S Supporting Information

[AB](#page-12-0)STRACT: [Biakamides A](#page-12-0)−D, novel unusually unique polyketides, were isolated from an Indonesian marine sponge (Petrosaspongia sp.) with a constructed bioassay using PANC-1 human pancreatic cancer cells. Through detailed analyses of the one- and two-dimensional NMR spectra of biakamides, planar chemical structures possessing a terminal thiazole, two N-methyl amides, a chloromethylene, and a substituted butyryl moiety were obtained. After elucidation of the configuration of the secondary alcohol moiety in biakamides A and B, the absolute stereostructures of the two secondary methyl groups in biakamides A−D were determined by the asymmetric total syntheses of all possible stereoisomers from the optically pure monoprotected 2,4-dimethyl-1,5-diol. Biakamides A−D showed

selective antiproliferative activities against PANC-1 cells cultured under glucose-deficient conditions in a concentrationdependent manner. The primary mode of action of biakamides was found to be inhibition of complex I in the mitochondrial electron transport chain.

■ INTRODUCTION

The microenvironment surrounding tumors is an important target for anticancer drug discovery. Because of the disordered vascular network, solid tumors have large areas exhibiting hypoxia and/or nutrient starvation. $\frac{1}{1}$ Cancer cells are known to acquire tolerance toward such severe conditions, allowing them to survive. Furthermore, these [c](#page-12-0)ancer cells also acquire resistance to cancer chemotherapy and irradiation and aggravate the pathology of cancer by promoting tumor growth and metastasis.² Therefore, compounds that exhibit selective growth inhibitory activity against tumor cells adapted to the tumor microen[v](#page-12-0)ironment may be novel, promising anticancer drugs and important chemical tools for identification of new molecule(s) responsible for the adaptation of tumor cells to hypoxia and nutrient starvation.

Marine natural products have been shown to be a rich and promising source of drug candidates, particularly in the field of anticancer drug discovery. $3,4$ During our assessment of bioactive substances from marine organisms, we focused on searching for compounds targeting the [tu](#page-12-0)mor microenvironment. From our studies, we identified several active compounds such as furospinosulin-1⁵ and dictyoceratin, 6 which show hypoxiaselective growth inhibitory activity against cancer cells. Further, we also conduc[te](#page-12-0)d synthetic studies [an](#page-12-0)d target analyses of the

identified compounds to validate their potential as anticancer drugs. $7-11$

In contrast, some reports described the search for selective growt[h in](#page-12-0)hibitors against cancer cells adapted to nutrient starvation conditions. According to the so-called "anti-austerity" strategy, $12,13$ several active compounds, including kigamycin D and arctigenin, were identified from microbial secondary metabol[ites](#page-12-0) or traditional herbal medicines.14−¹⁷ However, the adaptation system of cancer cells to nutrient deprivation has not been fully elucidated. Recently, we als[o](#page-12-0) [est](#page-12-0)ablished a screening system to search for substances that selectively inhibit the growth of PANC-1 human pancreatic cancer cells cultured under glucose-deficient conditions and isolated a new 3 alkylpyridine alkaloid (N-methylniphatyne A) and 3,4,5 tribromo-2-(2′,4′-dibromophenoxy)-phenol as active substances through bioassay-guided separation.^{18,19} Further screening of the extract library of marine organisms led us to isolate unique polyketides named biakamides [A](#page-12-0)[−](#page-12-0)D (1−4) from an Indonesian marine sponge (Petrosaspongia sp.).

Here, we report the isolation, structure elucidation, total synthesis, and biological evaluation of biakamides A−D (Figure 1).

■ RESULTS AND DISCUSSION

Isolation and Structure Elucidation of Biakamides A− D. The MeOH extract (240 g) of the marine sponge Petrosaspongia sp. (05A01), collected in Biak, Indonesia in 2005, showed selective growth inhibitory activity against PANC-1 cells cultured in glucose-deficient medium. The MeOH extract was partitioned into an H_2O and AcOEt mixture, and the AcOEt soluble portion was further partitioned into an n-hexane and 90% methanol mixture. Using the bioassay, the active 90% methanol soluble portion (34 g) was fractionated by successive silica gel column chromatography and reversed-phase HPLC to yield four active constituents, designated biakamides A (1, 2.8 mg), B (2, 1.4 mg), C (3, 6 mg), and D (4, 6 mg).

The MALDI-TOF MS results for 1 showed pseudomolecular ion peaks at m/z 534 and 536 [M + Na]⁺ with a ratio of 3:1. These data suggested that there may be a chlorine atom within this molecule. The molecular formula of 1 was determined to be $C_{26}H_{42}O_3N_3SCl$ by high-resolution (HR) MALDI-TOF MS, indicating that this compound possesses seven double bond equivalents. Many signals in the $^{\mathrm{I}}\mathrm{H}$ and $^{13}\mathrm{C}$ NMR spectra of 1 were anomalously broadened, irrespective of solvent, and some others were observed as doubled signals (Figure 2). Brief

analyses of the two-dimensional (2D) NMR spectra indicated that two N-methylamide moieties were contained in the molecule, implying the presence of distinguishable cis/trans rotamers. Thus, structure elucidation of 1 was executed using the NMR signals of the respective conformers as described below (Table 1).

Analyses of the 13 C NMR and HSQC spectra of 1 revealed that this molecule consisted of six methyls (four aliphatic and two nitrogen-substituted), eight methylenes (six aliphatic and

two heteroatom-substituted), seven methines (two aliphatic, one oxymethine, and four olefinic), and five quaternary carbons (two olefinic and three possible carbonyls). Detailed analyses of some 2D NMR spectra (COSY, HSQC, and HMBC) of 1 demonstrated the presence of seven partial structures A−G (Figure 3). The characteristic 2-substituted thiazole structure (partial structure A) has been found in some marine-derived

Figure 3. Partial structures and 2D NMR correlations of 1.

metabolites such as barbamide or dysideathiazole.^{20,21} The chloromethylene moiety in the partial structure E was deduced from the HMBC correlations between H-16/C-8, C-[9, an](#page-12-0)d C-10 and from a comparison of the chemical shifts of the sp2 carbons with those of malyngamides and jamaicamides. $22,23$ Furthermore, the HMBC between H-13 and C-1, together with an exceptionally upfield-shifted vinylic proton²⁴ (H-3, δ_H 5[.42](#page-12-0)[\),](#page-13-0) indicated that the two partial structures B and C were connected to form a N-methylated $α, β$ -unsat[ura](#page-13-0)ted amide. The HMBCs between H-22, H-26/C-21, and H-26/C-12 led us to deduce the connectivities of another terminal (structures E− G). Some pairs of the distinguishable NMR signals corresponding to this region were observed probably because of the presence of the two conformers (ratio of approximately 3:2) for the N-methylamide group at C-21. The NOESY correlation between H-22 and H-26 was observed in the spectrum of the major trans-conformer of this N-methyl amide moiety, whereas the H-22/H-12 NOESY correlation was observed in the minor cis-conformer.

In contrast, no correlation signals around the partial structure D were observed in the HMBC and H−H COSY spectra of 1. Most $^1\mathrm{H}$ and $^{13}\mathrm{C}$ NMR signals corresponding to the left half of the molecule were exceptionally broadened probably because of the presence of a large energy barrier of bond rotation around the N-methylamide group. Therefore, we anticipated that an elevated temperature would accelerate bond rotation to yield averaged and sharpened NMR signals. As expected, the $^1\mathrm{H}$ NMR spectrum of 1 measured at 50 °C in DMSO- d_6 gave somewhat sharpened signals. Under this condition, the magnetization relay (from H-15 to H-4, H-5, H-7, and H-8) was observed in the total correlation spectroscopy (TOCSY) results. Furthermore, the HMBCs between H-15/C-5 and C-7 were observed under these conditions, providing evidence for the connectivities between the partial structures C, D, and E. The geometries of the two olefins $({\Delta}^2$ and ${\Delta}^{9(16)}$) were determined as E from the NOESY correlations among H-13/H-4, H-16/H-10, and H-11. Finally, the absolute configuration of the secondary alcohol moiety at C-23 was found to be S by applying the modified Mosher method²⁵ (Figure 4, Supporting

Figure 4. Selected NOEs and modified Mosher analysis of 1.

Information). In this way, most of the chemical structure of 1, except for configurations of the two secondary methyls at C-4 [and C-6, cou](http://pubs.acs.org/doi/suppl/10.1021/acs.joc.6b02948/suppl_file/jo6b02948_si_001.pdf)ld be determined, as depicted in Figure 4.

From the HR-MALDI-TOF MS analysis, the molecular formula of 2 was found to be the same as that of 1. The onedimensional (1D) and 2D NMR analyses revealed that 2 possesses almost the same planar structure as 1 except for the geometry of the chloromethylene moiety, in which the NOESY correlations between H-16/H-7 and H-8 were observed to define the geometry of the $\Delta^{9(16)}$ olefin as Z (Figure 5).

Figure 5. Planar structures and selected NOEs of 2, 3, and 4.

The molecular formula of 3 was determined to be $C_{27}H_{42}O_3N_3SCl$ by HR-MALDI-TOF MS. Initial attempts to determine the structure of 3 revealed that many signals in the $H¹H NMR$ spectrum of 3 were further broadened compared with those of 1. Additionally, compound 3 was unstable and gradually changed to another compound during prolonged NMR measurement in CDCl₃ solvent. Considering the acid lability of 3 , the CDCl₃ that passed through basic alumina just before preparation of the NMR sample was used to suppress its decomposition. Then, the chemical structure of 3 could be deduced by detailed analysis of the 2D NMR spectrum, which was similar to that of 1, except that a methoxy group (δ_H 3.60) and an olefinic proton (δ _H 5.15) were observed in the terminal acyl moiety. Through analysis of HMBCs (H-22/C-21 and C-23, H-24/C-22 and C-23, and H-27/C-23), as depicted in Figure 5, 3 was found to possess a 3-methoxy-2-butenoyl moiety at its terminal. Some reported metabolites such as ajudazole 26 also had the same functionality. Furthermore, the geometry of the Δ^{22} olefin in 3 was determined as E from NOE experime[nts](#page-13-0). Additionally, 4 was assigned as the geometrical counterpart of 3 at the $\Delta^{9(16)}$ chloromethylene moiety (Figure 5).

Total Syntheses of 1−4. Finally, we aimed to determine the relative/absolute stereostructures of the two secondary methyl groups at C-4 and C-6 for ¹−⁴ . As described above, the ¹ ¹H NMR signals at the C-4 through C-7 positions in the biakamides were too broadened, and we could not apply empirical methods^{27,28} to analyze the differences in ¹H NMR chemical shifts. Accordingly, we decided to carry out the total synthesis of 1−4 t[o de](#page-13-0)termine the absolute stereostructures of these moieties and generate sufficient amounts of the compounds for further biological analyses.

An outline of our synthetic plan is depicted in Figure 6. To obtain all possible stereoisomers of 1−4, we planned to use the monoprotected 2,4-dimethyl-1,5-pentanediol as [a chiral](#page-3-0) synthon, which can be obtained in an optically pure form through the known enzymatic desymmetrization and kinetic resolution of the syn- and anti-isomers, respectively.²⁹ The central polyketide skeleton II can be prepared through the Corey-Seebach coupling reaction³⁰ between the 1,3[-di](#page-13-0)thiane III and the nitrogen-contained alkyl halide, and the following successive introduction of [th](#page-13-0)e unsaturated amide and chloromethylene moieties was expected to provide the common precursor I of biakamides. The final acylation using the corresponding carboxylic acid would afford 1−4.

Figure 6. Retrosynthesis of biakamides.

Initially, the syntheses of 3 and 4 were carried out as shown in Scheme 1 because the structure determination process for 3 and 4 was expected to be simpler. The (R,R) -2,4-dimethyl-1,5pentanediol $((-)-5)$ was prepared by the known enzymatic optical resolution method 29 using lipase AK. According to a

recent report, 31 monoprotection of the two hydroxyl groups of (−)-5 as tert-butyldiphenylsilyl (TBDPS) ether was achieved in acceptable y[iel](#page-13-0)d. Subsequent one-pot TEMPO oxidation/ Wittig reaction 32 proceeded smoothly to give an unsaturated ester (7). The double bond of 7 was reduced by treatment with magnesium in [M](#page-13-0)eOH, and the subsequent hydrolysis of the resulting ester (8) provided a carboxylic acid (9). Then, 9 was converted into the corresponding Weinreb amide (10), which was reduced with DIBAL to give an aldehyde (11). Treatment of 11 with 1,3-propanedithiol and a catalytic amount of iodine³³ gave a 1,3-dithiane (12), the designated precursor III of the central fragment. As expected, the Corey-Seebach coupli[ng](#page-13-0) reaction between a carbanion generated by the n-BuLi treatment of 12 and an alkyl iodide (21) ,³⁴ followed by TBAF treatment, afforded the desired compound (13) in good yield. TPAP oxidation of the liberated primar[y](#page-13-0) alcohol of 13 gave an aldehyde (14), and the subsequent Wittig homologation with a stabilized ylide yielded an α , β -unsaturated ester (15). The concomitant Z-isomer was separated by $SiO₂$ column chromatography. Subsequent hydrolysis of the ester moiety with NaOH or KOH in aqueous methanol or 1,4-dioxane was found to be very sluggish, whereas TMSOK treatment³⁵ resulted in decomposition. Gratifyingly, hydrolysis with LiOH proceeded efficiently to provide a carboxylic acid (16) in go[od](#page-13-0) yield. Epimerization at C-4, the γ-position of the unsaturated ester moiety, did not occur during hydrolysis. Subsequent condensation with a secondary amine $(22)^{36}$ yielded an Nmethylamide (17). We found that almost all of the signals in the ¹H NMR spectrum of the amide 17 bro[ade](#page-13-0)ned exceptionally, whereas the normal and sharp signals were observed in the ¹H NMR spectrum of 16. These data clearly indicated that the presence of the unsaturated N-methylamide moiety interrupted free bond rotation. Iodine treatment of 17 under basic

conditions resulted in clean removal of 1,3-dithiane to give a ketone (18), and subsequent introduction of a chloromethylene moiety was quantitatively proceeded to give 19 through the Wittig reaction using (chloromethyl)triphenylphosphonium chloride $(E/Z = 3:2)$. Finally, removal of the Boc moiety by TFA treatment and subsequent condensation with a known (E)-3-methoxy-2-butenoic acid $(23)^{37}$ afforded $(4R,6S)$ -3 and -4. These two compounds were separated by reversed-phase HPLC under the established condit[ion](#page-13-0)s.

According to the synthetic route described above, (4R,6R) biakamides C $(3')$ and D $(4')$ were synthesized starting from (2S,4R)-2,4-dimethyl-1,5-pentanediol 5-TBDPS ether (6′) (Scheme 2).³⁸ Each reaction proceeded without any problems,

resulting in comparable yields. A comparison of the ¹H NMR spectra of these compounds revealed that the ¹H signals of the natural 3 showed good accordance with those of the (4R,6S) isomer, whereas some discrepancies were observed with those of the (4R,6R)-isomer, typically at H-6 and H-7 signals (Figure 7). Furthermore, the specific rotation ($[\alpha]_{\text{D}} = -17.2$) of the (4R,6S)-isomer matched well with that ($[\alpha]_D = -18.0$) of the natural 3. Similar results were obtained in the case of 4 (data not shown). Therefore, the absolute stereostructures of both 3 and 4 were unambiguously determined to be (4R,6S), as shown in Figure 1.

Figure 7. Comparison of $^1\mathrm{H}$ NMR spectra of natural 3 and synthetic 3 or 3′.

Next, the synthesis of 1 and 2 was also investigated. The 23S configuration for these two compounds was determined as described above. However, a comparison of the NMR spectra and specific rotations between the four synthetic stereoisomers $[(4R,6S)$ -, $(4S,6R)$ -, $(4S,6S)$ -, and $(4R,6R)$ -] and the natural 1 and 2 is needed to finalize this stereochemical analysis.

In the same manner as described above, the (4S,6R)- and (4S,6S)-isomers of the amine 20 were synthesized starting from the (2S,4S)- or (2R,4S)-congeners of the 2,4-dimethyl-1,5 pentanediol 5-TBDPS ether, respectively. Condensation between commercially available (S)-3-hydroxybutyric acid and the respective isomer of the amine 20 proceeded without problem, and subsequent HPLC separation afforded all possible stereoisomers of 1 and 2 (Scheme 3).

Next, we compared the NMR spectra and specific rotations of the four diastereomers with those of the natural 1 (Figure 8). The potential (4S,6S) and (4R,6R) configurations were easily excluded by considering the obvious differences in th[e chemica](#page-5-0)l shifts of the ¹ H NMR signals at H-6 and H-7 between the isomers and the natural $\overline{1}$ (Figure 8A). In contrast, the $^1\mathrm{H}$ NMR spectra of the (4S,6R)- and (4R,6S)-isomers were found to be similar to each ot[her thro](#page-5-0)ughout the molecule. Fortunately, only the multiplicity of the signals at H-12 of the (4S,6R)-isomer was different from that of the (4R,6S) isomer and the natural 1 (Figure 8B). In addition, the specific rotation of the natural 1 ($[\alpha]_D$ = +6.3) was similar to that of the (4R,6S)-isomer ($[\alpha]_D$ = +[1.2\), whe](#page-5-0)reas a large value ($[\alpha]_D$ = +33.4) was observed in the case of the (4S,6R)-isomer.

Furthermore, crucial evidence was obtained from a comparison of the CD spectra of these compounds. Thus, the CD spectrum of the (4S,6R)-isomer showed a positive maximum at 210 nm derived from the α , β -unsaturated amide moiety, whereas both the (4R,6S)-isomer and natural 1 showed a negative maximum (Figure 9). Similar data were obtained in the case of 2 (data not shown). Thus, the absolute stereochemistry of both 1 and 2 was found to be (4R,6S), which was similar to t[hat](#page-5-0) [of](#page-5-0) 3 and 4.

Figure 8. Comparison of ${}^{1}\mathrm{H}$ NMR spectra of natural 1 and the four synthetic isomers of 1.

Figure 9. Comparison of CD spectra of natural 1 and synthetic $(4R, 6S)$ -1 and $(4S, 6R)$ -1.

Bioactivity of 1−4. 1−4 exhibited selective antiproliferative activity against PANC-1 cells cultured under glucose-deficient conditions in a concentration-dependent manner (Table 2). Among the four compounds, 3 and 4 showed more potent activity, with a half-maximal inhibitory concentration (IC_{50}) of 0.5 μ M. Additionally, when used at a concentration of less than 30 μ M, these biakamides showed almost no toxicity against

PANC-1 cells cultured in normal medium containing 25 mM glucose. These data indicated that these biakamides may be promising anticancer drugs and that the anticancer effects of these compounds were realized by the targeting of cancer cells adapted to a glucose-deficient microenvironment.

Next, we performed a mechanistic analysis of biakamides. Recent studies have revealed that cancer cells adapt to nutrient starvation by activating the phosphoinositol 3-kinase (PI3K)/ Akt/mammalian target of rapamycin (mTOR) signaling pathway and the unfolded protein response (UPR), such as induction of glucose-regulated protein 78 (GRP78). Moreover, inhibitors of mitochondrial function or GRP78 are known to exhibit selective growth-inhibitory activity against cancer cells cultured under glucose-deprived conditions.^{39,40} Indeed, we recently revealed that 3,4,5-tribromo-2-(2′,4′-dibromophenoxy)-phenols exhibit antiproliferative activit[y](#page-13-0) [aga](#page-13-0)inst PANC-1 cells cultured under glucose-starved conditions through weak inhibition of Akt phosphorylation and GRP78 expression. We clarified that the antiproliferative activity of this compound may be mediated by inhibition of complex II in the mitochondrial electron transport chain.¹⁹ We then analyzed the effect of biakamides on these signaling pathways or mitochondrial function using Western [b](#page-12-0)lotting and MitoCheck Complex Activity Assays (Cayman Chemical).

Western blot analysis revealed that Akt phosphorylation and GRP78 expression were induced in PANC-1 cells cultured in glucose-deficient medium in comparison with those cultured in general glucose medium (Figure 10, lanes 1 and 2).

Figure 10. Effect of 3 on the Akt signaling and induction of GRP78 by Western blot analysis. The PANC-1 cells cultured in the glucosedeficient medium (glucose (−)) or general glucose medium (glucose (+)) were treated with 3 or antimycin A. Cell lysate was resolved using SDS-PAGE and detected with antibodies against the indicated proteins.

Additionally, 3 weakly inhibited Akt phosphorylation and GRP78 expression in PANC-1 cells cultured in glucosedeficient medium (lanes 5 and 6). A similar phenomenon was observed for antimycin A, a known antiausterity agent that inhibits complex III in the mitochondrial electron transport chain (lanes 3 and 4).

Furthermore, we found that 3 selectively inhibited complex I in the mitochondrial electron transport chain, with an IC_{50} of 0.45 μ M. This inhibitory concentration was similar to the IC₅₀ of the antiproliferative activity of 3 against PANC-1 cells cultured under glucose-deficient conditions, as shown in Table 3. We also found that rotenone, a known inhibitor of complex I, also exhibited selective growth inhibitory activity against PANC-1 cells cultured under glucose-deficient conditions and showed inhibitory properties similar to those observed for Akt and GRP78 (Figure S1, Supporting Information). These results strongly implied that 3 showed selective growth inhibitory activity against cance[r cells adapted to gl](http://pubs.acs.org/doi/suppl/10.1021/acs.joc.6b02948/suppl_file/jo6b02948_si_001.pdf)ucose-deficient conditions through inhibition of complex I in the mitochondrial electron transport chain.

■ CONCLUSION

On the basis of the constructed bioassay, we isolated four novel polyketides, designated 1−4, from the Indonesian marine sponge (Petrosaspongia sp.) as selective growth inhibitors against the PANC-1 human pancreatic cancer cells cultured under glucose-deprived conditions. The unique chemical structures of these compounds could be unambiguously elucidated by spectral analyses and the asymmetric total syntheses of all possible stereoisomers.

The primary mode of action of biakamides was found to be inhibition of complex I in the mitochondrial electron transport chain. Further biological evaluation, including in vivo studies,

mechanistic analyses, and structure−activity relationship studies using the synthetic analogues, is now underway.

EXPERIMENTAL SECTION

General Experimental. The following instruments were used to obtain physical data: a JASCO P-2200 digital polarimeter $(L = 50 \text{ mm})$ for specific rotations; a JEOL ECS-300 (¹H NMR: 300 MHz, ¹³C NMR: 75 MHz), ECA-500 (1 H NMR: 500 MHz, 13C NMR: 125 MHz), and an Agilent NMR system (¹H NMR: 600 MHz, ¹³C NMR: 150 MHz) spectrometer for ${}^{1}H$ and ${}^{13}C$ NMR data using tetramethylsilane as an internal standard; a JASCO FT/IR-5300 infrared spectrometer for IR spectra; a JEOL JMS-S3000 mass spectrometer for MALDI-TOF MS; and a Waters Q-Tof Ultima API mass spectrometer for ESI-TOF MS. Silica gel (Kanto, 40–100 μ m) and precoated TLC plates (Merck, $60F_{254}$) were used for column chromatography and TLC. Spots on TLC plates were detected by spraying acidic p-anisaldehyde solution (p-anisaldehyde: 25 mL, c-H2SO4: 25 mL, AcOH: 5 mL, EtOH: 425 mL) or phosphomolybdic acid solution (phosphomolybdic acid: 25 g, EtOH: 500 mL) with subsequent heating. Unless otherwise noted, the entire reaction was performed under a N_2 atmosphere. After workup, the organic layer was dried over Na₂SO₄.

Extraction and Isolation of Active Compounds. The dried marine sponge of Petrosaspongia sp. (2.4 kg), which was collected in 2005 in Biak, Indonesia, was extracted with MeOH. On the guidance of bioassay, the MeOH extract (240 g, IC_{50} (glucose-deficient medium) = 50 μ g/mL, IC₅₀ (general glucose medium) = >100 μ g/ mL) was partitioned into a water:EtOAc mixture (1:1). The active EtOAc soluble portion was further partitioned into a hexane:90% MeOH mixture (1:1). The active 90% MeOH soluble portion [34 g, IC_{50} (glucose-deficient medium) = 10 μ g/mL, IC₅₀ (general glucose medium) = >30 μ g/mL] was fractionated by SiO₂ gel column chromatography $[CHCl₃$ -MeOH-H₂O (lower phase)] to give 6 fractions (Fr. 1–6). The active Fr. 2 [6.3 g, IC₅₀ (glucose-deficient medium) = 5 μ g/mL, IC₅₀ (general glucose medium) = 30 μ g/mL] was fractionated by $SiO₂$ gel column chromatography [CHCl₃-MeOH-H2O (lower phase)] to give 6 fractions (Fr. 2-1 through 2-6). The active Fr. 2-5 was then further purified by ODS HPLC (Cosmosil MS-II, $CH_3CN:H_2O = 55:45$) to obtain 6 fractions (Fr. 2-5-1 through 2-5-6). The results of bioassay showed that Fr. 2-5-2 and 2-5-4 exhibited cytotoxic activity against PANC-1 cells in the glucose-deficient medium selectively. Then, the Fr. 2-5-2 (7.4 mg) was then further purified by ODS HPLC (Cosmosil MS-II, MeOH: $H_2O = 6:4$) to afford biakamide A $(1, 2.8 \text{ mg})$ and biakamide B $(2, 1.4 \text{ mg})$. Fr. 2-5-4 (21.1 mg) was then further purified by ODS HPLC (Cosmosil MS-II, MeOH: $H_2O = 7:3$) to afford biakamide C (3, 6.1 mg) and biakamide D (4, 6.3 mg).

1: Colorless Amorphous Powder. $[\alpha]_D^{20}$ +6.3 (c = 0.22, CHCl₃). MALDI-TOF-MS m/z : 534 [M + Na]⁺. HR-MALDI-TOF-MS: Calcd for $C_{26}H_{42}N_3O_3SCN$ a 534.25276. Found 534.25333. Preparation of (S) - or (R) -MTPA Ester of 1 and 2. (S) - or (R) -MTPA (20 equiv), DMAP (5 equiv), and DCC (20 equiv) were added to a solution of 1 or 2 i[n](http://pubs.acs.org/doi/suppl/10.1021/acs.joc.6b02948/suppl_file/jo6b02948_si_001.pdf) [THF,](http://pubs.acs.org/doi/suppl/10.1021/acs.joc.6b02948/suppl_file/jo6b02948_si_001.pdf) [an](http://pubs.acs.org/doi/suppl/10.1021/acs.joc.6b02948/suppl_file/jo6b02948_si_001.pdf)d the whole mixture was stirred for 4 days. Sat. Na $HCO₃$ aq. was added to the mixture, and the whole mixture was extracted with AcOEt. Removal of the solvent from AcOEt extract under reduced pressure gave a crude product which was purified by SiO_2 column [hexane:AcOEt = 1:1 \rightarrow CHCl₃:MeOH:H₂O = 30:3:1 (lower phase)] and by reversed-phase HPLC (Cosmosil $5C_{18}$ -MS-II, 10 mm i.d. \times 250 mm, CH₃CN:H₂O = 55:45 \rightarrow 70:30 \rightarrow 80:20, flow rate =4.0 mL/min, detection $UV = 240$ nm) to give the corresponding MTPA esters.

(S)-MTPA Ester of 1. ${}^{1}H$ NMR (600 MHz, CDCl₃: only key resonances of the major conformer are listed): δ 5.64 (1H, m, H-23), 2.93 (3H, s, H-26), 2.78, 2.44 (total 2H, m, H-22), 1.37 (3H, d, J = 6.2 Hz, H-24).

(R)-MTPA Ester of 1. 1 H NMR (600 MHz, CDCl₃: only key resonances of the major conformer are listed): δ 5.63 (1H, m, H-23), 2.87 (3H, s, H-26), 2.74, 2.41 (total 2H, m, H-22), 1.45 (3H, d, J = 6.3 Hz, H-24). HR-ESI-TOF-MS: Calcd for $C_{36}H_{49}N_3O_5F_3NaSCl$ 750.2931. Found 750.2968.

(S)-MTPA Ester of 2. 1 H NMR (600 MHz, CDCl₃: only key resonances of the major conformer are listed): δ 5.64 (1H, m, H-23), 2.95 (3H, s, H-26), 2.78, 2.44 (total 2H, m, H-22), 1.37 (3H, d, J = 6.2 Hz, H-24). HR-ESI-TOF-MS: Calcd for $C_{36}H_{49}N_3O_5F_3NaSCl$ 750.2931. Found 750.2968.

(R)-MTPA Ester of 2. 1 H NMR (600 MHz, CDCl₃: only key resonances of the major conformer are listed): δ 5.64 (1H, m, H-23), 2.89 (3H, s, H-26), 2.75, 2.42 (total 2H, m, H-22), 1.45 (3H, d, J = 6.3 Hz, H-24). HR-ESI-TOF-MS: Calcd for $C_{36}H_{49}N_3O_5F_3NaSCl$ 750.2931. Found 750.2978.

Total Synthesis of Biakamides A−D. (2R,4R)-2,4-Dimethylpentane-1,5-diol (5). The compound was obtained through the reported method.²⁹ The optical purity was confirmed by NMR measurement of the corresponding $bis(R)$ -MTPA ester.

(2R,4[R\)](#page-13-0)-5-((tert-Butyldiphenylsilyl)oxy)-2,4-dimethylpentan-1-ol **(6).** Et₃N (575 μ L, 4.1 mmol, 1.2 equiv) and TBDPSCl (894 μ L, 3.4 mmol, 1.0 equiv) were added to a solution of 5 (454.4 mg, 3.4 mmol) in $CH₃CN:hexane (3:1, 34 mL)$, and the whole mixture was stirred for 19 h at rt. Sat. Na $HCO₃$ aq. was added to the mixture, and the whole mixture was extracted with AcOEt. Removal of the solvent from AcOEt extract under reduced pressure gave a crude product which was purified by $SiO₂$ column (hexane:AcOEt = 5:1 to 1:1) to give 6 (636) mg, 50%) as a colorless oil. The spectroscopic and physical data were identical to those reported.⁴¹

Methyl (4R,6R,E)-7-((tert-Butyldiphenylsilyl)oxy)-4,6-dimethylhept-2-enoate (7). Iodob[en](#page-13-0)zene diacetate (1.22 g, 2.8 mmol, 2.3 equiv) and TEMPO (25.6 mg, 0.17 mmol, 0.1 equiv) were added to a solution of 7 (607 mg, 1.6 mmol) in CH_2Cl_2 (20 mL), and the whole mixture was stirred for 3 h at rt. Then, toluene (30 mL) and methyl 2- (triphenyl-λ⁵-phosphanylidene)acetate (658 mg, 2.0 mmol, 1.2 equiv) were added to the mixture, and the whole mixture was stirred for 28 h at 100 °C. $\text{Na}_2\text{S}_2\text{O}_3/\text{NaHCO}_3$ aq. was added to the mixture, and the whole mixture was extracted with AcOEt. The AcOEt extract was successively washed with sat. $NH₄Cl$ aq., $NaHCO₃$ aq., and brine. Removal of the solvent from the AcOEt extract under reduced pressure gave a crude product which was purified by $SiO₂$ column (hexane:AcOEt = 15:1) to give 7 (571 mg, 82%) as a colorless oil.

 $[\alpha]_{\text{D}}^{26}$ –21.9 (c = 1.17, CHCl₃). ¹H NMR (600 MHz, CDCl₃) δ : 7.66 (4H, t, J = 6.5 Hz), 7.45−7.38 (6H, m), 6.86 (1H, dd, J = 15.8, 7.9 Hz), 5.71 (1H, d, J = 15.8 Hz), 3.73 (3H, s), 3.50 (1H, dd, J = 9.7, 5.2 Hz), 3.44 (1H, dd, $J = 9.7$, 6.1 Hz), 2.32 (1H, quint, $J = 7.0$ Hz), 1.69 (1H, q-like, $J = 6.3$ Hz), 1.46 (1H, dt, $J = 13.7$, 6.9 Hz), 1.18 (1H, dt, J = 13.7, 7.1 Hz), 1.06 (9H, s), 0.99 (3H, d, J = 6.5 Hz), 0.92 (3H, d, J = 6.8 Hz). ¹³C NMR (150 MHz, CDCl₃) δ : 167.4, 155.3, 135.62 (2C), 135.60 (2C), 133.9, 133.8, 129.6 (2C), 127.6 (4C), 119.0, 68.4, 51.4, 39.5, 34.1, 33.2, 26.9 (3C), 19.5, 19.3, 17.3. IR (KBr): 2957, 1725, 1657, 1429, 1111 cm⁻¹. MS (ESI-TOF) m/z: 447 [M + Na]⁺ . HRMS (ESI-TOF) m/z : 447.2331 calcd for C₂₆H₃₆O₃SiNa; found: 447.2321.

Methyl (4S,6R)-7-((tert-Butyldiphenylsilyl)oxy)-4,6-dimethylheptanoate (8). Magnesium (160 mg, 6.6 mmol, 5.0 equiv) was added to a solution of 7 (557 mg, 1.3 mmol) in MeOH (10 mL), and the whole mixture was stirred for 1 h at rt. Sat. NH₄Cl aq. was added to the mixture; the whole mixture was extracted with AcOEt, and the AcOEt extract was washed with sat. $NH₄Cl$ aq. and brine. Removal of the solvent from the AcOEt extract under reduced pressure gave a crude product which was purified by $SiO₂$ column (hexane:AcOEt = 10:1) to give 8 (559 mg, quant.) as a colorless oil.

 $[\alpha]_{D}^{27}$ +9.5 (c = 1.39, CHCl₃). ¹H NMR (600 MHz, CDCl₃) δ : 7.67 (4H, d, J = 6.7 Hz), 7.44−7.37 (6H, m), 3.66 (3H, s), 3.47 (1H, dd, J = 9.7, 5.9 Hz), 3.43 (1H, dd, J = 9.7, 6.2 Hz), 2.35−2.23 (2H, m), 1.76−1.71 (1H, m), 1.62−1.57 (1H, m), 1.50−1.42 (2H, m), 1.24− 1.20 (1H, m), 1.06 (9H, s), 1.06−1.02 (1H, m), 0.88 (3H, d, J = 6.7 Hz), 0.84 (3H, d, J = 6.1 Hz). ¹³C NMR (150 MHz, CDCl₃) δ : 174.5, 135.6 (4C), 134.04, 134.03, 129.5 (2C), 127.6 (4C), 69.4, 51.5, 40.3, 33.1, 32.7, 31.9, 29.7, 26.9 (3C), 19.3, 19.1, 16.6. IR (KBr): 2956, 1740, 1428, 1111 cm⁻¹. MS (ESI-TOF) m/z: 449 [M + Na]⁺. HRMS (ESI-TOF) m/z : 449.2488 calcd for $C_{26}H_{38}O_3SiNa$; found: 449.2486.

(4S,6R)-7-((tert-Butyldiphenylsilyl)oxy)-4,6-dimethylheptanoic Acid (9). LiOH (153 mg, 6.6 mmol, 5.0 equiv) was added to a solution of 8 (543 mg, 1.3 mmol) in MeOH (10 mL), and the whole mixture was stirred for 7 h at rt. HCl (5%) was added to the mixture, and the whole mixture was extracted with AcOEt. Removal of the solvent from the AcOEt extract under reduced pressure gave a crude product which was purified by $SiO₂$ column (hexane:AcOEt = 2:1) to give 9 (504 mg, 96%) as a colorless oil.

 $[\alpha]_{\text{D}}^{26}$ +9.9 (c = 0.37, CHCl₃). ¹H NMR (600 MHz, CDCl₃) δ : 7.66 (4H, d, J = 6.8 Hz), 7.43−7.36 (6H, m), 3.47 (1H, dd, J = 9.7, 5.9 Hz), 3.43 (1H, dd, J = 9.7, 6.3 Hz), 2.38−2.27 (2H, m), 1.76−1.70 (1H, m), 1.63−1.58 (1H, m), 1.50−1.42 (2H, m), 1.25−1.20 (1H, m), 1.06 (9H, s), 1.06−1.02 (1H, m), 0.88 (3H, d, J = 6.8 Hz), 0.84 (3H, d, J = 6.2 Hz). ¹³C NMR (150 MHz, CDCl₃) δ : 179.5, 135.6 (4C), 134.0 (2C), 129.5 (2C), 127.6 (4C), 69.4, 40.3, 33.1, 32.4, 31.6, 29.6, 26.9 (3C), 19.3, 19.0, 16.6. IR (KBr): 3300, 2858, 1709, 1428, 1111 cm⁻¹. MS (ESI-TOF) m/z: 435 [M + Na]⁺. HRMS (ESI-TOF) m/z: 435.2331 calcd for $C_{25}H_{36}O_3SiNa$; found: 435.2340.

(4S,6R)-7-((tert-Butyldiphenylsilyl)oxy)-4,6-dimethylheptanal (11). HOBt (229 mg, 1.7 mmol, 1.4 equiv), MeONHMe·HCl (165 mg, 1.7 mmol, 1.4 equiv), Et_3N (0.85 mL, 6.1 mmol, 5.0 equiv), and EDCI·HCl (325 mg, 1.7 mmol, 1.4 equiv) were added to a solution of **9** (499 mg, 1.2 mmol) in CH_2Cl_2 (20 mL), and the whole mixture was stirred for 3 h at rt. Sat. NH_4Cl aq. was added to the mixture; the whole mixture was extracted with AcOEt, and the AcOEt extract was washed with sat. $NH₄Cl$ aq., NaHCO₃ aq., and brine. Removal of the solvent from the AcOEt extract under reduced pressure gave crude Weinreb amide 10, which was used in the next reaction without further purification. The crude 10 was dissolved in anhydrous THF (12 mL). DIBAL-H solution (1.0 M in THF, 1.4 mL, 1.4 mmol, 1.2 equiv) was added to the solution at 0 $^{\circ}$ C, and the whole mixture was stirred for 1 h at 0 $^{\circ}$ C. Sat. NH₄Cl aq. was added to the mixture; the whole mixture was extracted with AcOEt, and the AcOEt extract was washed with sat. NH4Cl aq. and brine. Removal of the solvent from the AcOEt extract gave a crude product which was purified by $SiO₂$ column (hexane: $ACOEt = 12:1$) to give 11 (226 mg, 0.58 mmol, 49%) as a colorless oil.

 $[\alpha]_{D}^{26}$ +10.1 (c = 1.79, CHCl₃). ¹H NMR (600 MHz, CDCl₃) δ : 9.76 (1H, s), 7.68 (4H, d, J = 7.0 Hz), 7.44−7.38 (6H, m), 3.49 (1H, dd, J = 9.7, 5.9 Hz), 3.45 (1H, dd, J = 9.7, 6.5 Hz), 2.46–2.35 (2H, m), 1.78−1.72 (1H, m), 1.64−1.57 (1H, m), 1.52−1.42 (2H, m), 1.28− 1.23 (1H, m), 1.07 (9H, s), 1.06−1.03 (1H, m), 0.90 (3H, d, $J = 6.8$ Hz), 0.85 (3H, d, J = 6.5 Hz). ¹³C NMR (150 MHz, CDCl₃) δ : 202.9, 135.5 (4C), 133.9 (2C), 129.4 (2C), 127.5 (4C), 69.3, 41.6, 40.3, 33.0, 29.5 (2C), 26.8 (3C), 19.2, 19.0, 16.5. IR (KBr): 2958, 1727, 1428, 1111 cm⁻¹. MS (ESI-TOF) m/z: 419 [M + Na]⁺. HRMS (ESI-TOF) m/z : 419.2382 calcd for C₂₅H₃₆O₂SiNa; found: 419.2368.

(((2R,4S)-6-(1,3-Dithian-2-yl)-2,4-dimethylhexyl)oxy)(tert-butyl) diphenylsilane (12). 1,3-Propanedithiol (76 μ L, 0.74 mmol, 1.3 equiv) and iodine (14.5 mg, 0.06 mmol, 0.10 equiv) were added to a solution of 11 (226 mg, 0.57 mmol) in CHCl₃ (10 mL), and the whole mixture was stirred for 1.3 h at rt. $\text{Na}_2\text{S}_2\text{O}_3/\text{NaHCO}_3$ aq. was added to the mixture, and the whole mixture was extracted with CHCl₃. Removal of the solvent from the CHCl₃ extract under reduced pressure gave a crude product which was purified by $SiO₂$ column (hexane:AcOEt = 12:1) to give 12 (249 mg, 90%) as a colorless oil.

 $[\alpha]_{\text{D}}^{26}$ +6.8 (c = 1.02, CHCl₃). ¹H NMR (600 MHz, CDCl₃) δ : 7.69 (4H, d, J = 6.8 Hz), 7.45–7.38 (6H, m), 4.02 (1H, t, J = 6.9 Hz), 3.50 (1H, dd, J = 9.7, 5.8 Hz), 3.45 (1H, dd, J = 9.7, 6.5 Hz), 2.91− 2.81 (4H, m), 2.13−2.10 (1H, m), 1.90−1.83 (1H, m), 1.80−1.69 (3H, m), 1.52−1.47 (2H, m), 1.37−1.32 (1H, m), 1.28−1.22 (1H, m), 1.09 (9H, s), 1.07−1.03 (1H, m), 0.91 (3H, d, J = 6.8 Hz), 0.85 (3H, d, J = 6.4 Hz). ¹³C NMR (150 MHz, CDCl₃) δ : 135.6 (4C), 133.9 (2C), 129.4 (2C), 127.5 (4C), 69.4, 48.0, 40.4, 34.6, 33.1, 33.0, 30.5, 30.4, 29.8, 26.8 (3C), 26.0, 19.30, 19.26, 16.7. IR (KBr): 2929, 1426, 1108 cm⁻¹. MS (ESI-TOF) m/z: 509 [M + Na]⁺. HRMS (ESI-TOF) m/z : 509.2344 calcd for C₂₈H₄₂OSiS₂Na; found: 509.2339.

tert-Butyl (3-(2-((3S,5R)-6-Hydroxy-3,5-dimethylhexyl)-1,3-dithian-2-yl)propyl)(methyl)carbamate (13). n-BuLi (1.59 M in n-hexane, 770 μ L, 0.77 mmol, 1.5 equiv) was added to a solution of 12 (249 mg, 0.51 mmol) in anhydrous THF (10 mL), and the whole mixture was stirred for 15 min. A solution of 21 (557 mg, 1.4 mmol, 2.7 equiv) in anhydrous THF (5 mL) was added dropwise to the mixture via cannula over 5 min at rt, and the whole mixture was stirred for 0.5 h at rt. Sat. NH4Cl aq. was added to the mixture; the whole mixture was extracted with AcOEt, and the AcOEt extract was washed with NH₄Cl aq. and brine. After removal of the solvent from AcOEt extract under reduced pressure, the residue was dissolved in THF (10 mL). TBAF solution (1 M in THF, 3.0 mL) was added to the solution at rt, and the whole mixture was stirred for 8 h at rt. Sat. $NH₄Cl$ aq. was added to the mixture; the whole mixture was extracted with AcOEt, and the AcOEt extract was washed with $NH₄Cl$ aq. and brine. Removal of the solvent from the AcOEt extract under reduced pressure gave a crude product which was purified by $SiO₂$ column (hexane:AcOEt = 3:1 to 1:1) to give 13 (131 mg, 61%) as a colorless oil.

 $[\alpha]_{\text{D}}^{2\overline{6}}$ +7.6 (c = 0.41, CHCl₃). ¹H NMR (600 MHz, CDCl₃) δ : 3.47 (1H, dd, J = 10.3, 5.9 Hz), 3.41−3.34 (1H, m), 3.28−3.17 (2H, m), 2.89 (3H, s), 2.79 (4H, d-like, J = 5.6 Hz), 1.95−1.90 (2H, m), 1.89−1.75 (4H, m), 1.74−1.65 (2H, m), 1.65−1.60 (2H, m), 1.53− 1.45 (1H, m), 1.45 (9H, s), 1.45−1.38 (1H, m), 1.30−1.22 (1H, m), 1.20−1.14 (1H, m), 1.12−1.07 (1H, m), 0.88 (3H, d, J = 6.5 Hz), 0.87 $(3H, d, J = 5.8 \text{ Hz})$. ¹³C NMR (150 MHz, CDCl₃) δ : 155.8, 79.3, 68.8, 53.0, 48.5, 40.6, 35.7, 34.7, 34.2, 33.2, 31.6, 30.2, 28.5 (3C), 25.99, 25.98, 25.5, 22.7, 19.5, 16.5. IR (KBr): 3467, 2928, 1693, 1365, 1151 cm⁻¹. MS (ESI-TOF) m/z: 442 [M + Na]⁺. HRMS (ESI-TOF) m/z: 442.2426 calcd for $C_{21}H_{41}NO_3S_2Na$; found: 442.2416.

tert-Butyl (3-(2-((3S,5R)-3,5-Dimethyl-6-oxohexyl)-1,3-dithian-2 yl)propyl)(methyl)carbamate (14). MS4A (130 mg) and NMO (51.1 mg, 0.44 mmol, 1.5 equiv) were added to a solution of 13 (118 mg, 0.29 mmol) in CH_2Cl_2 (5 mL), and the whole mixture was stirred for 15 min at rt. Then, TPAP (5.1 mg, 0.015 mmol, 0.05 equiv) was added to the mixture, and the solution was stirred for 1 h at rt. $Na₂S₂O₃/NaHCO₃$ aq. and sat. CuSO₄ aq. were added to the mixture, and the whole mixture was extracted with CH_2Cl_2 . Removal of the solvent from the CH_2Cl_2 extract under reduced pressure gave a crude product which was purified by SiO_2 column (hexane:AcOEt = 3:1) to give 14 (93 mg, 79%) as a colorless oil.

 $[\alpha]_{\text{D}}^{27}$ –4.1 (c = 0.39, CHCl₃). ¹H NMR (600 MHz, CDCl₃) δ : 9.60 (1H, d, J = 1.8 Hz), 3.23 (2H, br), 2.85 (3H, br s), 2.79 (4H, br), 2.43 (1H, q-like, J = 6.5 Hz), 1.95−1.90 (2H, m), 1.89−1.78 (4H, m), 1.67−1.61 (2H, m), 1.57−1.53 (1H, m), 1.52−1.45 (2H, m), 1.45 $(9H, s)$, 1.31–1.26 (2H, m), 1.07 (3H, d, J = 6.7 Hz), 0.91 (3H, d, J = 6.2 Hz). ¹³C NMR (150 MHz, CDCl₃) δ : 205.2, 155.8, 79.3, 52.9, 48.7, 48.0, 44.2, 37.4, 35.8, 34.9, 34.1, 31.2, 30.5, 28.5 (3C), 26.0 (2C), 25.4, 22.8, 19.3, 13.4. IR (KBr): 2931, 1723, 1693, 1394, 1148 cm[−]¹ . MS (ESI-TOF) m/z : 440 [M + Na]⁺. HRMS (ESI-TOF) m/z : 440.2269 calcd for $C_{21}H_{39}NO_3S_2Na$; found: 440.2252.

Ethyl (4R,6S,E)-8-(2-(3-((tert-Butoxycarbonyl)(methyl)amino) propyl)-1,3-dithian-2-yl)-2,4,6-trimethyloct-2-enoate (15). (Carbetoxyethylidene)triphenylphosphorane (302 mg, 0.84 mmol, 4.0 equiv) was added to the solution of 14 (87 mg, 0.21 mmol) in toluene (8 mL), and the whole mixture stirred for 44 h at 100 °C. Sat. NH4Cl aq. was added to the mixture; the whole mixture was extracted with AcOEt, and the AcOEt extract was washed with $NH₄Cl$ aq. and brine. Removal of the solvent from the AcOEt extract under reduced pressure gave a crude product which was purified by $SiO₂$ column (hexane: $ACOEt = 10:1$ to 1:1) to give 15 (110 mg, quant.) as a colorless oil.

 $[\alpha]_{\text{D}}^{27}$ –20.3 (c = 0.89, CHCl₃). ¹H NMR (600 MHz, CDCl₃) δ : 6.52 (1H, d, J = 9.1 Hz), 4.17 (2H, q, J = 7.2 Hz), 3.23 (2H, br), 2.88– 2.75 (7H, br), 2.63−2.58 (1H, m), 1.95−1.90 (2H, br), 1.87−1.70 (2H, m), 1.84 (3H, d, J = 1.1 Hz), 1.67−1.61 (2H, m), 1.57−1.53 (1H, m), 1.52−1.45 (2H, m), 1.45 (9H, s), 1.41−1.15 (5H, m), 1.29 (3H, t, J = 7.2 Hz), 0.96 (3H, d, J = 6.4 Hz), 0.88 (3H, d, J = 6.4 Hz). 13 C NMR (150 MHz, CDCl₃) δ : 168.5, 155.8, 148.1, 126.0, 79.3, 60.4, 53.0, 48.8, 47.9, 44.1, 35.6, 34.9, 34.7, 34.1, 30.7 (2C), 30.5, 28.5 (3C), 25.97, 25.95, 25.4, 22.8, 22.5, 20.1, 19.9, 14.3, 12.5. IR (KBr): 2927, 1697, 1365, 1149 cm⁻¹. MS (ESI-TOF) m/z: 524 [M + Na]⁺. HRMS (ESI-TOF) m/z : 524.2844 calcd for $C_{26}H_{47}NO_4S_2Na$; found: 524.2848.

(4R,6S,E)-8-(2-(3-((tert-Butoxycarbonyl)(methyl)amino)propyl)- 1,3-dithian-2-yl)-2,4,6-trimethyloct-2-enoic Acid (16). LiOH (48 mg, 2.0 mmol, 10 equiv) was added to a solution of 15 (100 mg, 0.2 mmol) in THF:MeOH:H₂O $(1:1:1, 12 \text{ mL})$, and the whole mixture was stirred for 24 h at rt. HCl (5%) was added to the mixture, and the whole mixture was extracted with AcOEt. Removal of the solvent from the AcOEt extract under reduced pressure gave a crude product which was purified by $SiO₂$ column (hexane:AcOEt = 1:1) to give 16 (72.6)

mg, 77%) as a colorless oil.
¹H NMR (600 MHz, CDCl₃) δ: 6.67 (1H, d, J = 8.9 Hz), 3.23 (2H, br), 2.88−2.75 (7H, br), 2.68−2.60 (1H, m), 1.95−1.90 (2H, br), 1.87−1.70 (3H, m), 1.86 (3H, s), 1.67−1.61 (2H, m), 1.52−1.45 (1H, m), 1.46 (9H, s), 1.41−1.15 (5H, m), 0.99 (3H, d, J = 6.7 Hz), 0.89 $(3H, d, J = 6.1 Hz)$. IR (KBr) : 3200 (br), 2962, 1696, 1261, 1030 cm⁻¹. MS (ESI-TOF) m/z: 496 [M + Na]⁺. HRMS (ESI-TOF) m/z: 496.2531 calcd for $C_{24}H_{43}NO_4S_2Na$; found: 496.2552.

tert-Butyl Methyl(3-(2-((3S,5R,E)-3,5,7-trimethyl-8-(methyl- (thiazol-2-ylmethyl)amino)-8-oxooct-6-en-1-yl)-1,3-dithian-2-yl) propyl)carbamate (17). HOBt (35.8 mg, 0.27 mmol, 1.4 equiv), Nmethyl-1-(thiazol-2-yl)methanamine (36.4 mg, 0.28 mmol, 1.5 equiv), Et₃N (148 μL, 1.06 mmol, 4.0 equiv), and EDCI·HCl (50.8 mg, 0.27 mmol, 1.4 equiv) were added to a solution of 16 (72.6 mg, 0.19 mmol) in CH_2Cl_2 (15 mL), and the whole mixture was stirred for 48 h at rt. Sat. $NH₄Cl$ aq. was added to the mixture; the whole mixture was extracted with AcOEt, and the AcOEt extract was washed with Sat. $NH₄Cl$ aq., NaHCO₃ aq., and brine. Removal of the solvent from the AcOEt extract under reduced pressure gave a crude product which was purified by SiO_2 column (hexane:AcOEt = 1:2) to give 17 (86.1 mg, 92%) as a colorless oil.

 $[\alpha]_{\text{D}}^{27}$ –24.7 ($c = 0.43$, CHCl₃). Mixture of rotamers. ¹H NMR (600 MHz, CDCl₃) δ : 7.66 (1H, br s), 7.28 (1H, d, J = 2.6 Hz), 5.33 (1H, br), 4.82 (2H, s), 3.16 (2H, br), 2.98 (3H, br s), 2.80−2.76 (7H, br), 2.55−2.48 (1H, m), 1.95−1.50 (8H, m), 1.83 (3H, d, J = 1.1 Hz), 1.48−1.00 (5H, m), 1.39 (9H, s), 0.88 (3H, br), 0.81 (3H, br). 13C NMR (150 MHz, CDCl₃) δ: 173.4, 166.6, 155.6, 141.9, 138.2, 128.8, 119.9, 119.5, 79.1, 60.2, 52.9, 52.8, 48.6, 48.2, 47.7, 44.2, 36.8, 35.5, 34.7, 34.5, 33.9, 30.6, 30.3, 30.2, 29.6, 28.3 (3C), 25.8 (2C), 25.2, 22.6, 22.3, 20.0, 19.9, 14.1. IR (KBr): 2926, 1692, 1632, 1393, 1147 cm⁻¹. . MS (ESI-TOF) m/z : 606 [M + Na]⁺. HRMS (ESI-TOF) m/z : 606.2834 calcd for $C_{29}H_{49}N_3O_3S_3N_4$; found: 606.2857.

tert-Butyl Methyl((7S,9R,E)-7,9,11-trimethyl-12-(methyl(thiazol-2 ylmethyl)amino)-4,12-dioxododec-10-en-1-yl)carbamate (18). Iodine (142 mg, 0.56 mmol, 4 equiv) was added to a solution of 17 $(81.4 \text{ mg}, 0.14 \text{ mmol})$ in a mixture of CH₃CN (6 mL) and sat. NaHCO₃ aq. (3 mL) at 0 °C, and the whole mixture was stirred for 1.3 h at 0 °C. $\text{Na}_2\text{S}_2\text{O}_3/\text{NaHCO}_3$ aq. was added to the mixture, and the whole mixture was extracted with AcOEt, and the AcOEt extract was washed with $\text{Na}_2\text{S}_2\text{O}_3/\text{NaHCO}_3$ aq. and brine. Removal of the solvent from the AcOEt extract under reduced pressure gave a crude product which was purified by $SiO₂$ column (hexane:AcOEt = 1:3 to 0:1) to give 18 (32.6 mg, 47%) as a colorless oil.

 $[\alpha]_{D}^{27}$ –16.2 ($c = 1.11$, CHCl₃). Mixture of rotamers. ¹H NMR (600 MHz, CDCl₃) δ : 7.57 (1H, br s), 7.21 (1H, d, J = 3.0 Hz), 5.26 (1H, br), 4.73 (2H, s), 3.06 (2H, t-like), 2.89 (3H, br s), 2.67 (3H, br s), 2.43−2.38 (1H, m), 2.30−2.15 (2H, m), 2.25 (2H, t, J = 7.0 Hz), 1.73 (3H, br s), 1.62 (2H, quint, J = 7.0 Hz), 1.52−1.44 (1H, br), 1.30 (9H, s), 1.20−0.90 (3H, m), 0.79 (3H, br), 0.69 (3H, br). 13C NMR $(150 \text{ MHz}, \text{CDCl}_3)$ δ: 210.0, 209.7, 173.2, 166.4, 155.5, 155.3, 141.8, 137.9, 128.6, 119.7, 78.9, 78.8, 52.3, 48.0, 47.7, 47.2, 43.9, 39.9, 39.1, 39.0, 36.6, 33.6, 29.9, 29.7, 29.3, 28.0, 21.5, 21.1, 19.7, 19.3, 13.9. IR (KBr): 2926, 1692, 1632, 1393, 1169 cm[−]¹ . MS (ESI-TOF) m/z: 516 $[M + Na]$ ⁺. HRMS (ESI-TOF) m/z : 516.2872 calcd for $C_{26}H_{43}N_3O_4SNa$; found: 516.2887.

tert-Butyl ((4EZ,7S,9R,10E)-4-(Chloromethylene)-7,9,11-trimethyl-12-(methyl(thiazol-2-ylmethyl)amino)-12-oxododec-10-en-1-yl)- (methyl)carbamate (19). LHMDS solution (1.0 M in THF, 320 μ L, 0.32 mmol, 4.8 equiv) was added to a solution of (chloromethyl) triphenylphosphonium chloride (114 mg, 0.33 mmol, 5.0 equiv) in anhydrous THF (3 mL), and the whole mixture was stirred for 10 min. A solution of 18 (32.6 mg, 0.066 mmol) in anhydrous THF (1 mL) was added dropwise to the mixture via cannula over 5 min at rt, and the whole mixture was stirred for 1 h at rt. Sat. $NH₄Cl$ aq. was added to the mixture; the whole mixture was extracted with AcOEt, and the AcOEt extract was washed with NH4Cl aq. and brine. Removal of the solvent from AcOEt extract under reduced pressure gave a crude product which was purified by $SiO₂$ column (hexane:AcOEt = 1:2) to give 19 (34.5 mg, 99%) as a colorless oil.

 E/Z mixture (E/Z = 3:2). ¹H NMR (600 MHz, CDCl₃) δ: 7.72 (1H, br s), 7.32 (1H, d, $J = 3.0$ Hz), 5.77 (1H, br s), 5.41 (1H, br), 4.87 (2H, s), 3.18 (2H, br), 3.03 (3H, br s), 2.83 (3H, br), 2.60−2.50 (1H, m), 2.20−2.05 (2H, m), 2.04−1.92 (2H, m), 1.87 (0.6 × 3H, s), 1.86 (0.4 × 3H, s), 1.73 (1H, br), 1.64−1.56 (2H, m), 1.443 (0.4 × 9H, s), 1.440 (0.6 × 9H, s), 1.44−1.10 (4H, m), 0.93 (3H, br), 0.88 $(0.6 \times 3H, br), 0.85 (0.4 \times 3H, br).$ ¹³C NMR (150 MHz, CDCl₃) δ : 173.7, 166.9, 155.8, 155.7, 142.2, 138.4, 128.86, 128.82, 120.1, 112.2, 79.3, 79.2, 48.8, 48.5, 48.2, 48.1, 44.18, 44.16, 37.0, 34.9, 34.2, 33.9, 32.3, 32.0, 30.6, 30.2, 29.84, 29.80, 28.5, 27.6, 27.5, 25.8, 25.6, 25.5, 25.0, 20.0, 19.9, 19.8, 19.7, 14.3. IR (KBr): 2926, 1693, 1632, 1393, 1168 cm⁻¹. MS (ESI-TOF) m/z: 548/550 (3:1) [M + Na]⁺. HRMS (ESI-TOF) m/z : 548.2690 calcd for C₂₇H₄₄N₃O₃S₃₅ClNa; found: 548.2692.

Biakamide A and B. TFA (33 μ L, 0.45 mmol, 10 equiv) was added to a solution of 19 (23.5 mg, 0.045 mmol) in CH_2Cl_2 (1 mL), and the whole mixture was stirred for 7 h. Sat. NaHCO₃ aq. was added to the mixture, and the whole mixture was extracted with AcOEt. Removal of the solvent from AcOEt extract under reduced pressure gave an amine 20, which was used in the next reaction without further purification.

A 38% aliquot of the above amine was dissolved to CH_2Cl_2 (3 mL). HOBt (3.9 mg, 0.047 mmol, 1.4 equiv), (S)-3-hydroxybutyric acid (6.0 mg, 0.05 mmol, 1.5 equiv), Et₃N (24 μ L, 0.17 mmol, 6.0 equiv), and EDCI·HCl (5.6 mg, 0.029 mmol, 1.4 equiv) were added to the solution, and the whole mixture was stirred for 15 h at rt. Sat. NH_4Cl aq. was added to the mixture; the whole mixture was extracted with AcOEt, and the AcOEt extract was washed with sat. $NH₄Cl$ aq., $NaHCO₃$ aq., and brine. Removal of the solvent from AcOEt extract under reduced pressure gave a crude product which was purified by $SiO₂$ column (AcOEt:MeOH = 5:1) to give a mixture of 1 and 2 (7.6)

mg, 74%, two steps) as a white powder. HPLC separation (Cosmosil $5C_{18}$ -MS-II, 10 mm i.d. \times 250 mm, MeOH:H₂O = 60:40, flow rate = 3.5 mL/min) yielded pure 1 and 2.

(4R,6S)-1. $[\alpha]_D^{28} + 1.2$ ($c = 0.57$, CHCl₃). Mixture of rotamers. ¹H NMR (600 MHz, CDCl₃) δ: 7.72 (1H, br s), 7.32 (1H, br s), 5.79 (0.4 \times 1H, s), 5.78 (0.6 \times 1H, s), 5.41 (1H, br), 4.87 (2H, s), 4.40 (0.4 \times 1H, s), 4.38 (0.6 × 1H, s), 4.20−4.16 (1H, m), 3.36−3.30 (0.6 × 2H, t-like), 3.27−3.18 (0.4 × 2H, m), 3.03 (3H, br s), 2.94 (0.6 × 3H, s), 2.91 (0.4 \times 3H, s), 2.55 (1H, br), 2.45 (1H, dd, J = 16.5, 2.1 Hz), 2.27 (1H, dd, J = 16.5, 9.6 Hz), 2.23−2.15 (1H, m), 2.15−2.08 (1H, m), 2.07−2.05 (2H, m), 1.87 (3H, s), 1.80 (1H, br), 1.70−1.59 (2H, m), 1.45−1.35 (2H, br), 1.33−1.08 (3H, m), 1.21 (3H, d, J = 6.6 Hz), 0.94 (3H, br), 0.88 (3H, br). ¹³C NMR (150 MHz, CDCl₃) δ : 173.6, 172.5, 172.4, 166.9, 142.2, 142.0, 141.4, 138.0, 128.87, 128.82, 120.0, 112.9, 112.4, 64.2, 64.1, 52.8, 49.0, 48.3, 47.2, 44.1, 41.1, 40.5, 37.0, 35.2, 33.9, 33.8, 33.0, 32.1, 31.7, 30.5, 29.78, 29.75, 29.6, 27.54, 27.50, 26.0, 25.1, 22.2, 22.1, 20.04, 20.01, 19.3, 14.1. IR (KBr): 3434, 2925, 1631, 1394 cm⁻¹. MS (ESI-TOF) m/z: 534/536 (3:1) [M + Na]⁺. HRMS (ESI-TOF) m/z : 534.2533 calcd for $C_{26}H_{42}N_3O_3S_{35}C1Na$; found: 534.2513.

(4R,6S)-2. $[\alpha]_D^2$ ⁶ +4.1 ($c = 0.42$, CHCl₃). Mixture of rotamers. ¹H NMR (600 MHz, CDCl₃) δ : 7.72 (1H, br s), 7.33 (1H, d, J = 2.4 Hz), 5.84 (0.4 \times 1H, s), 5.78 (0.6 \times 1H, s), 5.41 (1H, br), 4.87 (2H, s), 4.45 (1H, br), 4.22−4.15 (1H, m), 3.38 (0.6 × 2H, t-like), 3.30−3.22 $(0.4 \times 2H, m)$, 3.03 (3H, br s), 2.96 (0.6 \times 3H, s), 2.93 (0.4 \times 3H, s), 2.52 (1H, br), 2.46 (1H, ddd, J = 16.2, 9.0, 1.8 Hz), 2.29 (1H, ddd, J = 16.2, 9.6, 6.6 Hz), 2.23−2.14 (2H, m), 2.13−2.07 (1H, br), 2.02−1.94 (1H, br), 1.86 (3H, s), 1.71−1.60 (2H, m), 1.44−1.35 (1H, br), 1.25− 1.08 (3H, m), 1.22 (3H, d, J = 6.6 Hz), 0.94 (3H, br), 0.85 (3H, br). ¹³C NMR (150 MHz, CDCl₃) δ : 173.5, 172.5, 172.4, 166.8, 142.0 (br), 142.0, 141.4, 138.4, 128.84, 128.77, 120.0, 113.1, 112.5, 64.3, 64.1, 52.6, 49.3, 48.4, 47.2, 44.1, 41.1, 40.4, 36.9, 35.1, 34.9, 33.1, 32.5, 32.2, 30.2, 30.1, 29.74, 29.71, 27.4, 27.3, 25.6, 24.6, 22.2, 22.1, 19.92, 19.89, 19.6, 14.2. IR (KBr): 3435, 2962, 1628, 1398, 1261 cm⁻¹. MS (ESI-TOF) m/z : 534/536 (3:1) $[M + Na]^+$. HRMS (ESI-TOF) m/z : 534.2533 calcd for $C_{26}H_{42}N_3O_3S_{35}C$ INa; found: 534.2525.

Biakamide C and D. A 62% aliquot of the above amine 20 was dissolved to CH_2Cl_2 (3 mL). HOBt (6.4 mg, 0.047 mmol, 1.4 equiv), (E) -3-methoxybut-2-enoic acid (5.6 mg, 0.050 mmol, 1.5 equiv), $Et₃N$ (39 μL, 0.28 mmol, 6.0 equiv), and EDCI·HCl (9.0 mg, 0.047 mmol, 1.4 equiv) were added to the solution, and the whole mixture stirred for 25 h at rt. Sat. NH_4Cl aq. was added to the mixture; the whole mixture was extracted with AcOEt, and the AcOEt extract was washed with sat. $NH₄Cl$ aq., $NaHCO₃$ aq., and brine. Removal of the solvent from AcOEt extract under reduced pressure gave a crude product which was purified by $SiO₂$ column (AcOEt:MeOH = 50:1) to give a mixture of 3 and 4 (13.8 mg, 78%) as a white powder. HPLC separation (Cosmosil $5C_{18}$ -MS-II, 10 mm i.d. \times 250 mm, MeOH:H₂O $= 70:30$, flow rate $= 4.0$ mL/min) yielded pure 3 and 4.

(4R,6S)-3. $[\alpha]_D^2$ ⁷ –17.3 ($c = 0.48$, CHCl₃). Biological Evaluation of Biakamides A−D. Materials. Dulbecco's modified Eagle's medium (DMEM), WST-8 colorimetric reagent, and KCN were purchased from Nacalai Tesque, Inc. (Kyoto, Japan). Fetal bovine serum (FBS) and dialyzed FBS were purchased from Equitech-Bio Inc. (Kerrville, TX, United States) and Thermo Fisher Scientific Inc. (Waltham, MA, United States), respectively. Anti-Akt, antiphosphorylated Akt, anti-GRP78, and anti- β -tubulin antibodies were obtained from Cell Signaling Technology, Inc. (Danvers, MA, United States). Horseradish peroxidase (HRP)-linked anti-rabbit IgG antibody (GE Healthcare Life Sciences, Buckinghamshire, U.K.) was used as secondary antibody. Mito Check Complex Activity Assay Kit (Cayman Chemical, Ann Arbor, MI, United States) was used to evaluate the effect of 3 on the mitochondrial complex I−V. Rotenone,

thenoyltrifluoroacetone (TTFA), antimycin A, and oligomycin mixture were obtained from Tokyo Chemical Industry Co., Ltd. (Tokyo, Japan), Wako Pure Chemical Industries, Ltd. (Osaka, Japan), LKT Laboratories, Inc. (St. Paul, MN, United States), and Cayman Chemical (Ann Arbor, MI, United States), respectively. Other chemicals were purchased from Sigma-Aldrich (St. Louis, MO, United States) or Kishida Chemical Co., Ltd. (Osaka, Japan).

Cell Cultures. Human pancreatic cancer cell line PANC-1 was cultured in DMEM supplemented with heat-inactivated 10% fetal bovine serum (FBS) and kanamycin (50 μg/mL) in a humidified atmosphere of 5% $CO₂$ at 37 °C. In the case of the conditions of nutrient starvation, PANC-1 cells were cultured in the glucosedeficient medium [basal medium (25 mM HEPES buffer (pH 7.4) supplemented with 6.4 g/L NaCl, 700 mg/L NaHCO₃, 400 mg/L KCl, 265 mg/L CaCl₂·2H₂O, 200 mg/L MgSO₄·7H₂O, 125 mg/L NaH₂PO₄, 0.1 mg/L Fe(NO₃)·9H₂O, 15 mg/L phenol red, 10 mL/L MEM vitamin solution (×100) (GIBCO, Carlsbad, CA), 200 mmol/L L-glutamine solution (GIBCO, Carlsbad, CA), 25 mg/L kanamycin) containing 10% dialyzed FBS]. The general glucose medium [basal medium supplemented with 10% FBS and 2.0 g/L glucose (final 25 mM)] was also used for bioassay as the general culture conditions to compare the activity of the sample under the conditions of nutrient starvation.

Assay for Growth Inhibitory Activity under Glucose-Deprived Conditions. The PANC-1 cells in the culture medium were plated into each well of 96-well plates $(1 \times 10^4 \text{ cells/well}/100 \mu\text{L})$ for 12 h in a humidified atmosphere of 5% $CO₂$ at 37 °C. After removal of the medium, the cells in each well were rinsed with PBS twice. Then, the plates were incubated in either general glucose medium or glucosedeficient medium inducing adaptation toward austerity. After 12 h of incubation, testing compounds were added as an EtOH solution (1 μ L), and then the plates were incubated for an additional 12 h. The antiproliferative activities of the testing compounds under the respective conditions were evaluated by colorimetric assay using WST-8 reagent, and the growth inhibition rate was calculated as percentage of parallel negative controls.

Western Blotting Analysis. PANC-1 cells $(3.0 \times 10^5 \text{ cells}/2 \text{ mL in}$ 6 well plastic plate) were preincubated in the DMEM supplement with 10% FBS for 24 h. The medium was then replaced with either general glucose or glucose-deficient medium. After 12 h of incubation, 3 (0.5 μ M) or antimycin A (3.0 nM) as a positive control was added, and the cells were incubated for an additional 12 h in a humidified atmosphere of 5% $CO₂$ at 37 °C. Then, the cells were rinsed with ice-cold PBS and lysed in the lysis buffer (50 mM Tris-HCl (pH 8.0) containing 137 mM NaCl, 5 mM EDTA-2Na, 0.1% NP-40, 1% glycerol, 1% protease inhibitor cocktail, and 1% phosphatase inhibitor cocktail). The cell lysate was subjected to SDS−PAGE and transferred onto PVDF membranes (GE Healthcare Life Sciences Buckinghamshire, U.K.). The membranes were then incubated with appropriate primary antibodies and HRP-conjugated secondary antibodies, and the immunopositive bands were visualized using an ECL kit (GE Healthcare Life Sciences). The luminescent signals were analyzed using an ImageQuant LAS4010 Scanner (GE Healthcare Life Sciences).

Naoyuki Kotoku: 0000-0001-7639-5553

Author Contributions

 \perp N.K. and R.I. con[tributed equally to](http://orcid.org/0000-0001-7639-5553) this work.

Notes

The authors declare no competing financial interest.

■ ACKNOWLEDGMENTS

The authors are grateful to Dr. Nicole J. de Voogd of the National Museum of Natural History, The Netherlands for identification of the sponge and Mrs. Toshie Minematsu of the Joint Research Center, Kindai University, Japan for NMR measurements. The authors are also grateful to MEXT/JSPS KAKENHI (Grants JP23102005, JP26242074, and JP15K07996) for financial support. This study was also supported by the Platform Project for Supporting Drug Discovery and Life Science Research (Platform for Drug Discovery, Informatics, and Structural Life Science) from MEXT and the Japan Agency for Medical Research and Development (AMED).
