#### Abstract

The reaction between $\mathrm{CpFe}(\mathrm{CO})_{2} \mathrm{Na}$ and methyl-4-chloro-2-butenoate in tetrahydrofuran at $-78^{\circ} \mathrm{C}$ gives $\mathrm{CpFe}(\mathrm{CO})_{2}\left(\eta^{1}-\mathrm{CH}_{2}-\mathrm{CH}=\mathrm{CH}-\mathrm{CO}-\mathrm{OCH}_{3}\right)$ (1). Photolysis of 1 in ether at $-20^{\circ} \mathrm{C}$ yields $\mathrm{CpFe}(\mathrm{CO})\left(\eta^{3}-\mathrm{CH}_{2} \cdots \mathrm{CH} \cdots \mathrm{CH}-\mathrm{CO}-\mathrm{OCH}_{3}\right)$ (2). Attempts to prepare the corresponding $\eta^{5}$-oxapentadienyl from 2 by thermolysis or photolytic activation were unsuccessful. Photolysis of 2 in the presence of the phosphine ligands $\mathrm{R}_{3} \mathrm{P} \quad\left(\mathrm{R}_{3} \mathrm{P}=\mathrm{PMe}_{3}, \quad \mathrm{P}\left(\mathrm{OCH}_{3}\right)_{3}\right.$ gives $\mathrm{CpFe}\left(\mathrm{PR}_{3}\right)\left(\eta^{3}\right.$ $\left.\mathrm{CH}_{2} \cdots \mathrm{CH} \because \mathrm{CH}-\mathrm{CO}-\mathrm{OCH}_{3}\right)\left(\mathrm{PR}_{3}=\mathrm{PMe}_{3}\right.$ (3), $\mathrm{P}\left(\mathrm{OCH}_{3}\right)_{3}$ (4)). The molecular structure of 2 has been determined by an X-ray diffraction study. Crystallographic data: space group $P 21 / c, a$ 8.034(2), b 9.430(3), c 14.058(4) $\AA, \beta$ 94.42(2) ${ }^{\circ}, Z=4$, R 3.49\%, $R_{\mathrm{w}} 4.05 \%$.

## Introduction

There have been few reports of transition-metal-acyclic 1-oxapentadienyl compounds [1*]. Although this class of compounds has been obtained from several chemical reactions, they were often encountered as unexpected products and isolated in low yields. The reported synthetic procedures do not find general applisation [2]. For example, a rhenium complex (I) was obtained from the reaction between $\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{ReH}_{7}$ and furan under reflux in tetrahydrofuran (THF), in the presence of 3,3'-dimethyl-1-butene [1c]. The chemistry of metal-oxapenta-

[^0]dienyl compounds remains largely unexplored owing to the lack of suitable reagents. Recently, we have prepared a number of metal-pentadienyl compounds from 1-halo-2,4-pentadiene [3], a reagent that is convenient in the synthesis of $\eta^{1}, \eta^{3}$ and $\eta^{5}$-metal-dienyl compounds because it can be oxidatively added to low-valence metal complexes. In order to develop the chemistry of metal-oxapentadienyl compounds, we attempted the synthesis of iron-1-oxapentadienyl complexes derived from methyl 4-chloro-2-butenoate. One intriguing feature of these complexes is the variety of geometries possible for ligand bonding to the metal center, viz., the $\boldsymbol{\eta}^{3}$ and $\eta^{5}$ configurations [4]. The molecular structure of an iron- $\eta^{3}$-allyl ester complex is also described.

## Results and discussion

A previously published procedure [5], was used to give methyl 4-chloro-2butenoate in good yields. The $Z / E$ isomers were obtained in ca. 28.72 molar ratio. The reaction of methyl 4-chloro-2-butenoate with $\mathrm{CpFe}(\mathrm{CO})_{2} \mathrm{Na}$ in THF at $-78^{\circ} \mathrm{C}$ gave $\mathrm{CpFe}(\mathrm{CO})_{2}\left(\eta^{1}-\mathrm{CH}_{2}-\mathrm{CH}=\mathrm{CH}-\mathrm{CO}-\mathrm{OCH}_{3}\right)$ (1) in moderate yields (29\%). Compound 1 was obtained pure as a yellow oil after chromatography through an alumina column. Elemental analysis was consistent with our formulation. The mass spectrum revealed that 276 was the mass of the greatest ion and that the fragmentions resulted from the loss of a CO and then an ester group. The ${ }^{1} H$ NMR spectra revealed the presence of only the trans isomer although the starting reagent chloroester is present as both the $Z$ and the $E$ isomers. The trans isomer was characterized by the proton coupling constants $J_{23}=15.0 \mathrm{~Hz}$. Like $\mathrm{CpFe}(\mathrm{CO})_{2}\left(\eta^{1}-\right.$ 2,4-pentadienyl) [3e], this compound is fairly sensitive to air and decomposes slowly under argon at room temperature; but at $-20^{\circ} \mathrm{C}$ under argon it keeps for a week.

$$
\mathrm{L}=\mathrm{CO}, \mathrm{~L}=\mathrm{PMe}_{3}, \mathrm{~L}=\mathrm{P}(\mathrm{OMe})_{3}
$$

Complex 1 readily loses CO under photolytic irradiation at $-20^{\circ} \mathrm{C}$ in ether to give $\mathrm{CpFe}(\mathrm{CO})\left(\eta^{3}-\mathrm{CH}_{2} \cdots \mathrm{CH} \cdots \mathrm{CH}-\mathrm{CO}-\mathrm{OCH}_{3}\right)(2)$ in moderate yield. Red crystals of 2 were obtained after purification by column chromatography, followed by recrystallization from a saturated solution of 2 in pentane. The compound has been fully characterized by elemental and analysis, and mass, ${ }^{1} \mathrm{H}$ NMR and IR spectra. The ${ }^{1} \mathrm{H}$ NMR data show that the ligand is bonded to the metal in the $\eta^{3}$-allyl fashion rather than the oxa-allyl fashion. The $\nu(\mathrm{CO})$ band of the ester group occurs at $1698(\mathrm{~s}) \mathrm{cm}^{-1}$ and indicates of a free carbonyl group. In the $\eta^{3}$-enonyl ligand, the ester group is in the syn position as judged from the following coupling constants, $J_{13} 11.3 \mathrm{~Hz}, J_{34} 9.8 \mathrm{~Hz}$ and $J_{32} 7.2 \mathrm{~Hz}$. In the $\mathrm{CpFe}(\mathrm{CO})\left(\eta^{3}\right.$-allyl) system [6], the molecule probably exists as a mixture of exo and endo conformers owing to the differing orientations of the allyl group relative to the Cp group. Molecular structure of 2 was further characterised by an X-ray diffraction study.

Fig. 1. Molecular structure of complex 2.

The molecular structure of $\mathbf{2}$ is shown in Figure 1. The atomic coordinates, bond distances and angles are listed in Tables 1 and 2. The coordination geometry about the iron atom approximates a trigonal plane with the carbonyl, cyclopentadienyl, and allyl groups occupying the three coordination sites, if the cyclopentadienyl and allyl groups are regarded as unidentate ligands. The $\mathrm{L}-\mathrm{Fe}-\mathrm{L}$ angles are $123.5(2)^{\circ}$, $109.4(2)^{\circ}$ and $126.9(2)^{\circ}$ for $\mathrm{Cp}-\mathrm{Fe}-\mathrm{C}(1), \mathrm{C}(1)-\mathrm{Fe}-\mathrm{C}(8)$ and $\mathrm{Cp}-\mathrm{Fe}-\mathrm{C}(8)$ respectively ( Cp is the centroid of the cyclopentadienyl group). The five carbons of the cyclopentadienyl group lie $2.063-2.127 \AA$ away from the Cp group. These values are comparable to those of $\mathrm{CpFe}(\mathrm{CO})\left(\eta^{3}\right.$-pentadienyl) [3c]. The molecule has the exo conformation. The allyl ester is bonded to the iron atom in an asymmetric allyl fashion with $\mathrm{Fe}-\mathrm{C}(7) 2.127(4), \mathrm{Fe}-\mathrm{C}(8) 2.013(4)$, and $\mathrm{Fe}-\mathrm{C}(9) 2.107(4) \AA$. mouth of the allyl moiety faces away from the cyclopentadienyl group and is aligned with the CO group. A similar stereochemical arrangement is present in $\mathrm{CpFe}(\mathrm{CO})\left(\eta^{3}-2,4\right.$-hexadien-1-yl) [3c]. The ester group of the $\eta^{3}$-ligand points away from the rest of the complex, so minimizing steric hindrance. The $\mathrm{C}(8)-\mathrm{C}(9)$ bond lies trans to the $C(10)-O(3)$ bond and cis to the $C(10)-O(2)$ bond. The bond distances $C(10)-O(3)(1.345(4) \AA)$, and $C(10)-O(2)(1.205(4) \AA)$ reflect single and double bonds, respectively. These bond distances do not show a delocalization
pattern within the enonyl ligand. The atoms on the $\eta^{3}$-enonyl ligand are quite planar. The dihedral angle between the plane $(O(2), C(10), C(9))$ and the allylic plane ( $C(7), C(8), C(9)$ ) is $14.2(3)^{\circ}$, whereas the dihedral angle between the plane $(C(9), C(10), O(3))$ and allylic plane $(C(7), C(8), C(9))$ is $13.6(3)^{\circ}$.

In our previous paper [3], we have shown that the $\eta^{3} \rightarrow \eta^{5}$ transformation is feasible in the pentadienyl system. Neither thermal activation nor photolytic activation induce $\eta^{3} \rightarrow \eta^{5}$ conversion in 2. A solution of 2 in toluene under reflux yielded no corresponding $\eta^{5}$-oxapentadienyl compounds. Irradiation of 2 in benzene solution in a vacuum-sealed pyrex tube gave a precipitate of composition. The $C O$ group of 2 can be readily lost. Irradiation of 2 in the presence of phosphine ligands $\mathbf{R}_{3} \mathrm{P}\left(\mathrm{R}_{3} \mathrm{P}=\mathrm{PMe}_{3}, \mathrm{P}\left(\mathrm{OCH}_{3}\right)_{3}\right)$ gives the phosphine derivatives $\mathrm{CpFe}\left(\mathrm{R}_{3} \mathrm{P}\right)\left(\eta^{3}\right.$ $\left.\mathrm{CH}_{2} \because \mathrm{CH} \cdots \mathrm{CH}-\mathrm{CO}-\mathrm{OCH}_{3}\right)\left(\mathrm{R}_{3} \mathrm{P}=\mathrm{PMe}_{3}\right.$ (3), $\left.\mathrm{P}\left(\mathrm{OCH}_{3}\right)_{3}(4)\right)$ in high yields. Compounds 3 and 4 were obtained as red crystals after recrystallization from their saturated solutions in pentane. The crystals are fairly stable to air. Elemental analysis and the mass spectra are consistent with our formulations. Only one isomer was detected in solutions of each compound as revealed by the ${ }^{1} \mathrm{H}$ NMR spectra. A syn-W-configuration is assigned to the enolate ligand on the basis of its ${ }^{1} \mathrm{H}$ NMR coupling constants. 3 has been found to be the exo conformer, and 4 the endo conformer by comparison of their ${ }^{1} \mathrm{H}$ NMR data with those of 2. The chemical shifts of the $\mathrm{H}^{2}$ and $\mathrm{H}^{3}$ protons in both 3 and 4 are comparable to those of 2. Moreover, the proton resonances of $\mathrm{H}^{1}$ and $\mathrm{H}^{4}$ of 3 and 4 lie about $0.5-1.5 \mathrm{ppm}$ more upfield than those of 2 [3b]. The endo isomer is expected to show greater upfield chemical shifts of the $\mathrm{H}^{2}$ and $\mathrm{H}^{3}$ protons and greater downfield chemical shifts of $\mathrm{H}^{1}$ and $\mathrm{H}^{4}$ protons than those of the exo isomer [6]. In our previous paper [3c], we have shown that protonation of an $\eta^{3}$-pentadienyl complex gives an $\eta^{4}$-diene cation. The protonation site is the $\alpha$-carbon of the dienyl ligand. The addition of $\mathrm{HPF}_{6}$ to solutions of 2,3 or 4 , however, fails to yield the corresponding $\mathrm{CpFe}(\mathrm{L})\left(\eta^{4}-\right.$ $\left.\mathrm{CH}_{3}-\mathrm{CH}=\mathrm{CH}-\mathrm{CO}-\mathrm{OCH}_{3}\right)\left(\mathrm{L}=\mathrm{CO}, \mathrm{P}\left(\mathrm{OCH}_{3}\right)_{3}, \mathrm{PPh}_{3}\right)$. For the iron system, many $\eta^{4}-\mathrm{Fe}^{0}$-enone complexes have been reported [7], but the failure to obtain the corresponding $\mathrm{Fe}^{\mathrm{II}}$ complexes can be attributed to the electron deficiency of the $\mathrm{Fe}^{\mathrm{II}}$ ion. Organic carbonyls bonded to the metal in $\pi$-fashion have been reported to have the following geometries:

in addition to the $\boldsymbol{\eta}^{5}$-1-oxa-pentadienyl structure [7-9]. One common feature of these complexes is that the metals are in a low oxidation state because the carbonyl group is a very good $\pi$ acceptor. The degree of the electron transfer from the metal orbital to the vacant $\pi^{\star}$ orbital plays a key role in metal-ligand bonding. Similarly, the absence of the $\eta^{3} \rightarrow \eta^{5}$ transformation in 2 can be attributed to the electron deficiency of the $\mathrm{Fe}^{\mathrm{II}}$ ion. Other systems involving the synthesis of $\eta^{5}$-oxapentadienyl complexes bonded to low-valence metals are currently under investigation.

## Experimental section

All operations were performed under argon in a Schlenk apparatus or in a glovebox. The solvents diethyl ether, tetrahydrofuran (THF) and pentane were dried with sodium/benzophenone and distilled before use.

All ${ }^{1} \mathrm{H}(100$ and 400 MHz$)$ and ${ }^{13} \mathrm{C}(100 \mathrm{MHz})$ NMR were recorded on either a JEOL FX-100 or a Bruker AM-400 spectrometer. Infrared spectra were recorded on a Perkin-Elmer 781 spectrophotometer. Microanalyses were performed at the microanalytical laboratory, National Taiwan University.

Preparation of $\mathrm{CpFe}(\mathrm{CO})_{2}\left(\eta^{\prime}-\mathrm{CH}_{2}-\mathrm{CH}=\mathrm{CH}-\mathrm{CO}-\mathrm{OCH}_{3}\right)$ (1)
A solution ( 50 ml ) of $\mathrm{CpFe}(\mathrm{CO})_{2} \mathrm{Na}(1.56 \mathrm{~g}, 8.4 \mathrm{mmol}$ ) in THF ( 50 ml ) was added dropwise to methyl 4-chloro-2-butenoate ( $1.49 \mathrm{~g}, 10.4 \mathrm{mmol}$ ) in THF ( 20 ml ) at $-78^{\circ} \mathrm{C}$ and the mixture was stirred for 4 h . After the insoluble sodium chloride was filtered off, the solvent was evaporated to dryness in vacuo to yield a dark red residue. This residue was extracted twice with 20 ml ether, filtered and evaporated to dryness. The residue was chromatographed on a neutral alumina column ( 50 g ) at $23^{\circ} \mathrm{C}$ with ether as the eluant. The purple band, that was eluted first, was identified as $\mathrm{Cp}_{2} \mathrm{Fe}_{2}(\mathrm{CO})_{4}$. The second, a gold-yellow band, was collected, the solution was evaporated to dryness, to leave the yellow oil of $1(0.65 \mathrm{~g}, 2.45 \mathrm{mmol})$. Anal. Found: C, $52.25 ; \mathrm{H}, 4.24 . \mathrm{C}_{12} / \mathrm{H}_{12} \mathrm{FeO}_{4}$ calcd.: C, $52.17 ; \mathrm{H}, 4.34 \%$; . Mass spectrum (12 $\mathrm{eV}): m / e 276\left(M^{+}\right), 248\left(M^{+}-\mathrm{CO}\right), 220\left(M^{+}-2 \mathrm{CO}\right), 177\left(M^{+}-\mathrm{C}_{5} \mathrm{H}_{7} \mathrm{O}_{2}\right)$. IR spectrum (ether): $\nu(\mathrm{CO}) 2014(\mathrm{vs}) 1956(\mathrm{vs})$ and $1699 \mathrm{~cm}^{-1}(\mathrm{~s}) ; \nu(\mathrm{C}=\mathrm{C}) 1608 \mathrm{~cm}^{-1}$ (w). ${ }^{1} \mathrm{H}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ). $\delta 2.02\left(2 \mathrm{H}, \mathrm{d}, \mathrm{H}^{1} \mathrm{H}^{2}\right), 3.62\left(3 \mathrm{H}, \mathrm{s}, \mathrm{O}-\mathrm{CH}_{3}\right)$, $4.67\left(5 \mathrm{H}, \mathrm{s}, \mathrm{C}_{5} \mathrm{H}_{5}\right), 5,50\left(1 \mathrm{H}, \mathrm{d}, \mathrm{H}^{4}\right), 7.23\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}^{3}\right), J_{13} 9.5, J_{12} 1.2, J_{34} 15 \mathrm{~Hz}$.

Preparation of $\mathrm{CpFe}(\mathrm{CO})\left(\eta^{3}-\mathrm{CH}_{2} \cdots \mathrm{CH} \because \mathrm{CH}-\mathrm{CO}-\mathrm{OCH}_{3}\right)$ (2)
A solution of $1(0.5 \mathrm{~g}, 1.81 \mathrm{mmol})$ in ether $(25 \mathrm{ml})$, in a vacuum-sealed tube was irradiated with a $400-\mathrm{W}$ mercury lamp at $-20^{\circ} \mathrm{C}$ for 6 h . After removal of the solvent under reduced pressure, the residue was chromatographed on a silica gel column ( 30 g , Merck) at $25^{\circ} \mathrm{C}$ with ether as the eluant. An orange band, that was eluted first and identified as 2 , was collected and evaporated to dryness. The orange residue was dissolved in pentane and cooled to $4^{\circ} \mathrm{C}$ to yield dark red cyrstals of 2 ( $0.38 \mathrm{~g}, 1.53 \mathrm{mmol}$ ). Anal. Found: C, 53.26; H, 4.92. $\mathrm{C}_{11} \mathrm{H}_{12} \mathrm{FeO}_{3}$ calcd.: C, 53.27; H, $4.84 \%$. Mass spectrum ( 12 eV ): $m / e 248\left(M^{+}\right), 220\left(M^{+}-\mathrm{CO}\right)$. IR spectrum (ether) $\nu(\mathrm{CO}): 1953(\mathrm{vs})$ and $1698(\mathrm{vs}) \mathrm{cm}^{-1} .{ }^{1} \mathrm{H} \mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta$ $0.90\left(1 \mathrm{H}, \mathrm{d}, \mathrm{H}^{1}\right), 1.19\left(1 \mathrm{H}, \mathrm{d}, \mathrm{H}^{4}\right) 2.96\left(1 \mathrm{H}, \mathrm{d}, \mathrm{H}^{2}\right), 3.65\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.40(5 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{C}_{5} \mathrm{H}_{5}\right), 5.44\left(1 \mathrm{H}\right.$, ddd, $\left.\mathrm{H}^{3}\right), J_{13} 11.37, J_{34} 9.78, J_{23} 7.25 \mathrm{~Hz} .{ }^{13} \mathrm{C}\{\mathrm{H}\} \quad \mathrm{NMR}(100$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 34.76\left(\mathrm{CH}_{2}\right), 38.44\left(\mathrm{CH}^{4}\right), 59.68\left(\mathrm{O}-\mathrm{CH}_{3}\right), 77.1\left(\mathrm{CH}^{3}\right), 80.2\left(\mathrm{C}_{5} \mathrm{H}_{5}\right)$, $177.1\left(\mathrm{CO}-\mathrm{OCH}_{3}\right), 220.9(\mathrm{Fe}-\mathrm{CO})$.

Preparation of $\mathrm{CpFe}\left(\mathrm{P}_{\left.\left(\mathrm{CH}_{3}\right)_{3}\right)\left(\eta^{3}-\mathrm{CH}_{2} \cdots \mathrm{CH} \because \mathrm{CH}-\mathrm{CO}-\mathrm{OCH}_{3}\right)}\right.$
A mixture of $\mathrm{P}\left(\mathrm{CH}_{3}\right)_{3}(0.19 \mathrm{~g}, 1.3 \mathrm{mmol})$ and $2(0.5 \mathrm{~g}, 0.20 \mathrm{mmol})$ in a vacuum-sealed tube was irradiated with a $400-\mathrm{W}$ mercury lamp at $-20^{\circ} \mathrm{C}$ for 6 h . After removal of the solvent under reduced pressure, the residue was chromatographed on a silica gel column ( 30 g , Merck) with ether as the eluant. An orange band was eluted and identified as 3 . A brown purple band of $\mathrm{Cp}_{2} \mathrm{Fe}(\mathrm{CO})_{4}$ remained in the top portion of the column. Recrystallization from pentane at $-20^{\circ} \mathrm{C}$ gave
red crystals ( $0.38 \mathrm{~g}, 1.29 \mathrm{mmol}$ ). Anal. Found: $\mathrm{C}, 52.88 ; \mathrm{H}, 7.19 . \mathrm{C}_{13} \mathrm{H}_{21} \mathrm{FeO}_{2} \mathrm{P}$ calcd.: C, $52.70 ; \mathrm{H}, 7.09 \%$. Mass spectrum ( 12 eV ): $\mathrm{m} / \mathrm{e}: 296\left(\mathrm{M}^{+}\right), 220\left(M^{+}-\right.$ $\mathrm{PMe}_{3}$ ). IR spectrum (ether) $\nu(\mathrm{CO}): 1696(\mathrm{~s}) \mathrm{cm}^{-1}{ }^{1} \mathrm{H} \mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta$ $-0.22\left(1 \mathrm{H}, \mathrm{dd}, \mathrm{H}^{1}\right),-0.11\left(1 \mathrm{H}, \mathrm{dd}, \mathrm{H}^{4}\right), 1.24\left(9 \mathrm{H}, \mathrm{d}, \mathrm{PMe}_{3}\right), 2.62\left(1 \mathrm{H}, \mathrm{d}, \mathrm{H}^{2}\right)$, $3.12\left(3 \mathrm{H}, \mathrm{S}, \mathrm{OCH}_{3}\right), 3.95\left(5 \mathrm{H}, \mathrm{S}, \mathrm{C}_{5} \mathrm{H}_{5}\right), 5.54\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}^{3}\right), J_{13} 10.5, J_{34} 9.0, J_{23} 5.8$, $J\left(\mathrm{H}^{1} \mathrm{P}\right)=17.0, J\left(\mathrm{H}^{4} \mathrm{P}\right) 14.6, J\left(\mathrm{PMe}_{3}, \mathrm{P}-\mathrm{H}\right) 8.0 \mathrm{~Hz} .{ }^{13} \mathrm{C}\{\mathrm{H}\}$ NMR $(400 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta 29.54\left(\mathrm{CH}^{1} \mathrm{H}^{2}\right), 18.6\left(\mathrm{~d}, J 18 \mathrm{~Hz}, \mathrm{PMe}_{3}\right), 35.6\left(\mathrm{CH}^{4}\right), 50.4\left(\mathrm{OCH}_{3}\right)$, $71.98\left(\mathrm{CH}^{3}\right), 75.6\left(\mathrm{C}_{5} \mathrm{H}_{5}\right), 160.0\left(\mathrm{CO}-\mathrm{OCH}_{3}\right)$.

Preparation of $\mathrm{CpFe}\left(\mathrm{P}_{\left.\left(\mathrm{OCH}_{3}\right)_{3}\right)\left(\eta^{3}-\mathrm{CH}_{2} \cdots \mathrm{CH} \cdots \mathrm{CH}-\mathrm{CO}-\mathrm{OCH}_{3}\right) \text { (4) }}^{(4)}\right.$
This complex was prepared similarly by photolytic reaction of $\mathrm{P}\left(\mathrm{OCH}_{3}\right)_{3}$ and 2 in a vacuum-sealed tube. The yield was $52 \%$. Anal. Found: C, 45.54; H, 6.24. $\mathrm{C}_{13} \mathrm{H}_{21} \mathrm{FeO}_{5} \mathrm{P}$ calcd.: $\mathrm{C}, 45.34 ; \mathrm{H}, 6.10 \%$. Mass spectrum ( 12 eV ): $\mathrm{m} / e 344\left(M^{+}\right)$, $220\left(M^{+}-\mathrm{P}\left(\mathrm{OCH}_{3}\right)_{3}\right)$. IR spectrum (ether) $\boldsymbol{\nu}(\mathrm{CO}): 1697(\mathrm{~s}) \mathrm{cm}^{-1} .{ }^{1} \mathrm{H}$ NMR (400

Table 3
Summary of crystal data and intensity collection

| Empirical formula | $\mathrm{C}_{11} \mathrm{H}_{12} \mathrm{O}_{3} \mathrm{Fe}$ |
| :--- | :--- |
| Color; habit | orange; columnar |
| Crystal size $\left(\mathrm{mm}^{3}\right)$ | $0.40 \mathrm{~mm} \times 0.48 \mathrm{~mm} \times 0.58 \mathrm{~mm}$ |
| Space group | monoclinic, $P 2_{1} / c$ |
| Unit cell dimensions | $a=8.034(2) \AA$ |
|  | $b=9.430(3) \AA$ |
|  | $c=14.058(4) \AA$ |
|  | $\beta=94.42(2)^{\circ} \AA$ |
| Volume | $1061.9(5) \AA^{3}$ |
| Formula units/cell | 4 |
| Formula weight | 248.1 AMU |
| Density (calc.) | $1.552 \mathrm{~g} / \mathrm{cm}^{3}$ |
| Absorption coefficient | $1.400 \mathrm{~mm}{ }^{-1}$ |
| $F(000)$ | $512 \mathrm{e}^{-}$ |
| Diffractometer used | Nicolet $\mathrm{R} 3 \mathrm{~m} / \mathrm{V}$ |
| Radiation | $\mathrm{Mo}^{\circ}-K_{\alpha}(\lambda=0.71073 \AA)$ |
| Temperature | $23^{\circ} \mathrm{C}$. |
| Monochromator | Highly oriented graphite crystal |
| 2 range | 2.0 to $50.0^{\circ}$ |
| Scan type | $\theta / 2 \theta$ |
| Scan speed | Variable; 2.93 to $14.65^{\circ} / \mathrm{min}$. |
| Scan range | $1.20^{\circ}$ plus $K_{\alpha}$-separation |
| Standard reflections | 3 measured every 50 reflections |
| Index ranges | $-9 \leqslant h \leqslant 9,-1 \leqslant k \leqslant 11,-16 \leqslant l \leqslant 1$ |
| Reflections collected | $2228(1687>3 \sigma(I))$ |
| Unique reflections | $1880(1477>3 \sigma(I))$ |
| Hydrogen atoms | Riding model, fixed isotropic $U$ |
| Weighting scheme | $w^{-1}=\sigma^{2}(F)+0.0010 F^{2}$ |
| Final residuals (obs. data) | $R==3.49 \%, R_{w}=4.05 \%$ |
| Goodness-of-fit | 1.44 |
| Largest and mean $\Delta / \sigma$ | $0.037,-0.001$ |
| Data-to-parameter ratio | $10.9: 1$ |
| Largest difference peak | $0.60 \mathrm{e}^{-} / \AA^{3}$ |

$\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 0.27\left(1 \mathrm{H}, \mathrm{dd}, \mathrm{H}^{1}\right), 0.53\left(1 \mathrm{H}, \mathrm{dd}, \mathrm{H}^{4}\right), 2.66\left(1 \mathrm{H}, \mathrm{d}, \mathrm{H}^{2}\right), 3.60(3 \mathrm{H}, \mathrm{s}$, $\left.-\mathrm{O}-\mathrm{CH}_{3}\right), 3.53\left(9 \mathrm{H}, \mathrm{d}, \mathrm{P}\left(\mathrm{OCH}_{3}\right)_{3}, 4.07\left(5 \mathrm{H}, \mathrm{s}, \mathrm{C}_{5} \mathrm{H}_{5}\right), 5.50\left(1 \mathrm{H}, \mathrm{m}, \mathrm{H}^{3}\right), J_{13} 10.3\right.$, $J_{34} 9.4 J_{23} 7.4, J\left(\mathrm{H}^{1} \mathrm{P}\right) 16.1, J\left(\mathrm{H}^{2} \mathrm{P}\right) 13.0, J\left(\mathrm{P}-\mathrm{OCH}_{3}\right) 12 \mathrm{~Hz}^{13} \mathrm{C}\{\mathrm{H}\}$ NMR ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 20.6\left(\mathrm{CH}_{2}\right) .35 .4\left(\mathrm{CH}^{4}\right), 50.5\left(\mathrm{O}_{-} \mathrm{CH}_{3}\right), 50.2,(\mathrm{~d}, J 40 \mathrm{~Hz}$, $\left.\mathrm{P}-\mathrm{OCH}_{3}\right), 70.0\left(\mathrm{CH}^{3}\right), 76.4\left(\mathrm{C}_{5} \mathrm{H}_{5}\right), 178.4\left(\mathrm{CO}-\mathrm{OCH}_{3}\right)$.

## Crystal data for 2

Compound 2 crystallizes in the monoclinic space group $P 2_{1} / c$ with lattice parameters: $a$ 8.034(2), $b$ 9.430(3), c 14.058(4) $\AA, \beta 94.42(2)^{\circ}$, Molecular weight $248.1, D$ (calcd.) $1.552 \mathrm{~g} / \mathrm{cm}^{3}$ and $Z=4$. The structure was solved and refined to $R$ and $R_{w}$ values 0.0349 and 0.0405 , respectively, for 1477 reflections.
$X$-ray diffraction study. The crystal and molecular structure determination of compound 2 was carried out. Crystal data and details of the intensity data collection are summarized in Table 3. Unit cell dimensions were determined from a leastsquares refinement of fifteen carefully centered reflections ( $2 \theta$ ranging from $8.03^{\circ}$ to $27.71^{\circ}$ ). The intensity data were corrected for Lorentz and polarization effects. Five reflections with $2 \theta$ angles ranging from $13.04^{\circ}$ to $44.24^{\circ}$ and their $\chi$ angles near $90^{\circ}$ were scanned in 100 steps of $\chi$, and the crystal showed transmission factors varying from 0.731 to 0.929 , thus, empirical corrections were made for absorption.

The space group $P 2_{1} / c$ was determined from the systematic absences: $0 k 0$, $k=2 n+1 ; h 0 l, l=2 n+1$. Atomic scattering factors were obtained from International Tables for X-ray Crystallography [10]. The structure was solved by direct methods. All the nonhydrogen atoms were located from $E$ maps and then anisotropically refined by full matrix least-squares. The positions of all hydrogen atoms were calculated and refined isotropically. The final difference map showed no other features with electron densities of less than $0.60 \mathrm{e}-\AA^{-3}$. All calculations were performed on a MicroVAX II based Nicolet SHELXTL PLUS system [11]. The positional and thermal parameters of all the nonhydrogen atoms are given in Table 2. Tables of anisotropic thermal parameters, hydrogen atom parameters, and structure factors are available from the authors.
