/ 139.2, 137.9 (qn, J = 1.4 Hz)/135.9, 129.2/129.0, 128.0/127.7, 127.8/ 127.5, 118.6/116.6, 89.3/88.8 (qn, J = 9.2 Hz), 53.2/53.0, 51.8/51.4 $(qn, J = 2.2 \text{ Hz})$. ¹⁹F NMR (282 MHz, CDCl₃): δ 81.8/81.3 (qn, 1F), 67.3/67.1 (dm, J = 146.8 Hz/J = 147.1 Hz). MS-ESI: m/z 339.0456 $[M + Na]^+$ calcd. for $C_{12}H_{13}F_5O_2SNa^+$ 339.0449.

Methyl 3-Phenyl-2-(trifluoromethyl)pent-4-enoates (15b). The diastereomeric target compounds were prepared according to the aforementioned general procedure starting from cinnamyl 3,3,3 trifluoropropanoate (7b) (157 mg, 0.64 mmol) over two steps. After column chromatography (cyclohexane/EtOAc, 10:1) the target product was obtained as a clear oil. Yield: 44 mg (35%). ¹H NMR (300 MHz, CDCl₃): δ 7.37–7.15 (m, 5H), 6.10–5.91 (m, 1H), 5.26– 5.06 (m, 2H), 4.02−3.88 (m, 1H), 3.74/3.43 (s, 3H), 3.61/3.59 (dq, J $= 10.7$ Hz, $J = 7.7$ Hz/ $J = 11.2$ Hz, $J = 7.8$ Hz, 1H). ¹³C NMR (75 MHz, CDCl₃): δ 167.2/166.9 (q, J = 3.5 Hz/J = 3.4 Hz), 139.3/139.2, 136.9, 129.0/129.0, 127.9/127.8, 127.6/127.6, 124.2/124.1 (q, J = 281.5 Hz), 117.6/117.5, 56.0/56.0 (q, J = 25.9 Hz/J = 25.8 Hz), 52.7/ 52.6, 48.9/48.4 (q J = 1.9 Hz/J = 1.5 Hz). ¹⁹F NMR (282 MHz, CDCl₃): δ –64.8/-64.4 (d/dd, J = 7.6 Hz/J = 7.8 Hz, J = 1.3 Hz, 3F). MS-ESI: m/z 281.0767 [M + Na]⁺ calcd. for C₁₃H₁₃F₃O₂Na⁺ 281.0760.

Methyl 2-Methyl-3-phenylpent-4-enoates (15c). The diastereomeric target compounds were prepared according to the aforementioned general procedure starting from cinnamyl propionate (7c) (125 mg, 0.66 mmol) over two steps. After column chromatography (cyclohexane/EtOAc, 10:1) the target product was obtained as a clear oil. Yield: 45 mg (33%). ¹H NMR (400 MHz, CDCl₃): δ 7.34–7.15 $(m, 5H)$, 6.00/5.93 (ddd, J = 17.1, J = 10.3 Hz, J = 8.4 Hz/ J = 17.3, J $= 10.4$ Hz, $J = 9.7$ Hz 1H), $5.13/5.05$ (ddd/dt, $J = 16.9$ Hz, $J = 1.6$ Hz, $J = 0.9$ Hz/J = 10.0 Hz, J = 1.3 Hz, 1H), 5.11/5.01 (dd/ddd, J = 10.0 Hz, $J = 1.5$ Hz/ $J = 10.1$ Hz, $J = 1.6$ Hz, $J = 0.8$ Hz), 3.53–3.40 (m, 1H), 3.68/3.43 (s, 3H), 1.22/0.97 (d, J = 6.9 Hz, 3H). ¹³C NMR (100 MHz, CDCl3): δ 176.2/175.9, 142.4/141.4, 139.9/138.7, 128.9/128.6, 128.2/127.7, 126.9/126.7, 116.9/115.6, 53.9/53.8, 51.6/51.5, 45.4/ 45.1, 16.0/15.7. MS-ESI: m/z 227.1057 [M + Na]⁺ calcd. for $C_{13}H_{16}O_2Na^+$ 227.1043.

Methyl 3-(4-Fluorophenyl)-2-(pentafluorosulfanyl)pent-4 enoates (15d). The diastereomeric target compounds were prepared according to the aforementioned general procedure starting from (E) -3-(4-fluorophenyl)allyl 2-(pentafluorosulfanyl)acetate (7d) (150 mg, 0.47 mmol) over two steps. After column chromatography (cyclohexane/EtOAc, 10:1) the target product was obtained as a clear oil. Yield: 70 mg (45%). ¹ H NMR (300 MHz, CDCl3): δ 7.23−6.94 (m, 4H), 6.13−5.95 (m, 1H), 5.19−5.08 (m, 2H), 4.83/4.82 (qn/dqn, J = 5.8 Hz/J = 11.7 Hz, J = 5.9 Hz, 1H), 4.30−4.19 (m, 1H), 3.75/3.47 (s, 3H). ¹³C NMR (100 MHz, CDCl₃): δ 165.0/164.7 (qn, J = 3.0 Hz/J = 3.2 Hz), 162.1/162.1 (d, J = 247.3 Hz/J = 246.4 Hz), 137.6/135.8, 135.4/135.1, 129.7/129.4 (d, $J = 8.2$ Hz/ $J = 8.1$ Hz), 118.7/116.8, 116.1/115.9 (d, $J = 21.6$ Hz), 89.2/88.8 (qn, $J = 8.9$ Hz), 53.2/53.0, 51.0/50.6 (qn, $J = 2.6$ Hz/ $J = 2.2$ Hz). ¹⁹F NMR (282 MHz, CDCl₃): δ 81.6/81.3 (qn, 1F), 67.4/67.2 (dm, J = 146.8 Hz/J = 147.0 Hz, 4F), $-114.6/-115.3$ (tt, $J = 8.4$ Hz, $J = 5.2$ Hz/ $J = 8.5$ Hz, $J = 5.2$ Hz, 1F). MS-ESI: m/z 357.0367 [M + Na]⁺ calcd. for C₁₂H₁₂F₆O₂SNa⁺ 357.0354.

Methyl 3-(4-Fluorophenyl)-2-(trifluoromethyl)pent-4-enoates (15e). The diastereomeric target compounds were prepared according to the aforementioned general procedure starting from (E)-3-(4 fluorophenyl)allyl 3,3,3-trifluoropropanoate (7e) (150 mg, 0.57 mmol) over two steps. After column chromatography (cyclohexane/ EtOAc, 10:1) the target product was obtained as a clear oil. Yield: 47 mg (30%). ¹ H NMR (300 MHz, CDCl3): δ 7.24−7.12 (m, 2H), 7.07− 6.96 (m, 2H), 6.06−5.89 (m, 1H), 5.22−5.08 (m, 2H), 4.02−3.88 (m, 1H), 3.55/3.55 (dq, $J = 11.2$ Hz, $J = 7.0$ Hz/ $J = 10.6$ Hz, $J = 7.6$ Hz, 1H), 3.76/3.47 (s, 3H). ¹³C NMR (75 MHz, CDCl₃): δ 167.0/166.8 $(q, J = 3.3 \text{ Hz}/ J = 3.5 \text{ Hz})$, 162.1/162.1 $(d, J = 245.9 \text{ Hz}/ J = 246.4$ Hz), 136.6, 135.1/134.9, 129.5 (d, $J = 7.8$ Hz), 124.1/124.0 (q, $J =$ 281.4 Hz/ J = 281.6 Hz), 117.7, 115.9/115.9 (d, J = 21.4 Hz/ J = 21.5 Hz), 56.1 (q, $J = 26.0$ Hz), 52.8/52.6, 48.1/47.6 (q, $J = 1.9$ Hz/ $J = 1.7$ Hz). ¹⁹F NMR (282 MHz, CDCl₃): δ –64.4/-64.9 (dd/d, J = 7.8 Hz, J $= 1.2$ Hz/J = 7.6 Hz, 3F), $-115.2/-115.5$ (tt, J = 8.5 Hz, J = 5.2 Hz/J = 8.6 Hz, J = 5.2 Hz, 1F). MS-ESI: m/z 299.0677 [M + Na]⁺ calcd. for $C_{13}H_{12}F_4O_2Na$ ⁺ 299.0666.

Methyl 2-(Pentafluorosulfanyl)-3-(p-tolyl)pent-3-enoates (15f). The diastereomeric target compounds were prepared according to the aforementioned general procedure starting from (E) -3- $(p$ -tolyl)allyl 2-(pentafluorosulfanyl)acetate (7f) (130 mg, 0.41 mmol) over two steps. After column chromatography (cyclohexane/EtOAc, 10:1) the target product was obtained as a clear oil. Yield: 31 mg (22%). ¹H NMR (500 MHz, CDCl₃): δ 7.17−7.02 (m, 4H), 6.12−6.02 (m, 1H), 5.17−5.05 (m, 2H), 4.88−4.81 (m, 1H), 4.23−4.18 (m, 1H), 3.74/ 3.46 (s, 3H), 2.33/2.30 (s, 3H). ¹³C NMR (125 MHz, CDCl₃): δ 165.2/164.8 (qn, $J = 2.7$ Hz/ $J = 3.6$ Hz), 138.1/136.7, 137.5/137.3, 136.2/136.2, 129.9/129.7, 127.8/127.6, 118.3/116.3, 89.4/88.9 (qn, J = 8.4 Hz/J = 8.9 Hz), 53.1/53.0, 51.5/51.0 (qn, J = 2.4 Hz), 21.2/21.2. ¹⁹F NMR (471 MHz, CDCl₃): δ 82.4/82.0 (qn, 1F), 67.7/67.5 (dm, J $= 147.2$ Hz/J = 146.1 Hz, 4F). MS-ESI: m/z 353.0607 [M + Na]⁺ calcd. for $C_{13}H_{15}F_5O_2SNa^+$ 353.0605.

Methyl 3-(p-Tolyl)-2-(trifluoromethyl)pent-4-enoates (15g). The diastereomeric target compounds were prepared according to the aforementioned general procedure starting from (E) -3- $(p$ -tolyl)allyl 3,3,3-trifluoropropanoate (7g) (130 mg, 0.50 mmol) over two steps. After column chromatography (cyclohexane/EtOAc, 10:1) the target product was obtained as a clear oil. Yield: 30 mg (22%). ¹H NMR $(500 \text{ MHz}, \text{CDCl}_3)$: δ 7.16−7.03 (m, 4H), 6.04−5.93 (m, 1H), 5.20− 5.06 (m, 2H), 3.96−3.87 (m, 1H), 3.76/3.47 (s, 3H), 3.63−3.54 (m, 1H), 2.33/2.31 (s, 3H). 13C NMR (125 MHz, CDCl3): δ 167.2/166.9 $(q, J = 3.3 \text{ Hz} / J = 3.6 \text{ Hz}$, 137.3/137.2, 137.2/137.1, 136.4/136.2, 129.7/129.7, 127.7/127.6, 124.3/124.1 (q, J = 281.5 Hz), 117.3/117.2,

56.1/56.1 (q, J = 25.8 Hz/J = 25.7 Hz), 52.7/52.5, 48.5/48.1 (q, J = 1.8 Hz/J = 1.9 Hz), 21.2/21.2. ¹⁹F NMR (471 MHz, CDCl₃): δ −64.4/-64.8 (dd/d, J = 7.9 Hz, J = 1.3 Hz/J = 7.6 Hz, 3F). MS-ESI: m/z 295.0924 [M + Na]⁺ calcd. for C₁₄H₁₅F₃O₂Na⁺ 295.0916.

General Procedure for Synthesis of Propionic and Trifluoropropionic Acid Allylic Esters. DCC (1.2 equiv) is dissolved in dry DCM (8 mL) before the allylic alcohol (1.2 mmol, 1.0 equiv) and the corresponding carboxylic acid (1.2 equiv) are added under an argon atmosphere. A white precipitate is formed, and a catalytic amount of DMAP is added. The mixture is stirred at rt overnight. The suspension is diluted with $Et₂O$ (25 mL) before the formed urea derivative is filtered off. The remaining solution is washed with H₂O (3×10 mL), 5% acetic acid (3×10 mL), and brine (3×10 mL) and dried over MgSO4 before the solvent is removed under reduced pressure. The crude products are purified by column chromatography (silica gel) as indicated below.

1-Phenylprop-2-en-1-yl 3,3,3-trifluoropropionate (9b). According to the above general procedure 1-phenylprop-2-en-1-ol (170 mg, 1.27 mmol) was reacted with 3,3,3-trifluoropropionic acid. The crude product was purified by column chromatography (cyclohexane/ EtOAc, 5:1) to give the product as a colorless liquid. Yield: 248 mg (80%). ¹H NMR (300 MHz, CDCl₃): δ 3.21 (q, $^{3}J_{\text{H,F}}$ = 10.0 Hz, 2H), 5.21–5.39 (m, 2H), 6.00 (ddd, ${}^{3}J_{\text{H,H}}$ = 16.5 Hz, ${}^{3}J_{\text{H,H}}$ = 10.4 Hz, ${}^{3}J_{\text{H,H}}$ $= 6.0$ Hz, 1H), 6.32 (dt, ${}^{3}J_{H,H} = 6.0$ Hz, ${}^{4}J_{H,H} = 1.3$ Hz, 1H), 7.24–7.44 (m, 5H). ¹³C NMR (75 MHz, CDCl₃): δ 40.0 (qt, ²J_{C,F} = 31.0 Hz), 77.9 (d), 117.8 (t), 123.4 (q, $^{1}J_{C,F} = 276.9$ Hz), 127.3 (d), 128.7 (d), 128.8 (d), 135.4 (d), 138.0 (s), 163.2 (q, ${}^{3}J_{C,F} = 4.2$ Hz). ¹⁹F NMR (282 MHz, CDCl₃): δ –63.3 (t, ³J_{H,F} = 10.1 Hz, 3F). MS-ES(+)-EM: m/z calcd for $C_{12}H_{11}F_3O_2Na^+$ 267.0603; found 267.0610 $[M + Na]$ ⁺. .

1-Phenylprop-2-en-1-yl propionate $(9c)$. According to the above general procedure 1-phenylprop-2-en-1-ol (500 mg, 3.73 mmol) was reacted with propionic acid. The crude product was purified by column chromatography (cyclohexane/EtOAc, 5:1) to give the product as a colorless liquid. Yield: 556 mg (78%). ¹H NMR (400 MHz, CDCl₃): δ 1.15 (t, $^{3}J_{\text{H,H}}$ = 7.6 Hz, 3H), 2.39 (2q, $^{3}J_{\text{H,H}}$ = 7.5 Hz u. $^{3}J_{H,H}$ = 7.6 Hz, 2H), 5.23 (dt, $^{3}J_{H,H}$ = 10.4 Hz, $^{2}J_{H,H}$ = $^{4}J_{H,H}$ = 1.3 Hz, 1H), 5.29 (dt, ³J_{H,H} = 17.1 Hz, ²J_{H,H} = ⁴J_{H,H} = 1.4 Hz, 1H), 6.00 (ddd, ³J = 17.2 H₂, ³J = 10.4 H₂, ³J = 5.9 H₂, 1H), 6.28 (dt, ³J = $J_{\text{H,H}}$ = 17.2 Hz, $^{3}J_{\text{H,H}}$ = 10.4 Hz, $^{3}J_{\text{H,H}}$ = 5.9 Hz, 1H), 6.28 (dt, $^{3}J_{\text{H,H}}$ = 5.9 Hz, ⁴J_{H,H} = 1.4 Hz, 1H), 7.25−7.39 (m, 5H). ¹³C NMR (100 MHz, CDCl3): δ 9.2 (q), 27.9 (t), 76.1 (d), 116.9 (t), 127.2 (d), 128.2 (d), 128.6 (d), 136.5 (d), 139.1 (s), 173.4 (s). The compound was mentioned in the literature, but no spectroscopic data were given.⁴⁰

1-(4-Fluorophenylprop-2-en-1-yl) 3,3,3-trifluoropropionate (9d). According to the above general procedure 1-(4-fluorophenyl)pro[p-2](#page-10-0) en-1-ol (200 mg, 1.31 mmol) was reacted with 3,3,3-trifluoropropionic acid. The crude product was purified by column chromatography (cyclohexane/EtOAc, 10:1) to give a colorless liquid. Yield: 240 mg (70%). ¹H NMR (300 MHz, CDCl₃): δ 3.22 (q, ³J_{H,F} = 10.1 Hz, 2H), 5.30 (dt, ${}^{3}J_{\text{H,H}} = 10.5 \text{ Hz}, {}^{2}J_{\text{H,H}} = {}^{4}J_{\text{H,H}} = 1.2 \text{ Hz}, 1\text{ H}$), 5.32 (dt, ${}^{3}J_{\text{H,H}} =$ 17.2 Hz, $^{2}J_{H,H} = ^{4}J_{H,H} = 1.3$ Hz, 1H), 5.98 (ddd, $^{3}J_{H,H} = 17.1$ Hz, $^{3}J_{H,H}$ = 10.5 Hz, ${}^{3}J_{\text{H,H}}$ = 5.8 Hz, 1H), 6.31 (dt, ${}^{3}J_{\text{H,H}}$ = 5.8 Hz, ${}^{4}J_{\text{H,H}}$ = 1.4 Hz, 1H), 7.00−7.13 (m, 2H), 7.28−7.39 (m, 2H). 13C NMR (75 MHz, CDCl₃): δ 40.0 (qt, ²J_{C,F} = 31.1 Hz), 77.2 (d), 115.8 (dd, ²J_{C,F} = 21.7 Hz), 118.0 (t), 123.4 (q, $^{1}J_{C,F} = 275.3$ Hz), 129.2 (dd, $^{3}J_{C,F} = 8.3$ Hz), 133.8 (d, ${}^{4}J_{C,F}$ = 3.2 Hz), 135.2 (d), 162.8 (d, ${}^{1}J_{C,F}$ = 247.5 Hz), 163.2 $(q, {}^{3}J_{C,F} = 4.3 \text{ Hz}).$ ¹⁹F NMR (282 MHz, CDCl₃): δ –113.1 (tt, ³J_{H,F} = 8.6 Hz, ⁴J_{H,F} = 5.3 Hz, 1F), -63.3 (t, ³J_{H,F} = 10.1 Hz, 3F). MS-ES(+)-EM: m/z calcd for $C_{12}H_{10}F_4O_2Na^+$ 285.0509; found 285.0511 [M + Na ⁺. .

1-(Naphthalenylprop-2-en-1-yl) 3,3,3-trifluoropropionate (9e). According to the above general procedure 1-(naphthalenyl)prop-2 en-1-ol (200 mg, 1.09 mmol) was reacted with 3,3,3-trifluoropropionic acid. The crude product was purified by column chromatography (cyclohexane/EtOAc, 10:1) to give a colorless oil. Yield: 260 mg (81%). ¹H NMR (300 MHz, CDCl₃): δ 3.22 and 3.23 (q, ³J_{H,F} = 10.1 Hz, 2H), 5.32 (dt, ${}^{3}J_{H,H} = 10.4$ Hz, ${}^{2}J_{H,H} = {}^{4}J_{H,H} = 1.2$ Hz, 1H), 5.34 $(\text{dt, }^{3})_{\text{H,H}} = 17.2 \text{ Hz}, \frac{^{2}}{^{5}}_{\text{H,H}} = \frac{^{4}}{^{5}}_{\text{H,H}} = 1.3 \text{ Hz}, 1\text{H}), 6.17 \text{ (ddd, }^{3}\text{J}_{\text{H,H}} =$ 17.1 Hz, ${}^{3}J_{\text{H,H}} = 10.5 \text{ Hz}$, ${}^{3}J_{\text{H,H}} = 5.4 \text{ Hz}$, 1H), 7.04 (dt, ${}^{3}J_{\text{H,H}} = 5.5 \text{ Hz}$,
 ${}^{4}I = 1.5 \text{ Hz}$, 1H), 7.40–7.63 (m, 4H), 7.76–7.93 (m, 3H), 8.02– 4 J_{H,H} = 1.5 Hz, 1H), 7.40−7.63 (m, 4H), 7.76−7.93 (m, 2H), 8.02− 8.16 (m, 1H). ¹³C NMR (75 MHz, CDCl₃): δ 40.0 (qt, ²J_{C,F} = 31.0

Hz), 75.5 (d), 118.2 (t), 123.5 (q, $^{1}J_{C,F}$ = 276.2 Hz), 123.7 (d), 125.4 (d), 125.7 (d), 126.0 (d), 126.6 (d), 129.0 (d), 129.5 (d), 130.6 (s), 133.6 (s), 134.0 (s), 135.1 (d), 163.3 (q, ${}^{3}J_{C,F} = 4.3$ Hz). ¹⁹F NMR (282 MHz, CDCl₃): δ –63.2 (t, ³J_{H,F} = 10.1 Hz, 3F). MS-ES(+)-EM: m/z calcd for $C_{16}H_{13}F_3O_2Na^+$ 317.0760; found 317.0759 [M + Na]⁺. .

1-(4-Fluorophenylprop-2-en-1-yl) Propionate (9f). According to the above general procedure 1-(4-fluorophenyl)prop-2-en-1-ol (200 mg, 1.31 mmol) was reacted with propionic acid. The crude product was purified by column chromatography (cyclohexane/EtOAc, 10:1) to give a colorless liquid. Yield: 225 mg (82%). ¹H NMR (300 MHz, CDCl₃): δ 1.15 (t, ³J_{H,H} = 7.6 Hz 3H), 2.38 and 2.39 (q, ³J_{H,H} = 7.5 Hz and ${}^{3}J_{\text{H,H}}$ = 7.6 Hz, 2H), 5.25 (dt, ${}^{3}J_{\text{H,H}}$ = 10.4 Hz, ${}^{2}J_{\text{H,H}}$ = ${}^{4}J_{\text{H,H}}$ = 1.3 Hz, 1H), 5.28 (dt, ${}^{3}J_{\text{H,H}} = 17.1 \text{ Hz}$, ${}^{2}J_{\text{H,H}} = {}^{4}J_{\text{H,H}} = 1.4 \text{ Hz}$, 1H), 5.98 $\left(\frac{\text{ddd}}{3} \right)_{\text{H,H}} = 17.2 \text{ Hz}^{3} \left(\frac{3}{1 \text{ H}} \right)_{\text{H,H}} = 10.4 \text{ Hz}^{3} \left(\frac{3}{1 \text{ H}} \right) = 5.7 \text{ Hz}^{3} \left(\text{H} \right)_{\text{H}} = 5.7 \text{ Hz}^{3} \left(\text{H} \right)_{\text{H}} = 5.9 \text{ Hz}^{3} \left(\text{m} \right)_{\text{H}} = 1.4 \text{ Hz}^{3} \left(\text{H} \right)_{\text{H}} = 5.7 \text{ Hz$ $J_{\text{H,H}}$ = 5.9 Hz, $^{4}J_{\text{H,H}}$ = 1.4 Hz, 1H), 6.98–7.09 (m, 2H), 7.29–7.37 (m, 2H). ¹³C NMR (75 MHz, CDCl₃): δ 9.2 (q), 27.9 (t), 75.3 (d), 115.5 (dd, ${}^{2}J_{C,F} = 21.5$ Hz), 117.0 (t), 129.1 (dd, ${}^{3}J_{C,F} = 8.2$ Hz), 135.0 (d, ${}^{4}I_{C} = 3.2$ Hz), 136.3 (d), 162.6 (d, ${}^{1}I_{C} = 246.6$ Hz), 173.4 (s), ${}^{19}F$ $J_{\text{C,F}}$ = 3.2 Hz), 136.3 (d), 162.6 (d, $^{1}J_{\text{C,F}}$ = 246.6 Hz), 173.4 (s). ¹⁹F NMR (282 MHz, CDCl₃): δ –114.0 (tt, ³J_{H,F} = 8.6 Hz, ⁴J_{H,F} = 5.3 Hz, 1F). MS-ES(+)-EM: m/z calcd for $C_{12}H_{13}FO_2Na^+$ 231.0792; found 231.0794 $[M + Na]$ ⁺. .

(1-Naphthalenylprop-2-en-1-yl) Propionate (9g). According to the above general procedure 1-(naphthalenyl)prop-2-en-1-ol (200 mg, 1.09 mmol) was reacted with propionic acid. The crude product was purified by column chromatography (cyclohexane/EtOAc, 10:1) to give a colorless oil. Yield: 221 mg (84%) . ¹H NMR $(400$ MHz, CDCl₃): δ 1.15 (t, ${}^{3}J_{H,H}$ = 7.6 Hz, 3H), 2.40 and 2.42 (q, ${}^{3}J_{H,H}$ = 7.5 Hz or $^3J_{\text{H,H}}$ = 7.6 Hz, 2H), 5.27 (dt, $^3J_{\text{H,H}}$ = 10.6 Hz, $^2J_{\text{H,H}}$ = $^4J_{\text{H,H}}$ = 1.3 Hz, 1H), 5.30 (dt, ${}^{3}J_{\text{H,H}} = 17.3$ Hz, ${}^{2}J_{\text{H,H}} = {}^{4}J_{\text{H,H}} = 1.4$ Hz, 1H), 6.18 $\left(\frac{\text{ddd}}{3} \right)_{\text{H,H}} = 17.1 \text{ Hz}^{3} \left(\frac{3}{1 \text{ H,H}} \right) = 10.5 \text{ Hz}^{3} \left(\frac{3}{1 \text{ H,H}} \right) = 5.3 \text{ Hz}$, 1H), 7.00 $\left(\text{dt}\right)$
 $\frac{3}{1 \text{ H}} = 5.4 \text{ Hz}^{4} \left(\text{m} - 1.7 \text{ Hz} \right) = 17.4 \left(\text{m} - 3.4 \text{ Hz} \right) = 7.56 - 7.61 \text{ (m)}$ $J_{\text{H,H}}$ = 5.4 Hz, $^{4}J_{\text{H,H}}$ = 1.7 Hz, 1H), 7.42–7.54 (m, 3H), 7.56–7.61 (m, 1H), 7.77−7.88 (m, 2H), 8.10−8.16 (m, 1H). 13C NMR (100 MHz, CDCl3): δ 9.2 (q), 27.9 (t), 73.5 (d), 117.2 (t), 123.9 (d), 125.4 (d), 125.5 (d), 125.8 (d), 126.4 (d), 128.9 (d), 129.1 (d), 130.8 (s), 134.0 (s), 134.7 (s), 136.1 (d), 173.5 (s). MS-ES(+)-EM: m/z calcd for $C_{16}H_{16}O_2$ Na⁺ 263.1043; found 263.1050 [M + Na]⁺. .

Ireland−Claisen rearrangement of 1-Arylprop-2-en-1-yl Propionates: General Procedure. In an oven-dried Schlenk vessel, the respective ester (0.5 mmol, 1.0 equiv) is dissolved in dry THF (5 mL) and cooled to −78 °C. Then LDA (1.8 M solution in THF/ heptane/ethylbenzene, 2.5 equiv) is added dropwise under stirring. The mixture is stirred at this temperature for 10 min before TMSCl (1.2 equiv) is added. Stirring is continued overnight, while the solution is allowed to warm up to rt. The mixture is diluted with diethyl ether (15 mL), 2 M HCl (7.5 mL) is added, and stirring at r.t. is continued for 3 h. The phases are separated, and the aqueous phase is extracted with diethyl ether $(3 \times 15 \text{ mL})$. The combined organic layers are washed with 2 M HCl (15 mL) and brine (15 mL) and dried over magnesium sulfate. The solvent is removed under reduced pressure. The crude carboxylic acid is dissolved in DMF (20 mL), and potassium carbonate (1.5 mmol) is added. Methyl iodide (2.0 equiv) is added, and the suspension is stirred at 0 °C for 3 h. After warming to r.t., water (100 mL) is added, and the aqueous phase is extracted with ethyl acetate $(3 \times 50 \text{ mL})$. The combined organic phase is washed with saturated bicarbonate solution (50 mL) and brine (50 mL). The organic solution is dried over magnesium sulfate, and the solvent is removed under reduced pressure. The crude product is purified by column chromatography.

Methyl (E)-2-Methyl-5-phenylpent-4-en-yl-carboxylate $(10c)^{41}$ According to the general procedure 1-(phenylpent-2-en-1-yl) propionate (9c) (50 mg, 0.26 mmol) was transformed to the produ[ct,](#page-10-0) which was purified by column chromatography (pentane/diethyl ether, 10:1) to be isolated as a colorless liquid. Yield: 19 mg (28%, over two steps). ¹H NMR (300 MHz, CDCl₃): δ 1.20 (d, ³J_{H,H} = 6.8 Hz, 3H), 2.29−2.49 (m, 1H), 2.51−2.66 (m, 2H), 3.68 (s, 3H), 6.14 (ddd, ³J_{H,H} = 15.7 Hz, ${}^{3}J_{H,H}$ = 7.4 Hz, ${}^{3}J_{H,H}$ = 6.8 Hz, 1H), 6.42 (d, ${}^{3}J_{H,H}$ = 15.9 Hz, 1H), 7.17−7.23 (m, 1H), 7.26−7.37 (m, 4H). 13C NMR (75 MHz, CDCl₃): δ 16.8 (q), 37.2 (t), 39.7 (d), 51.8 (q), 126.2 (d), 127.3 (d), 127.3 (d), 128.6 (d), 132.3 (d), 137.5 (s), 176.7 (s). MS-ES(+)-

EM: m/z calcd for $C_{13}H_{16}O_2Na^+$ 227.1043; found 227.1050 [M + Na ⁺. .

Methyl (E)-2-Methyl-5-(4-fluorophenyl)pent-4-en-yl-carboxylate (10f). According to the general procedure 1-(4-fluorophenylpent-2 en-1-yl) propionate (9f) (150 mg, 0.72 mmol) was transformed to the product, which was purified by column chromatography (pentane/ diethyl ether, 10:1) to be isolated as a colorless liquid. Yield: 52 mg (32%, over two steps). ¹H NMR (300 MHz, CDCl₃): δ 1.20 (d, ³J_{H,H} = 6.8 Hz, 3H), 2.25−2.41 (m, 1H), 2.48−2.68 (m, 2H), 3.68 (s, 3H), 6.05 (dt, ${}^{3}J_{\text{H,H}} = 15.7 \text{ Hz}$, ${}^{3}J_{\text{H,H}} = {}^{3}J_{\text{H,H}} = 7.0 \text{ Hz}$, 1H), 6.38 (d, ${}^{3}J_{\text{H,H}} =$ 16.0 Hz, 1H), 6.90−7.03 (m, 2H), 7.23−7.36 (m, 2H). 13C NMR (75 MHz, CDCl₃): δ 37.1 (t), 39.7 (d), 51.8 (q), 115.5 (dd, ²J_{C,F} = 21.5 Hz), 127.0 (dd, ${}^{6}J_{\text{C,F}} = 2.3$ Hz), 127.6 (dd, ${}^{5}J_{\text{C,F}} = 8.0$ Hz), 131.0 (d), 133.6 (d, ${}^4J_{C,F} = 3.3$ Hz), 162.2 (d, ${}^1J_{C,F} = 246.0$ Hz), 176.6 (s). ¹⁹F NMR (282 MHz, CDCl₃): δ –115.3 (tt, ³J_{H,F} = 8.6 Hz, ⁴J_{H,F} = 5.4 Hz, 1F). MS-ES(+)-EM: m/z calcd for $C_{13}H_{15}FO_2Na^+$ 245.0948; found 245.0953 $[M + Na]$ ⁺. .

Methyl (E)-2-Methyl-5-(naphthalene-1-yl)pent-4-en-yl-carboxylate (10g). According to the general procedure 1-[(naphthalene-1yl)pent-2-en-1-yl] propionate (9g) (150 mg, 0.62 mmol) was transformed to the product, which was purified by column chromatography (pentane/diethyl ether, 10:1) to be isolated as a colorless liquid. Yield: 100 mg (63%, over two steps). ¹H NMR (300 MHz, CDCl₃): δ 1.26 (d, 3 J_{H,H} = 6.7 Hz, 3H), 2.39–2.53 (m, 1H), 2.59−2.76 (m, 2H), 3.69 (s, 3H), 6.14 (dt, ${}^{3}H_{\text{H,H}} = 15.5 \text{ Hz}$, ${}^{3}H_{\text{H,H}} = 71 \text{ Hz}$, 1H) 7.15 (d, ${}^{3}I_{\text{H}} = 15.2 \text{ Hz}$, 1H) 7.35−7.60 (m, 4H) $J_{\text{H,H}}$ = 7.1 Hz, 1H), 7.15 (d, $^{3}J_{\text{H,H}}$ = 15.2 Hz, 1H), 7.35–7.60 (m, 4H), 7.69−7.90 (m, 2H), 8.01−8.16 (m, 1H). ¹³C NMR (75 MHz, CDCl₃): δ 16.9 (q), 37.6 (t), 39.8 (d), 51.8 (q), 123.9 (d), 124.0 (d), 125.7 (d), 125.8 (d), 126.0 (d), 127.7 (d), 128.6 (d), 129.6 (d), 130.6 (d), 131.2 (s), 133.7 (s), 135.4 (s), 176.6 (s). MS-ES(+)-EM: m/z calcd for $C_{17}H_{18}O_2Na^+$ 277.1199; found 277.1198 $[M + Na]^+$. .
