#### Abstract

Reaction of $\mathrm{Ru}\left(\mathrm{CF}_{3}\right) \mathrm{Br}(\mathrm{CO})_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ with an excess of $\mathrm{BBr}_{3}$ produces a red salt identified as $\left[\mathrm{RuBr}(\mathrm{CO})_{2}\left\{=\mathrm{C}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PPh}_{2}\right)_{2}\right\}\right] \mathrm{BBr}_{4}$. Upon standing this solid loses CO and $\mathrm{BBr}_{3}$, to form $\mathrm{RuBr}_{2}(\mathrm{CO})\left[=\mathrm{C}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PPh}_{2}\right)_{2}\right], \mathrm{A}$, the structure of which has been determined by X-ray diffraction. The geometry about ruthenium is approximately octahedral, with the two phosphorus atoms of the tridentate bisphosphinocarbene ligand mutually trans, and one bromide trans to the carbene carbon. The other bromide and the carbonyl ligand are statistically interchanged about a crystallographic diad axis which passes through the carbene carbon, the ruthenium, and the trans bromide. The $\mathrm{Ru}-\mathrm{P}$ distance is $2.353(2) \AA$, the $\mathrm{Ru}-\mathrm{Br}$ distances are $2.638(2) \AA$ (trans to carbene) and 2.537(2) $\AA$ (trans to CO), and the $\mathrm{Ru}=\mathrm{C}$ (carbene) distance is $1.941(12) \AA$. Bromide is removed from compound $\mathbf{A}$ by treatment with $\mathrm{AgSbF}_{6}$ in MeCN to give $\left[\mathrm{RuBr}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)\left\{=\mathrm{C}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PPh}_{2}\right)_{2}\right\}\right] \mathrm{SbF}_{6}$, and this when treated with CO gives $\left[\mathrm{RuBr}(\mathrm{CO})_{2}\left\{=\mathrm{C}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PPh}_{2}\right)_{2}\right\}\right] \mathrm{SbF}_{6}$. The dicarbonyl cation reacts with $\mathrm{NaBH}_{4}$ to give $\mathrm{RuBr}(\mathrm{CO})_{2}\left[\mathrm{CH}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PPh}_{2}\right)_{2}\right]$, and with $\mathrm{HNEt}_{2}$ to give $\mathrm{RuBr}(\mathrm{CO})_{2}\left[\mathrm{C}\left(\mathrm{NEt}_{2}\right)\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PPh}_{2}\right)_{2}\right]$.

## Introduction

In a number of cases, reaction between boron trihalides and transition metal complexes containing a metal-bound trifluoromethyl ligand results in exchange of fluorine to give a new trihalomethyl complex [1,2]. This exchange is specific for fluorines on the carbon $\alpha$ to the metal, e.g.:
$\mathrm{Mn}\left(\mathrm{CF}_{3}\right)(\mathrm{CO})_{5} \xrightarrow{\mathrm{BCl}_{3}} \mathrm{Mn}\left(\mathrm{CCl}_{3}\right)(\mathrm{CO})_{5}$
$\operatorname{Re}\left(\mathrm{CF}_{2} \mathrm{CF}_{3}\right)(\mathrm{CO})_{5} \xrightarrow{\mathrm{BCl}_{3}} \operatorname{Re}\left(\mathrm{CCl}_{2} \mathrm{CF}_{3}\right)(\mathrm{CO})_{5}$

The mechanism of this halide exchange is not known with certainty, but a stepwise process involving a cationic intermediate, $\left[\mathrm{L}_{n} \mathrm{M}=\mathrm{CX}_{2}\right]^{+}$, with a $\mathrm{BX}_{4}^{-}$counterion is likely, viz.:
$\mathrm{L}_{n} \mathrm{M}-\mathrm{CF}_{3}+\mathrm{BCl}_{3} \rightarrow\left[\mathrm{~L}_{n} \mathrm{M}=\mathrm{CF}_{2}\right]^{+}\left[\mathrm{BCl}_{3} \mathrm{~F}\right]^{-} \rightarrow \mathrm{L}_{n} \mathrm{M}-\mathrm{CF}_{2} \mathrm{Cl}+\mathrm{BCl}_{2} \mathrm{~F}$
$\xrightarrow{\text { etc. }} \xrightarrow{\text { etc. }} \mathrm{L}_{n} \mathrm{M}-\mathrm{CCl}_{3}$
An example of this process is the reaction of $\mathrm{Ru}\left(\mathrm{CF}_{3}\right) \mathrm{Cl}(\mathrm{CO})_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ [3], with $\mathrm{BCl}_{3}$, which leads in high yield [4] to the known dichlorocarbene complex $\mathrm{RuCl}_{2}\left(=\mathrm{CCl}_{2}\right)(\mathrm{CO})\left(\mathrm{PPh}_{3}\right)_{2}$ [5].

In an endeavour to use this approach for the synthesis of previously unknown dibromocarbene complexes of ruthenium the reaction between a trifluoromethyl complex of ruthenium and boron tribromide was examined, and the results are reported below. Some of these results have been mentioned briefly in a review [6].

## Results and discussion

To avoid complications resulting from mixtures of different halide ligands the compound $\mathrm{Ru}\left(\mathrm{CF}_{3}\right) \mathrm{Br}(\mathrm{CO})_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ was chosen for reactions with $\mathrm{BBr}_{3}$. This compound was prepared from $\mathrm{Ru}\left(\mathrm{CF}_{3}\right)\left(\mathrm{HgCF}_{3}\right)\left(\mathrm{CO}_{2}\left(\mathrm{PPh}_{3}\right)_{2}\right.$ [3] through reaction with $\mathrm{Br}_{2}$.

(A)
(* intermediates not isolated)
Scheme 1

Reaction between $\mathrm{Ru}\left(\mathrm{CF}_{3}\right) \mathrm{Br}(\mathrm{CO})_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ and I equivalent of $\mathrm{BBr}_{3}$
When $\mathrm{Ru}\left(\mathrm{CF}_{3}\right) \mathrm{Br}(\mathrm{CO})_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ was treated with approximately one equivalent of $\mathrm{BBr}_{3}$ a bright orange product was isolated, but could not be purified. However, from the similarity of the IR spectrum to that of $\mathrm{RuCl}_{2}\left(=\mathrm{CCl}_{2}\right)(\mathrm{CO})\left(\mathrm{PPh}_{3}\right)_{2}$ [5], and from further reactions, it was clearly a mixture of $\mathrm{RuBr}_{2}(\mathrm{CO})_{2}\left(\mathrm{PPh}_{3}\right)_{2}$, $\mathrm{RuBr}_{2}(=\mathrm{CFBr})(\mathrm{CO})\left(\mathrm{PPh}_{3}\right)_{2}$ (mostly), and possibly smaller amounts of other dihalocarbene complexes. Reaction with water produced exclusively $\mathrm{RuBr}_{2}(\mathrm{CO})_{2^{-}}$ $\left(\mathrm{PPh}_{3}\right)_{2}$, and reaction with $\mathrm{Me}_{2} \mathrm{NH}$ gave substantial amounts of $\mathrm{RuBr}_{2}\left(=\mathrm{CFNMe}_{2}\right)$ $(\mathrm{CO})\left(\mathrm{PPh}_{3}\right)_{2}$. A related compound, $\mathrm{RuCl}_{2}(=\mathrm{CFNMe} 2)(\mathrm{CO})\left(\mathrm{PPh}_{3}\right)_{2}$, has previously been prepared by reaction between $\mathrm{RuCl}_{2}\left(=\mathrm{CF}_{2}\right)(\mathrm{CO})\left(\mathrm{PPh}_{3}\right)_{2}$ and $\mathrm{Me}_{2} \mathrm{NH}$ [3].

Reaction between $\mathrm{Ru}\left(\mathrm{CF}_{3}\right) \mathrm{Br}(\mathrm{CO})_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ and excess $\mathrm{BBr}_{3}$
Increasing the amount of $\mathrm{BBr}_{3}$ used in the reaction with $\mathrm{Ru}\left(\mathrm{CF}_{3}\right) \mathrm{Br}(\mathrm{CO})_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ afforded a dark orange solid, which fumed in moist air and had an IR spectrum compatible with a salt-like material ( $\nu(\mathrm{CO})$ at $2080,2020 \mathrm{~cm}^{-1}$, appropriate for a cation; and $\boldsymbol{\nu}(\mathrm{B}-\mathrm{Br})$ at $605 \mathrm{~cm}^{-1}$ for $\left.\mathrm{BBr}_{4}^{-}\right)$. Upon standing this solid lost CO and

$\mathrm{BBr}_{3}$ to form a purple compound, which was shown by an X-ray crystal structure determination to be the bicyclic complex $\mathrm{RuBr}_{2}(\mathrm{CO})\left[=\mathrm{C}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{P} \mathrm{Ph}_{2}\right)_{2}\right]$ (A). A possible sequence of steps involved in the formation of $\mathbf{A}$, based upon precedents for electrophilic dihalocarbene ligands participating in metallacycle formation [7], is depicted in Scheme 1.

## X-Ray crystal structure

The molecular geometry of $\mathrm{RuBr}_{2}(\mathrm{CO})\left[=\mathrm{C}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PPh}_{2}\right)_{2}\right](\mathrm{A})$ is shown in Figs. 1 and 2. Important bond distances and angles are presented in Table 1. The ruthenium is in a distorted octahedral arrangement of two bromides, a carbonyl, and a tridentate bis(phosphino)-carbene moiety. The $\mathrm{Ru}-\mathrm{Br}(1)$ bond for the bromide trans to the carbene is $2.638(2) \AA$, significantly longer (by $50 \sigma$ ) than the $\operatorname{Ru}-\operatorname{Br}(2)$ bond trans to CO of $2.537(2) \AA$. Such a lengthening is consistent with the known strong structural trans-influence of other carbene ligands and with the ease of bromide removal from the complex with $\mathrm{Ag}^{+}$, which is described below. The $\mathrm{Ru}-\mathrm{Br}(1)$ and $\mathbf{R u}-\mathbf{C}(2)$ bonds are required to be strictly colinear. The bis(phosphino)-carbene ligand shows evidence of considerable strain, as would be expected. The bond lengths (Table 2) are normal ( $\mathrm{Ru}-\mathbf{P}$ 2.353(2), $\mathrm{P}-\mathrm{C}$ 1.82-1.83, $\mathrm{Ru}-\mathrm{C}(2) 1.94(1) \AA$ ) but many of the bond angles are far from ideal values. In particular we note: (i) the values of the angles $\mathrm{P}-\mathrm{Ru}-\mathrm{P}^{\prime} 162.0^{\circ}$, $\mathrm{Ru}-\mathrm{P}-\mathrm{C}(11) 127.8(3)^{\circ}$, $\mathrm{Ru}-\mathrm{P}-\mathrm{C}(21)$ $115.3(3)^{\circ}$, and $\mathrm{Ru}-\mathrm{P}-\mathrm{C}(31) 97.4(3)^{\circ}$; and (ii) the asymmetry of the angles at $\mathrm{C}(31)$ and $C(36)$.

Further reactions of $\left.\left.\widehat{\mathrm{RuBr}_{2}(\mathrm{CO})\left[=\mathrm{C}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{P}\right.\right.} \mathrm{Ph}_{2}\right)_{2}\right]$
Reaction between compound A and $\mathrm{AgSbF}_{6}$ in acetonitrile leads to a precipitate of AgBr , and from the solution orange crystals of $\left\{\mathrm{RuBr}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)\left\{=\mathrm{C}\left(\mathrm{C}_{6} \mathrm{H}_{4^{-}}\right.\right.\right.$ $\left.\left.\left.\mathrm{PPh}_{2}\right)_{2}\right\}\right] \mathrm{SbF}_{6}$ can be isolated (Scheme 1). A similar reaction carried out in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$

Scheme 2
and with introduction of CO , leads to the dicarbonyl compound $\left[\overline{\mathrm{RuBr}(\mathrm{CO})_{2}\{=} \bar{C}-\right.$ $\left.\left.\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PPh}_{2}\right)_{2}\right\}\right] \mathrm{SbF}_{6}$. The carbene centre in these cations has enhanced reactivity towards nucleophiles, and the dicarbonyl cation when treated with $\mathrm{NaBH}_{4}$ gives
 $\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PPh}_{2}\right)_{2}$ ]. These reactions are depicted in Scheme 2. IR data for all the new compounds are reported in Table 2.

## Experimental

The general experimental techniques have been described previously [8]. Reactions involving $\mathrm{BBr}_{3}$ were performed by use of standard Schlenk procedures. $\mathrm{Hg}\left(\mathrm{CF}_{3}\right)_{2}$ [9] and $\mathrm{Ru}(\mathrm{CO})_{3}\left(\mathrm{PPh}_{3}\right)_{2}$ [10] were prepared by published methods.

[^0]$\mathrm{Ru}\left(\mathrm{CF}_{3}\right)\left(\mathrm{HgCF}_{3}\right)(\mathrm{CO})_{2}\left(\mathrm{PPh}_{3}\right)_{2}$
A solution of $\mathrm{Ru}(\mathrm{CO})_{3}\left(\mathrm{PPh}_{3}\right)_{2}(3.0 \mathrm{~g})$ and $\mathrm{Hg}\left(\mathrm{CF}_{3}\right)_{2}(1.6 \mathrm{~g})$ in degassed toluene $(180 \mathrm{ml})$ was heated under reflux for 45 min . The solution was then cooled and the solvent removed on a rotary evaporator. The residual solid was dissolved in a minimum of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and $\mathrm{MeOH}\left(30 \mathrm{ml}\right.$ ) was added. Removal of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ under reduced pressure gave a white solid, which was recrystallised from $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}$ to yield white crystals ( $3.1 \mathrm{~g}, 72 \%$ ). M.p. $199-201^{\circ}$ C. Anal. Found: C, $47.62 ; \mathrm{H}$, 3.38. $\mathrm{C}_{40} \mathrm{H}_{30} \mathrm{~F}_{6} \mathrm{HgO}_{2} \mathrm{P}_{2} \mathrm{Ru}$ calcd.: $\mathrm{C}, 47.08 ; \mathrm{H}, 2.96 \%$. This compound has been further characterised by an X-ray crystal structure analysis [3].
$\mathrm{Ru}\left(\mathrm{CF}_{3}\right) \mathrm{Br}(\mathrm{CO})_{2}\left(\mathrm{PPh}_{3}\right)_{2}$
$\mathrm{Ru}\left(\mathrm{CF}_{3}\right)\left(\mathrm{HgCF}_{3}\right)(\mathrm{CO})_{2}\left(\mathrm{PPh}_{3}\right)_{2}(2.0 \mathrm{~g})$ was dissolved in 100 ml of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and a $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution of $\mathrm{Br}_{2}(2 \mathrm{~g}$ in 10 ml$)$ was added until the colour of $\mathrm{Br}_{2}$ just persisted. $\mathrm{EtOH}(300 \mathrm{ml})$ was added and the $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ removed under reduced pressure. The resulting white solid was filtered off and recrystallised from $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{EtOH}$ as a partial $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solvate ( $1.34 \mathrm{~g}, 82 \%$ ) M.p. $233-237^{\circ} \mathrm{C}$. Anal. Found: $\mathrm{C}, 54.54 ; \mathrm{H}, 4.09 . \mathrm{C}_{39} \mathrm{H}_{30} \mathrm{BrF}_{3} \mathrm{O}_{2} \mathrm{P}_{2} \mathrm{Ru} .\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)_{0.25}$ calcd.: $\mathrm{C}, 55.34 ; \mathrm{H}$, 3.61\%.
$\left.\left.\left[\overline{\mathrm{RuBr}(\mathrm{CO})_{2}\left\{=\mathrm{C}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PP}\right.\right.} \mathrm{P}_{2}\right)_{2}\right]\right] \mathrm{BBr}_{4}$
A solution of $\mathrm{Ru}\left(\mathrm{CF}_{3}\right) \mathrm{Br}(\mathrm{CO})_{2}\left(\mathrm{PPh}_{3}\right)_{2}(1.0 \mathrm{~g})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50 \mathrm{ml})$ was cooled to $-78^{\circ} \mathrm{C}, 10 \mathrm{ml}$ of a solution of $\mathrm{BBr}_{3}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(0.96 \mathrm{~mol} \mathrm{l}{ }^{-1}\right)$ were added, and the solution was allowed to warm to room temperature, turning a deep-orange colour. The solution was stirred for a further 20 min , and the volume then reduced to 10 ml under reduced pressure. Hexane ( 40 ml ) was added to precipitate the orange solid ( $1.19 \mathrm{~g}, 89 \%$ ). The instability of this compound prevented satisfactory determination of analytical data, but the formulation was clear from the IR spectrum and from the following reaction.

```
\(\widehat{\mathrm{RuBr}_{2}(\mathrm{CO})\left[=\mathrm{C}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PP} h_{2}\right)_{2}\right]}\)
```

A solid sample of $\left[\mathrm{RuBr}(\mathrm{CO})_{2}\left\{=\mathrm{C}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PPR}_{2}\right)_{2}\right\}\right] \mathrm{BBr}_{4}(500 \mathrm{mg})$ was kept in a desiccator for 5 days during which the solid changed from orange to purple. The product was purified by chromatography on a silica-gel column ( $25 \times 3 \mathrm{~cm}$ ) with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ as the initial eluant to remove $\mathrm{RuBr}_{2}(\mathrm{CO})_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ and an unidentified orange impurity. The product was then eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}:$ THF $(9: 1)$ and recrystallised from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ /cyclohexane to yield purple crystals ( $260 \mathrm{mg}, 70 \%$ ). M.p. $254-256^{\circ} \mathrm{C}$. Anal. Found: C, $55.22 ; \mathrm{H}, 3.83 ; \mathrm{Br}, 20.30 . \mathrm{C}_{38} \mathrm{H}_{28} \mathrm{Br}_{2} \mathrm{OP}_{2} \mathrm{Ru}$ calcd.: C, 55.43; H, 3.43; Br, 19.41\%.

## $\left.\left[\mathrm{RuBr}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)\left\{=\mathrm{Cl}_{6} \mathrm{H}_{4} \mathrm{PPh}_{2}\right)_{2}\right\}\right] \mathrm{Sb} \mathrm{F}_{6}$

$\mathrm{RuBr}_{2}(\mathrm{CO})\left[=\mathrm{C}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PPh}_{2}\right)_{2}\right](200 \mathrm{mg})$ and $\mathrm{AgSbF}_{6}(90 \mathrm{mg})$ were dissolved in acetonitrile ( 30 ml ) and the mixture was stirred for 20 min . The bright orange solution was then filtered through Celite to remove AgBr . Isopropanol ( 30 ml ) was added and the volume reduced under reduced pressure to yield a solid product which was recrystallised from $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ isopropanol to give orange crystals ( 170 mg , 69\%). Anal. Found: C, 46.05; H, 3.46; $\mathrm{Br}, 7.57 . \mathrm{C}_{40} \mathrm{H}_{31} \mathrm{BrF}_{6} \mathrm{NOP}_{2} \mathrm{RuSb} .\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)_{0.25}$ (solvent apparent in ${ }^{1} \mathrm{H}$ NMR) calcd.: $\mathrm{C}, 46.43 ; \mathrm{H}, 3.05 ; \mathrm{Br}, 7.67 \%$.
$\left[\overrightarrow{\mathrm{RuBr}(\mathrm{CO})_{2}\left(=\mathrm{C}\left(\mathrm{C}_{6} \mathrm{H}_{4} P P h_{2}\right)_{2}\right\} / \mathrm{SbF}_{6} .}\right.$
$\mathrm{RuBr}_{2}(\mathrm{CO})\left[=\mathrm{C}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PPh}_{2}\right)_{2}\right](200 \mathrm{mg})$ and $\mathrm{AgSbF}_{6}(90 \mathrm{mg})$ were added to frozen $\mathrm{CH}_{2} \mathrm{Cl}_{2}(40 \mathrm{ml})$ in a Fisher-Porter pressure bottle ( 500 ml capacity) under a CO pressure of 28 psi . The mixture was warmed to room temperature, stirred for 10 min , and filtered through Celite to remove AgBr. The solvent was removed under vacuum to yield an orange oil ( $190 \mathrm{mg}, 78 \%$ ), which resisted all attempts at crystallisation. This oil was used in the preparations below.

## $\stackrel{\operatorname{RuBr}(\mathrm{CO})_{2}\left[\mathrm{CH}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PPh}_{2}\right)_{2}\right]}{ }$

To a solution of freshly prepared $\left[\overline{\left.\mathrm{RuBr}(\mathrm{CO})_{2}\left\{=\mathrm{C}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PPh}_{2}\right)_{2}\right\}\right\} \mathrm{SbF}_{6}(250 \mathrm{mg})}\right.$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(30 \mathrm{ml})$ was added dropwise a solution of $\mathrm{NaBH}_{4}(15 \mathrm{mg})$ in EtOH ( 15 $\mathrm{ml})$. n -Hexane ( 40 ml ) was then added, whereupon a yellow oil containing $\mathrm{NaSbF}_{6}$ and $\mathrm{RuBr}(\mathrm{CO})_{2}\left[\mathrm{C}(\mathrm{OEt})\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PPh}_{2}\right)_{2}\right]$ formed. This was removed by filtration through Celite and the volume of the colourless filtrate was reduced to ca. 1 ml , when white crystals of the product formed ( $69 \mathrm{mg}, 37 \%$ ). M.p. $226-228^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$ ): $\delta, 5.51, \mathrm{~s}, 1 \mathrm{H}, \mathrm{C}-H ; \delta, 7.10-8.05, \mathrm{~m}, 28 \mathrm{H}$, aromatic Hs. #### Abstract

$\widehat{\left.\mathrm{RuBr}(\mathrm{CO})_{2} / \mathrm{C}\left(\mathrm{NEt}_{2}\right)\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PPh}_{2}\right)_{2}\right]}$ Diethylamine was added dropwise to a solution of $\left[\mathrm{RuBr}(\mathrm{CO})_{2}\left\{=\mathrm{C}\left(\mathrm{C}_{6} \mathrm{H}_{4}-\right.\right.\right.$ $\left.\left.\left.\mathrm{PPh}_{2}\right)_{2}\right\}\right] \mathrm{SbF}_{6}(20 \mathrm{mg})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ until the orange colour of the solution was discharged. The solution was then reduced in volume to ca. 5 ml and transferred to a $10 \times 3 \mathrm{~cm}$ silica-gel chromatography column. Elution with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ gave a yellow band, the solid from which was recrystallized from $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ cyclohexane to give pale-yellow crystals ( $127 \mathrm{mg}, 76 \%$ ). M.p. $>250^{\circ} \mathrm{C}$. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta, 1.20, \mathrm{t}$, $\mathrm{N}-\mathrm{CH}_{2}-\mathrm{CH}_{3} ; \delta, 3.52, \mathrm{q}, \mathrm{N}-\mathrm{CH}_{2}-\mathrm{CH}_{3}, J(\mathrm{HH}) 6 \mathrm{~Hz} ; \delta, 7.20-7.85, \mathrm{~m}, 28 \mathrm{H}$, aromatic Hs. Anal. Found: C, 61.33; H, 5.23. $\mathrm{C}_{43} \mathrm{H}_{38} \mathrm{BrNO}_{2} \mathrm{Ru}$ calcd.: $\mathrm{C}, 61.21 ; \mathrm{H}$, 4.54\%.

## X-Ray crystallography

Dark orange-red crystals of $\mathrm{RuBr}(\mathrm{CO})\left[=\mathrm{C}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{PPh}_{2}\right)_{2}\right]$ were obtained from THF/EtOH as small tablets, and that selected for the diffractometer measured $0.175 \times 0.10 \times 0.06 \mathrm{~mm}$. Systematic absences from the monoclinic diffraction pattern ( $h k l$ when $h+k=2 n+1$, and $h 0 l$ when $l=2 n+1$ ) were consistent with space groups $C c$ or $C 2 / c$. The structure was satisfactorily solved and refined in space-group $C 2 / c$. Unit cell dimensions were derived from least-squares fits to the observed setting angles of twenty-five reflections in the theta range 11.9 16.9 ${ }^{\circ}$ using graphite monochromated Mo- $K_{\alpha}$ radiation with a Nonius CAD-4 diffractometer.

Crystal data. $\mathrm{C}_{38} \mathrm{H}_{28} \mathrm{Br}_{2} \mathrm{OP}_{2} \mathrm{Ru}, \mathrm{M}$ 823.48, monoclinic, a 18.985(4), b 9.937(1), $c$ $21.171(2) \AA, \beta 123.80(1)^{\circ}, V 3319.2 \AA^{3}, D_{c} 1.648 \mathrm{~g} \mathrm{~cm}^{-3}, Z 4, F(000) 1631.98$, Mo-K $K_{\alpha} \lambda 0.7107 \AA$, graphite monochromator, $\mu 31.40 \mathrm{~cm}^{-1}$.

Intensity data collection employed the $2 \theta / \omega$ scan technique with a total background/peak count time ratio of $1 / 2$. The omega scan angle was $0.80+0.35 \tan \theta$. Reflections were counted for either 60 s or else until $\sigma(I) / I$ was $0.020 .(\sigma(I)=$ $20.1166 / N P I \sqrt{C+4 B}$, where the constant term is the maximum possible scan rate, $N P I$ is the ratio of the maximum possible scan rate for the measurement, $C$ is total
counts, $B$ is total background). Crystal alignment and possible decomposition were monitored throughout the data collection by remeasuring three selected standard reflections after every 100 measurements, but no non-statistical variations were observed. Data were collected to the practical diffraction limit of $\theta=26^{\circ}$. The data were corrected for Lorentz, polarisation and absorption effects (max. and min. transmission coefficient 0.9638 and 0.8968 , respectively) to yield 1974 unique observed reflections ( $I>2.5 \sigma(I)$ ). Computing was carried out using the SDP suite of programs on a PDP-11 for initial data processing, and SHELX-76 on an IBM 4341 computer for structure solution and refinement.

## Structure determination and refinement

The structure was solved by using conventional heavy-atom Patterson and electron density maps. The molecule is positioned about a crystallographic diad axis which passes through one bromine, the ruthenium, and the carbene carbon. The second bromine is statistically interchanged across the diad axis with the carbonyl ligand. The model refined has one half of a bromine and one half of a carbonyl on each side of the axis. The carbonyl atoms could not be individually resolved because of the overlap in difference Fourier maps with the bromine, and hence they were constrained into likely positions and assigned fixed isotropic temperature factors. The bromine position and isotropic temperature factor were refined however. The

[^1]ruthenium and the bromine on the diad axis were assigned anisotropic thermal parameters, and all carbon atoms were assigned individual isotropic temperature factors. No attempts were made to locate hydrogen atoms.

Refinement was by full-matrix least-squares procedures minimising the function $\sum w\left(\left|F_{\mathrm{o}}\right|-\left|F_{\mathrm{c}}\right|\right)^{2}$. Atomic scattering factors and dispersion corrections were for neutral atoms. At convergence, $R$ and $R_{w}\left(\left\{\sum w\left(\left|F_{o}\right|-\left|F_{c}\right|\right)^{2} / \sum w\left|F_{\mathrm{o}}\right|^{2}\right\}^{1 / 2}\right)$ were 0.060 and 0.063 , respectively. Reflection weights in the final cycle were $w=2.047 /\left(\sigma^{2}(F)+6.76 \times 10^{-4} F^{2}\right)$.

Final atomic coordinates are listed in Table 3. The molecular geometry and atomic numbering scheme are shown in Fig. 1. A complete list of bond lengths and angles, and tables of observed and calculated structure factor amplitudes are available on request from the authors (G.R.C).

## Acknowledgments

We thank Dr. Simon V. Hoskins who developed the synthesis of the key starting material, $\mathrm{Ru}\left(\mathrm{CF}_{3}\right) \mathrm{Br}(\mathrm{CO})_{2}\left(\mathrm{PPh}_{3}\right)_{2}$, and the N.Z. Universities Grants Committee for grants towards the purchase of instrumental facilities.
