#### Abstract

The formate complexes $\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})\left(\mathrm{RC}=\mathrm{CHR}^{\prime}\right)\left(\mathrm{PPh}_{3}\right)_{2}$ have been obtained in qantitative yield from the reaction of the unsaturated complexes $\mathrm{Ru}(\mathrm{CO}) \mathrm{Cl}\left(\mathrm{RC}=\mathrm{CHR}^{\prime}\right)\left(\mathrm{PPh}_{3}\right)_{2}$ with sodium formate in $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}$ mixtures. The synthesized complexes contain the formate ligand $\eta^{2}$-coordinated to metal. The structure of the complex $\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})(\mathrm{HC}=\mathrm{CHPh})\left(\mathrm{PPh}_{3}\right)_{2}$ has been established by an X-ray diffraction study. The molecule consist of an distorted octahedral ruthenium atom coordinated by two $\mathrm{PPh}_{3}$ ligands in the axial positions and the other ligands in the equatorial plane. The $\eta^{2}$-coordinated formate ligand is not symmetric, and has $\mathrm{C}-\mathrm{O}$ distances of $1.21(2)$ and $1.43(2) \dot{\mathrm{A}}$.

## Introduction

The unsaturated 16-electron complexes $\mathrm{Ru}(\mathrm{CO}) \mathrm{Cl}\left(\mathrm{RC}=\mathrm{CHR}^{\prime}\right)\left(\mathrm{PPh}_{3}\right)_{2}$ obtained by reaction of $\mathrm{RuH}(\mathrm{CO}) \mathrm{Cl}\left(\mathrm{PPh}_{3}\right)_{3}$ and alkynes [1-3] are very reactive toward alkynes [1], CO [4], $\mathrm{CN}^{\text {' }} \mathrm{Bu}$ [5], $\mathrm{CS}_{2}$ [6], 3.5-dimethylpyrazole [7] and carboxylates [8] to give six-coordinated ruthenium(II) complexes. The reaction with alkynes, CO , $\mathrm{CN}^{\mathrm{t}} \mathrm{Bu}$ and $\mathrm{CS}_{2}$ leads to coupling with the alkenyl group through $\mathrm{C}-\mathrm{C}$ bond formation. The various complexes obtained from these reactions have been structurally characterized by X-ray diffraction studies, which have revealed that most of them have a trans disposition of the two phosphines except in the case of the products of the reaction with $\mathrm{CS}_{2}$.

The carboxylate complexes of ruthenium(II) are very interesting because of their recently reported catalytic activity in hydrogenation and hydroformylation of alkenes [9], and so some modification of the alkenyl ligand was expected when the chloride ligand was substituted by a carboxylate group in the $\mathrm{Ru}(\mathrm{CO}) \mathrm{Cl}-$ $\left(\mathrm{RC}=\mathrm{CHR}^{\prime}\right)\left(\mathrm{PPh}_{3}\right)_{2}$ complexes. Unfortunately, the complexes $\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CR}^{\prime \prime}\right)(\mathrm{CO})$ $\left(\mathrm{CR}=\mathrm{CHR}^{\prime}\right)\left(\mathrm{PPh}_{3}\right)_{2}$ formed had the carboxylate group $\eta^{2}$-symmetrically coordi-
nated to metal and the alkenyl ligand unchanged. The easy substitution of the chlorine by carboxylates in $\mathrm{Ru}(\mathrm{CO}) \mathrm{Cl}\left(\mathrm{RC}=\mathrm{CHR}^{\prime}\right)\left(\mathrm{PPh}_{3}\right)_{2}$ complexes prompted us to examine their reactions with the formate anion. The formate complexes are of importance because of their relevance to the carbon dioxide chemistry, and yet have been little studied [10]. Furthermore, the acidic nature of the formate hydrogen offers another reaction site in the molecule toward the alkenyl ligand and alkynes. We describe have the reactions of the $\mathrm{Ru}(\mathrm{CO}) \mathrm{Cl}\left(\mathrm{RC}=\mathrm{CHR}^{\prime}\right)\left(\mathrm{PPh}_{3}\right)_{2}$ complexes with the formate anion, And the reactions of some formate derivative with terminal alkynes $\mathrm{HC} \equiv \mathrm{CR}^{\prime \prime}\left(\mathrm{R}^{\prime \prime}={ }^{\mathrm{t}} \mathrm{Bu}\right.$ and Ph ).

## Results and discussion

When a $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution of the $\mathrm{Ru}(\mathrm{CO}) \mathrm{Cl}\left(\mathrm{RC}=\mathrm{CHR}^{\prime}\right)\left(\mathrm{PPh}_{3}\right)_{2}$ complexes is treated with a MeOH solution of sodium formate new yellow crystalline products are obtained in a quantitative yield. These products are stable to air and soluble in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ but insoluble in petroleum ether and alcohols. Suitable crystals for X-ray diffraction studies were grown from in $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}$ solutions of mixtures of products. All the complexes were identified by IR and ${ }^{1} \mathrm{H}$ NMR spectroscopy and from their, C and H elemental analyses, which reveal that there has been introduction of a formate ligand into the complexes with loss of a chlorine atom.

The IR spectra of complexes recorded with KBr pellets show strong absorptions at $1529-1555 \mathrm{~cm}^{-1}$ and $1352-13689 \mathrm{~cm}^{-1}$ corresponding to $\nu(O C O)$ vibrations. The difference between the positions of the two $\nu(\mathrm{OCO})$ bands in the IR spectra has a value of $\approx 185 \mathrm{~cm}^{-1}$ and is indicative of a $\eta^{2}$-coordination through the oxygens of the formate ligand to ruthenium [11]. The $\nu(\mathrm{C} \equiv \mathrm{O})$ band appears at 1906-1934 $\mathrm{cm}^{-1}$. The higher $\boldsymbol{\nu}(\mathrm{C} \equiv \mathrm{O})$ values are observed for complexes with an alkenyl ligand bearing electron-withdrawing groups which lower the electron density at ruthenium centre. Lower $\nu(\mathrm{C} \equiv \mathrm{O})$ bands arise from complexes containing an alkenyl ligand bearing inductive groups ( $\mathrm{Me},{ }^{\mathrm{t}} \mathrm{Bu}$ and $\mathrm{SiMe}_{3}$ ). The positions of the $\nu(\mathrm{C} \equiv \mathrm{O})$ band in the new complexes is very similar to those for the acetate and 3,3-dimethylacrylate complexes previously described [8]. The $\nu(\mathrm{C}=\mathrm{C})$ absorption is often obscured by the formate bands, but is observed at $1508-1595 \mathrm{~cm}^{-1}$ in some complexes.

The ${ }^{1} \mathrm{H}$ NMR of complexes show the signals of the coordinated ligands. The formate hydrogen appears at $\approx 7 \mathrm{ppm}$ as a singlet for all the complexes [12]. The spectra of complexes containing a terminal alkenyl group display the $-\mathrm{CH}=$ proton at $6.2-9.6 \mathrm{ppm}$ and the $=\mathrm{CHR}$ hydrogen at $4.6-5.7 \mathrm{ppm}$ as a doublet with $J(\mathrm{H}-\mathrm{H})=12-18 \mathrm{~Hz}$ characteristic of a trans disposition of hydrogens. as in the related acetate and 3,3-dimethylacrylate derivatives [8]. The signals of the alkenylic protons are large, hindering the exact determination of the $J(\mathrm{H}-\mathrm{P})$ values. The approximate $\mathrm{H}-\mathrm{P}$ coupling constants for the alkenylic hydrogens in the formate complexes are: $J\left(\mathrm{H}_{\alpha}-\mathrm{P}\right)=2 \mathrm{~Hz}$ and $J\left(\mathrm{H}_{\beta}-\mathrm{P}\right)=1.3 \mathrm{~Hz}$. The formate complexes show an upfield shift of the $-\mathrm{C}=$ protons and a downfield shift of the $=\mathrm{CHR}$ hydrogens relative to the corresponding position signals in the ${ }^{1} \mathrm{H}$ NMR spectra of $\mathrm{Ru}(\mathrm{CO}) \mathrm{Cl}\left(\mathrm{RC}=\mathrm{CHR}^{\prime}\right)\left(\mathrm{PPh}_{3}\right)_{2}$ compounds. The signals of the alkenyl hydrogens in the complexes containing a disubstituted alkenyl ligand are appear between 4.3 and 5.3 ppm . The spectroscopic similarity of the formate derivatives to other carboxylate complexes containing an alkenyl ligands are indicative of a similar electronic effect
in the molecules. The geometry of the alkenyl ligands in the formate complexes is also similar to that in the starting complexes.

All analytical and spectroscopic data suggest that the structure of the synthesized

complexes consist of a ruthenium atom coordinated to an $\eta^{2}$-formate, an $\eta^{1}$-alkenyl, CO and two $\mathrm{PPh}_{3}$ ligands. Table 1 shows the spectroscopic data for the new complexes. The crystal structures of related carboxylate complexes have shown that the two $\mathrm{PPh}_{3}$ ligands are in a trans position and the remaining ligands in an equatorial pseudoplane. Because of the structural interest of the formate ligand and the limited data on their ruthenium derivatives [13] and X-ray diffraction of $\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})(\mathrm{HC}=\mathrm{CHPh})\left(\mathrm{PPh}_{3}\right)_{2}$ was undertaken.

The structure of $\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})(\mathrm{HC}=\mathrm{CHPh})\left(\mathrm{PPh}_{3}\right)_{2}$
Table 2 lists selected bond lengths and angles. The structure of the molecule of $\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})(\mathrm{HC}=\mathrm{CHPh})\left(\mathrm{PPh}_{3}\right)_{2}$ is depicted in the Fig. 1. The atom coordinates are listed in Table 3. The crystal consists of discrete $\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})(\mathrm{HC}=\mathrm{CHPh})-$ $\left(\mathrm{PPh}_{3}\right)_{2}$ molecules held together by Van der Waals forces. The molecule can be described as consisting of a distorted octahedral ruthenium atom coordinated by two $\mathrm{PPh}_{3}$ in a trans position and by one molecule of CO , an $\eta^{1}-2$-phenylethenyl, and an $\eta^{2}$-formate ligand in an equatorial plane. The angle formed by the two phosphines and the ruthenium is $175.3(1)^{\circ}$. The ruthenium-phosphorus distances are slightly different ( $\mathrm{Ru}-\mathrm{P} 1$; 2.414(5) $\AA$ and $\mathrm{Ru}-\mathrm{P} 2: 2.395(5) \AA$ ) and comparable to such bonds in related complexes [8]. The formate ligand is assymetrically $\eta^{2}$-coordinated to ruthenium, with $\mathrm{Ru}-\mathrm{O} 2$ and $\mathrm{Ru}-\mathrm{O} 3$ distances of 2.278(7) and 2.370 (7) $\AA$ respectively. The shorter distance corresponds to the $\mathrm{Ru}-\mathrm{O} 2$ bond trans ligand is that the two $\mathrm{C}-\mathrm{O}$ distances are different. The $\mathrm{O} 2-\mathrm{C} 2$ bond has a length of $1.21(2) \AA$ and the $\mathrm{O} 3-\mathrm{C} 2$ bond are of $1.43(2) \AA$. From these values is seems that the electronic density is not symmetrically distributed over the coordinated ligand. Thus, the $\mathrm{O} 2-\mathrm{C} 2$ bond can be considered as double, whereas the $\mathrm{O} 3-\mathrm{C} 2$ bond has a

Fig. 1. The molecular structure of $\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})(\mathrm{HC}=\mathrm{CHPh})\left(\mathrm{PPh}_{3}\right)_{2}$.
length expected for a single $\mathrm{C}-\mathrm{O}$ bond. The coordination of the formate ligand to ruthenium can be represented as:

The slight difference in length between the $\mathrm{Ru}-\mathrm{O}$ bonds is probably caused by trans position of the $\pi$-acceptor CO ligand to the $\mathrm{Ru}-\mathrm{O} 2$ bond inducing $\pi$-interactions between the $p_{\pi}$ system of the carboxylate and a filled metal $d_{\pi}$ orbital, as suggested previously [14]. The $\mathrm{O} 2-\mathrm{C} 2-\mathrm{O} 3$ angle is $112.4(1)^{\circ}$, as, in other $\eta^{2}$-carboxylate complexes. This angle gives rise to the small $\mathrm{O} 2-\mathrm{Ru}-\mathrm{O} 3$ angle of $56.64(3)^{\circ}$, which modifies the remaining equatorial angles around the ruthenium atom ( $\mathrm{O} 2-\mathrm{Ru}-\mathrm{C} 3$ : $70.8(3)^{\circ}, \mathrm{C} 3-\mathrm{Ru}-\mathrm{C1}: 118.3(4)^{\circ}$ and $\mathrm{C} 1-\mathrm{Ru}-\mathrm{O} 3: 118.3(4)^{\circ}$ ). The $\mathrm{C} 1-\mathrm{O} 1$ distance is $1.13(2) \AA$, and is found for related ruthenium complexes [8]. The 2-phenylethenyl ligand is $\eta^{1}$ bonded to metal with a C3-Ru distance of $2.036(8) \AA$, identical to the corresponding distance in the $\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CMe}\right)(\mathrm{CO})(\mathrm{CH}=\mathrm{CHPh})\left(\mathrm{PPh}_{3}\right)_{2}$ [8]. The phenylethenyl ligand lies in a plane, and the C3-C4 double bond length is $1.35(1) \AA$.

Reaction of $\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})(\mathrm{HC}=\mathrm{CHPh})\left(\mathrm{PPh}_{3}\right)_{2}$ complexes with $\mathrm{HC} \equiv \mathrm{CR}$ alkynes
The complex $\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})(\mathrm{HC=}=\mathrm{CHPh})\left(\mathrm{PPh}_{3}\right)_{2}$ reacts with an excess of $H C=C R\left(R={ }^{t} \mathrm{Bu}\right.$ and $\mathrm{SiMe}_{3}$ ) alkynes in an equimolar mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and MeOH at room temperature, and within 4 hours the $-\mathrm{CH}=\mathrm{CHPh}$ group has been completely replaced by a $-\mathrm{CH}=\mathrm{CHR}\left(\mathrm{R}={ }^{\mathrm{t}} \mathrm{Bu}\right.$ and $\mathrm{SiMe}_{3}$ ) ligand but the formate

ligand has been maintained. Thus, after the reaction of $\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})$ $(\mathrm{HC}=\mathrm{CHPh})\left(\mathrm{PPh}_{3}\right)_{2}$ with $\mathrm{HC} \equiv \mathrm{CSiMe}_{3}$ the complex $\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})$ $(\mathrm{HC}=\mathrm{CHSiMe} 3)\left(\mathrm{PPh}_{3}\right)_{2}$ was identified by IR and ${ }^{1} \mathrm{H}$ NMR spectroscopy and was isolated in a quantitative yield. The reaction of the same complex with $\mathrm{HC} \equiv \mathrm{C}^{1} \mathrm{Bu}$ produced a compound with an IR spectrum very similar to that of $\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})\left(\mathrm{HC}=\mathrm{CH}^{\mathrm{t}} \mathrm{Bu}\right)\left(\mathrm{PPh}_{3}\right)_{2}$ but the ${ }^{1} \mathrm{H}$ NMR spectrum showed two paris of doublets at $6.35(J=16 \mathrm{~Hz}), 6.30(J=16 \mathrm{~Hz}), 5.03(J=16 \mathrm{~Hz})$ and 4.98 $(J=16 \mathrm{~Hz}) \mathrm{ppm}$. Two of these sets of signals are coincident with those for the complex $\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})\left(\mathrm{HC}=\mathrm{CH}^{\mathrm{t}} \mathrm{Bu}\right)\left(\mathrm{PPh}_{3}\right)_{2}(6.30$ and 4.97 ppm$)$. The other two doublets must be attributed to an isomeric form of complex $\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})$ $\left(\mathrm{HC}=\mathrm{CH}^{\mathrm{t}} \mathrm{Bu}\right)\left(\mathrm{PPh}_{3}\right)_{2}$, probably that with the two $\mathrm{PPh}_{3}$ ligands cis to one another if it is assumed that the $J(\mathrm{H}-\mathrm{H})$ is 16 Hz for all the signals, a value indicative of a trans disposition of the alkenyl hydrogens [1,2]. The ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR of the mixture displays two signals, at 37.6 and 37.1 ppm , supporting our suggestion of the presence of two isomers with equivalent phosphines. The displacement of the alkenyl group in these reactions is reversible, and can be depicted as follows:

## Experimental

The ${ }^{1} \mathrm{H}$ NMR spectra were recorded on a Bruker AM 400 spectrometer at room temperature in $\mathrm{CDCl}_{3}$ solutions and are referenced to $\mathrm{SiMe}_{4}$. The ${ }^{1} \mathrm{H}$ decoupled ${ }^{31} \mathrm{P}$ NMR spectra were recorded on the same instrument in $\mathrm{CDCl}_{3}$ solutions with aqueous $85 \% \mathrm{H}_{3} \mathrm{PO}_{4}$ as external reference. The IR spectra were recorded on a Perkin-Elmer 1710-FT spectrometer with KBr pellets. The C and H elemental analyses were carried out with a Perkin-Elmer 240B analyzer.

All reactions were performed under a nitrogen atmosphere using Schlenk techniques. The complex $\mathrm{Ru}(\mathrm{CO}) \mathrm{Cl}\left(\mathrm{RC}=\mathrm{CHR}^{\prime}\right)\left(\mathrm{PPh}_{3}\right)_{2}$ were prepared by published methods [1-3].

## Preparation of complexes

To a 10 ml of a $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution of 0.2 g of $\mathrm{Ru}(\mathrm{CO}) \mathrm{Cl}\left(\mathrm{RC}=\mathrm{CHR}^{\prime}\right)\left(\mathrm{PPh}_{3}\right)_{2}$ was added a small excess of sodium formate in 5 ml of MeOH . The solution turned rapidly yellow. Stirring was maintained for 2 hours and solution was then evaporated to dryness and the residue dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The precipitate was filtered off, concentrated to a few ml, and petroleum ether added to precipitate the product. The products can be recrystallized from $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}$ mixtures.
$\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})\left(\mathrm{HC}=\mathrm{CH}_{2}\right)\left(\mathrm{PPh}_{3}\right)_{2}(\mathrm{I})$. Found: C, 66.30; $\mathrm{H}, 4.60 . \mathrm{C}_{40} \mathrm{H}_{34} \mathrm{O}_{3} \mathrm{P}_{\mathbf{2}} \mathrm{Ru}$ calc.: C, 66.20; H, 4.73\%.
$\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})\left(\mathrm{HC=} \mathrm{CHCMe}_{3}\right)\left(\mathrm{PPh}_{3}\right)_{2}$ (2). Found: $\mathrm{C}, 67.70 ; \mathrm{H}, 5.40$. $\mathrm{C}_{44} \mathrm{H}_{42} \mathrm{O}_{3} \mathrm{P}_{2} \mathrm{Ru}$ calc.: $\mathrm{C}, 67.59 ; \mathrm{H}, 5.43 \% .{ }^{31} \mathrm{P}$ NMR (ppm): 37.6(s).
$\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})(\mathrm{HC=CHSiMe} 3)\left(\mathrm{PPh}_{3}\right)_{2}$ (3). Found: C, 64.15; H, 5.60. $\mathrm{C}_{43} \mathrm{H}_{42} \mathrm{O}_{3} \mathrm{P}_{2}$ SiRu calc.: $\mathrm{C}, 64.72 ; \mathrm{H}, 5.32 \%$.
$\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})(\mathrm{HC}=\mathrm{CHPh})\left(\mathrm{PPh}_{3}\right)_{2}$ (4). Found: C, 69.00; H, 4.80. $\mathrm{C}_{46} \mathrm{H}_{38} \mathrm{O}_{3} \mathrm{P}_{2} \mathrm{Ru}$ calc.: $\mathrm{C}, 68.90 ; \mathrm{H}, 4.79 \% .{ }^{31} \mathrm{P}$ NMR (ppm): 37.5 (s).
$\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})(\mathrm{MeC}=\mathrm{CHMe})\left(\mathrm{PPh}_{3}\right)_{2} \quad$ (5). Found: C, 66.95; H, 5.90.
$\mathrm{C}_{42} \mathrm{H}_{38} \mathrm{O}_{3} \mathrm{P}_{2} \mathrm{Ru}$ calc.: $\mathrm{C}, 66.92 ; \mathrm{H}, 5.09 \%$.
$\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})(\mathrm{PhC}=\mathrm{CHPh})\left(\mathrm{PPh}_{3}\right)_{2} \quad$ (6). Found: C, 71.19; H, 4.80. $\mathrm{C}_{52} \mathrm{H}_{42} \mathrm{O}_{3} \mathrm{P}_{2} \mathrm{Ru}$ calc.: $\mathrm{C}, 71.19 ; \mathrm{H}, 4.83 \%$.
$\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})\left(\mathrm{HC}=\mathrm{CHCO}_{2} \mathrm{Me}\right)\left(\mathrm{PPh}_{3}\right)_{2}$ (7). Found: C, 64.30; H, 4.71. $\mathrm{C}_{42} \mathrm{H}_{36} \mathrm{O}_{5} \mathrm{P}_{2} \mathrm{Ru}$ calc.: $\mathrm{C}, 64.35, \mathrm{H}, 4.64 \%$.
$\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})\left(\mathrm{HC}-\mathrm{CHCO}_{2} \mathrm{Et}\right)\left(\mathrm{PPh}_{3}\right)_{2}$ (8). Found: C, 64.72; H, 4.79. $\mathrm{C}_{43} \mathrm{H}_{38} \mathrm{O}_{5} \mathrm{P}_{2} \mathrm{Ru}$ calc.: $\mathrm{C}, 64.74 ; \mathrm{H}, 4.77 \%$.
$\mathrm{Ru}\left(\mathrm{O}_{2} \mathrm{CH}\right)(\mathrm{CO})\left(\mathrm{MeO}_{2} \mathrm{CC}=\mathrm{CHCO}_{2} \mathrm{Me}\right)\left(\mathrm{PPh}_{3}\right)_{2}$ (9). Found: C, 62.80; H, 4.78. $\mathrm{C}_{44} \mathrm{H}_{38} \mathrm{O}_{7} \mathrm{P}_{2} \mathrm{Ru}$ calc.: $\mathrm{C}, 62.78 ; \mathrm{H}, 4.56 \%$.

## $X$-ray structure determination

The crystal data and experimental details for the structure determination, solution and refinement are given in Table 4. Accurate cell dimensions were determined by least-square analysis of setting angles of 26 automatically centered reflections in the range ( $10<\theta<26^{\circ}$ ) using graphite monochromated Mo- $K_{\alpha}$ radiation Enraf-

Table 4
Crystal data, data collection and structure refinement

| Crystal data |  |
| :---: | :---: |
| Formula | $\mathrm{C}_{46} \mathrm{H}_{38} \mathrm{O}_{3} \mathrm{P}_{2} \mathrm{Ru}$ |
| Crystal dimensions (mm) | $0.20 \times 0.27 \times 0.30$. |
| Symmetry | Monoclinic, Cc |
| Unit cell dimensions |  |
| $a, b, c(\AA)$ | 14.486(6), 14.101(7), 20.007(3) |
| $\alpha, \beta, \gamma\left({ }^{\circ}\right)$ | 90.00, 97.807(3), 90.00 |
| Packing |  |
| $V\left(\dot{A}^{3}\right), Z$ | 4048.9(3.1), 4 |
| $D_{\mathrm{c}}\left(\mathrm{g} \mathrm{cm}^{-3}\right), M, F(000)$ | 1.3154, 801, 1648 |
| $\mu\left(\mathrm{cm}^{-1}\right)\left(\mathrm{Mo}-\mathrm{K}_{a}\right)$ | 4.936 |
| Experimental data |  |
| Technique | Four circle Enraf-Nonius CAD-4 diffractometer |
| Scanning range for $\theta$ | $10<\theta<26^{\circ}$ |
| Number of reflexions: measured observed | $4700$ |
| Solution and refinement |  |
| Number of variables | 467 |
| Ratio of freedom | 7.96 |
| Degrees of freedom | 3253 |
| Final $R$ and $R_{w}$ | 5.0, 5.5\% |
| Weighting scheme | empirical as to give no trends in $\left\langle w \lambda^{2} F\right\rangle$ vs. $\left\langle F_{o}\right\rangle$ and $\langle\sin \theta / \lambda\rangle[16]$ |
| Computer and programs | VAX 11/750, XRAY-76 [17] |
| Scattering and programs | Ref. 18 |

Nonius on a CAD-4 diffractometer. Systematic absences were consistent with space group $C c$ and $C 2 / c$. Intensity data were collected with Mo- $K_{\alpha}$ radiation on an Enraf-Nonius CAD-4 diffractometer, two reflections were measured every hour to check crystal stability, and no significant variations were observed. Lorentz, polarization, and empirical absorption corrections were applied.

The structure was solved by direct methods (multan80 [15]) and the positions of the Ru and P atoms deduced from the electron density map. Successive difference Fourier synthesis and least squares refinement revealed the positions of the light atoms except $H$, and allowed exclusion of the alternative non-centrosymmetric space group Cc. H-atoms attached to C2, C3 and C4 were located from difference electron densities, but the protons on the aromatic rings were placed in calculated positions ( $\mathbf{C}-\mathrm{H}: 1.00 \AA$ ). All H -atoms were included with fixed-atom contributions with each given the isotropic temperature factor of its associated non-H atom.

A table of thermal parameters, a complete list of bond lengths and angles, and lists of structure factors are available from the authors
