#### Abstract

The synthetic utility of bis(trimethylstannyl)alkynyls in the preparation of Group 8 metal $\left(\mathrm{Fe}^{2+}, \mathrm{Ru}^{2+}, \mathrm{Os}^{2+}\right) \sigma$-acetylide monomeric, $\mathrm{M}(\mathrm{DEPE})_{2}\left(-\mathrm{C}=\mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2}\left(\mathrm{M}=\mathrm{Fe}^{2+}, \mathrm{Ru}^{2+}\right.$; DEPE $=1,2$-bis(diethylphosphinolethane), $\mathrm{Ru}(\mathrm{DPPE})_{2}\left(-\mathrm{C}=\mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2}$ (DPPE = 1,2-bis(diphenylphosphino)ethane), Os(DPPM) $\left(-\mathrm{CEC}-\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2}$ (DPPM = 1,2-bis(diphenylphosphino)methane) and polymeric, $\left[-\mathrm{M}(\mathrm{DEPE})_{2}-\mathrm{C} \equiv \mathrm{C}-\mathrm{R}-\mathrm{C} \equiv \mathrm{C}-\right]_{n}\left(\mathrm{M}=\mathrm{Fe}^{2+}, \mathrm{Ru}^{2+}\right)$, $\left[-\mathrm{Os}(\mathrm{DPPM})_{2}-\mathrm{C} \equiv \mathrm{C}-\mathrm{R}-\mathrm{C} \equiv \mathrm{C}-\right]_{n}\left(\mathrm{R}=p-\mathrm{C}_{6} \mathrm{H}_{4}-\mathrm{C}_{6} \mathrm{H}_{4}-p, p-\mathrm{C}_{6} \mathrm{H}_{4}, p-\right.$ $\mathrm{C}_{6} \mathrm{H}_{2}\left(\mathrm{CH}_{3}\right)_{2}$ ) complexes is demonstrated. The linear arrangement of the acetylenic units around octahedral metal centres is confirmed by a single crystal X-ray structure determination of the model complex trans-[Ru(DPPE) $\left.\mathbf{2}_{2}\left(-\mathrm{C}=\mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2}\right]$.

## 1. Introduction

Organic polymers with highly delocalized $\pi$-electrons (e.g. polyacetylene (1)) are good candidates in respect of properties such as third order nonlinear optical effects ( $\chi^{3}$ ) for possible applications in the materials industry [1]. Incorporation of transition metals into the conjugation backbone, as for example in transition metal $\sigma$-acetylide complexes (2), is expected to enhance these properties as well as increase their solubility in common organic solvents to facilitate processing to desired materials.

Such complexes were first synthesized for Group 10 metals ( $\mathrm{Ni}^{2+}, \mathrm{Pd}^{2+}$ and $\mathrm{Pt}^{2+}$ ) by Hagihara et al. [2], and were subsequently found [3] to exhibit third-order hyperpolarizabilities much higher than those of their

[^0]purely organic counterparts. The extent of conjugation in these rigid rod organometallic complexes may be tailored by introducing a wide variety of alkynes and transition metals in varying oxidation states. The original synthetic route of dehydrohalogenation (eqn. (1)) reported by Hagihara and co-workers [2] has its limitations since the metal halide complexes other than those of $\mathrm{Pt}^{2+}$ and $\mathrm{Pd}^{2+}$ are unstable in the amine solvents. We have recently developed [4] a new synthetic procedure which employs bis-trimethylstannyl-alkynes $\left(\mathrm{Me}_{3} \mathrm{Sn}-\mathrm{C} \equiv \mathrm{C}-\mathrm{R}-\mathrm{C} \equiv \mathrm{SnMe}_{3}\right.$ ) as precursors (eqn. (2)) for a variety of transition metal $\sigma$-acetylide complexes. In this contribution, we present an overview of our recent results on Group 8 transition metal-containing mono-, oligo- and polyyne organometallic complexes.

\end{align*}
$$

( $\mathrm{M}=\mathrm{Rh}, \mathrm{Ir}$ )
We were intrigued by the possibility of forming transition metal $\sigma$-alkyne oligomeric and polymeric complexes via the above reaction pathway starting from the appropriate bis-trimethylstannyl-alkynes and metal dihalides (eqn. (2)). This route proved to provide a very useful synthetic procedure for a variety of Group 9 and 10 metal $\sigma$-acetylide monomeric, oligomeric, and polymcric complexcs in excellent yields [4]. Since we were interested in examining the role of the metal (with square planar and octahedral environments) in determining the backbone conjugation in such complexes, we have now extended our procedure to include metals of Group $8\left(\mathrm{Fe}^{2+}, \mathrm{Ru}^{2+}, \mathrm{Os}^{2+}\right)$ in the linear organometallic chains.

Reaction of a slight excess of $\mathrm{Me}_{3} \mathrm{Sn}-\mathrm{C}=\mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{5}$ (1) with the metal dihalide complexes $\left(\mathrm{MCl}_{2}(\mathrm{DEPE})_{2}\right)$, $\mathbf{M}=\mathrm{Fe}^{2+}$ (2), $\mathrm{Ru}^{2+}(\mathbf{3}), \mathrm{RuCl}_{2}$ (DPPE) ${ }_{2}$ (4), $\mathrm{OsCl}_{2}-$ (DPPM) ${ }_{2}(5)$ in the presence of a catalytic amount of CuI (Scheme 1) gave the monomeric metal-bis-acetylide complexes, $\left[\mathrm{M}(\mathrm{DEPE})_{2}\left(-\mathrm{C} \equiv \mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2}\right]\left(\mathrm{M}=\mathrm{Fe}^{2+}(6)\right.$; $\mathrm{Ru}^{2+}$ (7)), $\left[\mathrm{Ru}(\mathrm{DPPE})_{2}\left(-\mathrm{C} \equiv \mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2}\right] \quad(8)$, $\left[\mathrm{Os}(\mathrm{DPPM})_{2}\left(-\mathrm{C} \equiv \mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2}\right](9)$ in good yields. The complex $\left[\mathrm{Fe}(\mathrm{DEPE})_{2}\left(-\mathrm{C}=\mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2}\right.$ ] was reported earlier, and was prepared from $\mathrm{Fe}(\mathrm{DEPE})_{2}(\mathrm{H})_{2}$ and phenylacetylene [6]. A similar bis(acetylide) complex of Ru-containing mixed auxiliary ligands on $\mathrm{Ru}^{2+}$, $\left[\mathrm{Ru}(\mathrm{CO})_{2}\left(\mathrm{PEt}_{3}\right)_{2}\left(-\mathrm{C}=\mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2}\right]$, was prepared recently by Carty et al. [7]. The polymeric complexcs, $\left[-\mathrm{M}(\mathrm{DEPE})_{2}-\mathrm{C} \equiv \mathrm{C}-\mathrm{R}-\mathrm{C} \equiv \mathrm{C}-\right]_{n} \quad\left(\mathrm{R}=p-\mathrm{C}_{6} \mathrm{H}_{2}\left(\mathrm{CH}_{3}\right)_{2}\right.$, $\mathrm{M}=\mathrm{Fe}^{2+}(13) ; \quad \mathrm{R}=p-\mathrm{C}_{6} \mathrm{H}_{4}-\mathrm{C}_{6} \mathrm{H}_{4}-p, \quad p-\mathrm{C}_{6} \mathrm{H}_{4}, \quad p-$ $\left.\mathrm{C}_{6} \mathrm{H}_{2}\left(\mathrm{CH}_{3}\right)_{2}\right), \quad \mathrm{M}=\mathrm{Ru}^{2+}$ (14-6); [-Os(DPPM) ${ }_{2}-$ $\mathrm{C}=\mathrm{C}-\mathrm{R}-\mathrm{C} \equiv \mathrm{C}-]_{n} \quad\left(\mathrm{R}=p-\mathrm{C}_{6} \mathrm{H}_{4}-\mathrm{C}_{6} \mathrm{H}_{4}-p, p-\mathrm{C}_{6} \mathrm{H}_{4}, p-\right.$ $\left.\mathrm{C}_{6} \mathrm{H}_{2}\left(\mathrm{CH}_{3}\right)_{2}\right)(17-19)$ were prepared by the reaction

Scheme 1.
of an equimolar quantity of the metal dihalide complex with the appropriate bis-trimethylstannyl-alkynyl reagent (10-12) in the presence of a catalytic amount of CuI. The role of CuI in such reactions is not yet very well understood and is under investigation in our laboratory. These transition metal $\sigma$-acetylide complexes (except 17) are soluble in common organic solvents, and were characterized from their analytical data, mass, ${ }^{31} \mathrm{P}$ nuclear magnetic resonance and infrared spectra. All-trans configuration of these compounds was clearly shown by the simple singlet pattern of their $\nu(\mathrm{C} \equiv \mathrm{C})$ IR and ${ }^{31} \mathrm{P}$ NMR spectra. The molecular weights of the

Fig. 1. Molecular structure of $\mathrm{Ru}(\mathrm{DPPE})_{2}\left(-\mathrm{C}=\mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2}$ (8). Hy drogen atoms are omitted for clarity.
polymers were determined by the gel permeation chromatography (GPC) method [8] and indicate a high degree of polymerization.

The molecular structure of trans-[Ru(DPPE) $\mathbf{2}_{2}(\mathrm{C}=\mathrm{C}-$ $\left.\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2}$ ] (8) is shown in Fig. 1. The atomic coordinates and selected bond parameters are listed in Tables 1 and 2 , respectively. The crystal structure consists of

discrete monomer molecules with the ruthenium atom coordinated in a trans disposition to two phenylacetylides and two chelating bis-(diphenylphosphino) ethane ligands. The metal to phosphorus bond length lie within the range 2.356 (2)-2.362(2) $\AA$ and metal to acetylide bond distances are 2.061(5) and 2.064(5) $\AA$. These values are in agreement with the other structurally characterized ruthenium(II) phosphine acetylide complex [7]. The coordination geometry of the metal centre does not exhibit any large deviation from that expected for a regular octahedral coordination, with angles between cis donor atoms ranging from 81.55(5) to $98.9(2)^{\circ}$ and those between trans atoms from 174.9(2) to $177.91(6)^{\circ}$. The acetylide $\mathrm{C} \equiv \mathrm{C}$ bonds have lengths of 1.207(7) and 1.194(7) $\AA$, and whilst these are in accord with those observed for a range of iron(II) and ruthenium(II) bis-acetylide complexes reported [6,7], there is a marginally larger distortion from linearity within the $\mathrm{C}-\mathrm{C}=\mathrm{C}, \mathrm{M}-\mathrm{C}=\mathrm{C}-\mathrm{C}$ chain of trans-[Ru(DPPE)$)_{2}(\mathrm{C} \equiv \mathrm{C}-$ $\left.\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2}$ ] than was observed previously [7]. This apparent deviation from linearity may possibly be attributable to steric pressure on the phenylacetylide ligands by the phenyl rings of the chelating phosphines.

In summary, we have prepared a series of rigid rod $\sigma$-acetylide complexes of $\mathrm{Fe}^{2+}, \mathrm{Ru}^{2+}$ and $\mathrm{Os}^{2+}$ and have structurally characterized the first example of a linear $\mathrm{Ru}^{\mathrm{II}}$-bis-chelating phosphine-bis-acetylide complex. The analysis of their physical properties to assess the degree of conjugation in the backbone of these complexes and its comparison with those for the corresponding complexes of Group 9 and 10 metals are currently being pursued.

## 3. Experimental details

All reactions were carried out under nitrogen by glove box or high vacuum line techniques. Solvents were predried and distilled from appropriate drying agents. NMR spectra were recorded on a Bruker AM400 spectrometer. ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ spectra were referenced to external trimethylphosphite and the ${ }^{1} \mathrm{H}$ spectra to solvent resonances. The IR spectra were recorded on a Perkin-Elmer 1710 Fourier Transform spectrometer. The molecular weights were determined by gel permeation chromatography (GPC) method. $\mathrm{Me}_{3} \mathrm{Sn}-\mathrm{C}=\mathrm{C}-$ $\mathrm{C}_{6} \mathrm{H}_{5}$ was prepared from phenylacetylene. Alkyne ligands ( $\mathbf{1 0} \mathbf{- 1 2 \text { ) were prepared by published procedures }}$ [9] with some minor modifications. $\mathrm{M}(\mathrm{DEPE})_{2} \mathrm{Cl}_{2}$ (M $=\mathrm{Fe}^{2+}, \mathrm{Ru}^{2+}$ ), $\mathrm{Ru}(\text { DPPE })_{2} \mathrm{Cl}_{2}, \mathrm{Os}(\text { DPPM })_{2} \mathrm{Cl}_{2}$ were prepared by published methods [10].

## 3.1. $X$-Ray data collection, structure solution and refinement summary for trans-[Ru(DPPE) $\left.2_{2}\left(\mathrm{C} \equiv C-C_{6} H_{5}\right)_{2}\right]$

The crystals for X -ray diffraction were grown by two-layer crystallization from a dichloromethane/ hexane ( $1: 1$ ) mixture.

### 3.1.1. Crystal data

$\mathrm{C}_{68} \mathrm{H}_{58} \mathrm{P}_{4} \mathrm{Ru}, M=1100.09$, triclinic, space group $P \overline{1}$ (No. 2), $a=10.793(2), b=12.532(3), c=22.231(5) \AA$, $\alpha=76.20(2), \quad \beta=76.89(2), \gamma=85.62(2)^{\circ}, \quad V=2843(1)$ $\AA^{3}, Z=2, D_{\mathrm{c}}=1.285 \mathrm{~g} \mathrm{~cm}^{-3}, F(000)=1140, \mu(\mathrm{Mo}-$ $\mathrm{K} \alpha)=0.43 \mathrm{~mm}^{-1}$.

A yellow rod shaped crystal of approximate dimensions $0.12 \times 0.18 \times 0.32 \mathrm{~mm}^{3}$ was mounted on a glass fibre and accurate lattice parameters were determined from 30 reflections ( $2 \theta=26.17-29.96^{\circ}$ ). Intensity data were measured on a Siemens R3mV diffractometer using monochromated Mo-K $\alpha$ radiation and $\omega$ scan mode to a maximum value for $2 \theta$ of $45^{\circ}$. Three standard reflections were monitored after every 97 reflections collected, and showed no significant decrease in intensity during the data collection time.

A total of 7948 reflections were measured within the range $0 \leq h \leq 11,-13 \leq k \leq 13,-23 \leq l \leq 23$ and averaged to yield 7470 unique reflections ( $R_{\text {int }}=0.046$ ) of which 5563 were judged as significant on the criterion $F_{\text {obs }}>4 \sigma\left(F_{\text {obs }}\right)$. Corrections for Lorentz and polarization effects were applied, and for absorption (min, max transmission $0.892,0.914$ ). Structure solution was by a combination of direct methods and Fourier techniques. Anisotropic thermal motion was assumed for all non-hydrogen atoms. Full-matrix least-squares refinement on $F_{0}{ }^{2}$ for all data and 669 parameters converged to $w R 2=0.111$ (all data), conventional $R=$ 0.042 (observed data), $(\Delta / \sigma)_{\text {max }}=0.001, \mathrm{GOF}=1.22$. The function minimized was $\Sigma w\left(F_{0}^{2}-F_{\mathrm{c}}^{2}\right)^{2}, w=1$ / $\left[\sigma^{2}\left(F_{\text {obs }}{ }^{2}\right)+(0.0301 P)^{2}+3.931 P\right]$ where $P=\left(F_{\mathrm{o}}{ }^{2}+\right.$ $\left.F_{\mathrm{c}}{ }^{2}\right) / 3$ and $\sigma$ was obtained from counting statistics. A final difference electron density Fourier synthesis revealed maximum and minimum residual electron density peaks of 0.40 and -0.66 e $\AA^{-3}$.

Additional crystallographic data including hydrogenatom coordinates, thermal parameters and full list of the bond parameters have been deposited with the Cambridge Crystallographic Data Centre. Lists of structure factors are available from the authors.

### 3.2. Syntheses

$\mathrm{Ru}(\mathrm{DEPE})_{2}\left(-\mathrm{C}=\mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2}$ (7). A mixture of trans$\mathrm{Ru}(\mathrm{DEPE})_{2} \mathrm{Cl}_{2}(0.058 \mathrm{~g}, 0.10 \mathrm{mmol}), \mathrm{Me}_{3} \mathrm{Sn}-\mathrm{C}=\mathrm{C}-$ $\mathrm{C}_{6} \mathrm{H}_{5}(0.120 \mathrm{~g}, 0.25 \mathrm{mmol})$ and $\mathrm{CuI}(5 \mathrm{mg})$ in toluene ( 50 ml ) was stirred under nitrogen at $80^{\circ} \mathrm{C}$ for 40 h . Toluene was then removed in vacuo and the product was isolated, after purification by column chromatogra-
phy on neutral grade I alumina using dichloromethane as eluant. Recrystallization from a dichloromethane/ hexane ( $1: 1$ ) mixture gave a dark yellow solid in $60 \%$ yield.
${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $\mathrm{CDCl}_{3}, 162 \mathrm{MHz}$ ): $95.4 \mathrm{ppm}(\mathrm{s})$. $\nu(\mathrm{C}=\mathrm{C})\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): 2054 \mathrm{~cm}^{-1}$. Mass spectrum ( +FAB , $m / z$ ) of parent ion: found 716; calcd. 715.8. Anal. Found $\mathrm{C}, 60.47$; $\mathrm{H}, 8.14 . \mathrm{C}_{36} \mathrm{H}_{58} \mathrm{P}_{4} \mathrm{Ru}$ calcd.: $\mathrm{C}, 60.40$; H, 8.14\%.

The other bis-acetylide complexes were prepared by following the same general procedure except that in the case of 8 , the reaction was carried out in dichloromethane instead of toluene.
$\mathrm{Fe}(\mathrm{DEPE})_{2}\left(-\mathrm{C}=\mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2}$ (6). Orange solid, $80 \%$ yield. ${ }^{31} \mathrm{P}\left({ }^{1} \mathrm{H}\right)$ NMR ( $\mathrm{C}_{6} \mathrm{D}_{6}, 162 \mathrm{MHz}$ ). 68.8 ppm (s). ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{C}_{6} \mathrm{D}_{6}, 400 \mathrm{MHz}$ ): 1.14 ( $\mathrm{s}, \mathrm{CH}_{3}$ ); 1.74, 2.44 ( s , $\mathrm{CH}_{2}$ ); 7.17, 7.59 (m, CH). $\nu(\mathrm{C} \equiv \mathrm{C})$ (Nujol): $2038 \mathrm{~cm}^{-1}$. Mass spectrum ( +FAB ) of parent ion: found 671; calcd. 670.6. Anal. Found C, 65.10; H, 8.79. $\mathrm{C}_{36} \mathrm{H}_{58} \mathrm{P}_{4} \mathrm{Fe}$ calcd.: C, 64.49; H, 8.66\%.
$\mathrm{Ru}\left(\mathrm{DPPE}_{2}\left(-\mathrm{C}=\mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2}\right.$ (8). Yellow solid, $45 \%$ yield. ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right.$ ) NMR ( $\mathrm{C}_{6} \mathrm{D}_{6}, 162 \mathrm{MHz}$ ): $88.0 \mathrm{ppm}(\mathrm{s})$. $\nu(\mathrm{C} \equiv \mathrm{C})\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) 2061 \mathrm{~cm}^{-1}$. Mass spectrum ( +FAB ) of parent ion: found 1100.1; calcd. 1100.1. Anal. Found C, 74.67; H, 5.19. $\mathrm{C}_{68} \mathrm{H}_{58} \mathrm{P}_{4} \mathrm{Ru}$ calcd.: C, 74.24; H, $5.31 \%$.
$\mathrm{Os}(\mathrm{DPPM})_{2}\left(-\mathrm{C} \equiv \mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2}$ (9). Yellow solid, $50 \%$ yield. ${ }^{31} \mathrm{P}\left({ }^{1} \mathrm{H}\right)$ NMR $\left(\mathrm{CDCl}_{3}, 162 \mathrm{MHz}\right): 195.0 \mathrm{ppm}(\mathrm{s})$. $\nu(\mathrm{C} \equiv \mathrm{C})\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) 2069 \mathrm{~cm}^{-1}$. Mass spectrum ( +FAB ) of parent ion: found 1161.2; calcd. 1161.2. Anal. Found C 68.91; H, 4.75. $\mathrm{C}_{66} \mathrm{H}_{54} \mathrm{P}_{4} \mathrm{Os}$ calcd.: C, 68.26; H, 4.69\%.
$\left[-\mathrm{Os}(\mathrm{DPPM})_{2}-\mathrm{C} \equiv \mathrm{C}-p-\mathrm{C}_{6} \mathrm{H}_{4}-\mathrm{C} \equiv \mathrm{C}-\right]_{n}$ (18). A solution of $\mathrm{Os}(\mathrm{DPPM})_{2} \mathrm{Cl}_{2}(0.2116 \mathrm{~g}, 0.2 \mathrm{mmole}), \mathrm{Me}_{3} \mathrm{Sn}-$ $\mathrm{C} \equiv \mathrm{C}-\mathrm{C}_{6} \mathrm{H}_{4}-\mathrm{C} \equiv \mathrm{C}-\mathrm{SnMe}_{3}(0.090 \mathrm{~g}, 0.2 \mathrm{mmol})$ and CuI $(5-6 \mathrm{mg})$ in toluene ( 60 ml ) was stirred at $105^{\circ} \mathrm{C}$ for 48 h. The mixture was then cooled to room temperature and passed through an alumina column with dichloromethane as eluant. The volume of dichloromethane eluant was reduced to 5 ml in vacuo to give the polymer in $70 \%$ yield. ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(\mathrm{CDCl}_{3}, 162\right.$ MHz ): $193.0 \mathrm{ppm}(\mathrm{s}) . \nu(\mathrm{C}=\mathrm{C})\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) 2064 \mathrm{~cm}^{-1}$. Anal. Found C, 66.94; H, 4.51. $\mathrm{C}_{60} \mathrm{H}_{48} \mathrm{OsP}_{4}$ calcd.: C , $66.53 ; \mathrm{H}, 4.47 \% . M_{\mathrm{w}}=24754\left(n_{\mathrm{w}}=23\right.$ ).

The other polymeric complexes were prepared by the same general procedure.
$\left[-\mathrm{Fe}(\mathrm{DEPE})_{2}-\mathrm{C} \equiv \mathrm{C}-p-\mathrm{C}_{6} \mathrm{H}_{2}\left(\mathrm{CH}_{3}\right)_{2}-\mathrm{C} \equiv \mathrm{C}-\right]_{n} \quad$ (13). Orange yellow solid, $60 \%$ yield. ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right)$ NMR ( $\mathrm{C}_{6} \mathrm{D}_{6}$, 162 MHz ): $69.0 \mathrm{ppm}(\mathrm{s}) .{ }^{1} \mathrm{H}$ NMR ( $\mathrm{C}_{6} \mathrm{D}_{6}, 400 \mathrm{MHz}$ ): 1.13 (s, $\mathrm{CH}_{3}$ ); 1.72 ( $\mathrm{s}, \mathrm{CH}_{2}$ ); 2.27 ( $\mathrm{s}, \mathrm{CH}_{3}$ ); 2.45 ( s , $\mathrm{CH}_{2}$ ); 7.41 (m, CH). $\nu(\mathrm{C} \equiv \mathrm{C})$ (Nujol) $2024 \mathrm{~cm}^{-1} . M_{\mathrm{w}}=$ $173,000\left(n_{w}=279\right)$.
$\left[-\mathrm{Ru}(\mathrm{DEPE})_{2}-\mathrm{C} \equiv \mathrm{C}-p-\mathrm{C}_{6} \mathrm{H}_{4}-\mathrm{C}_{6} \mathrm{H}_{4}-\mathrm{p}-\mathrm{C} \equiv \mathrm{C}-\right]_{n} \quad$ (14). Yellow solid, $45 \%$ yield. ${ }^{31} \mathrm{P}\left({ }^{1} \mathrm{H}\right) \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 162\right.$

MHz ): $95.55 \mathrm{ppm}(\mathrm{s}) . \nu(\mathrm{C}=\mathrm{C})\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) 2047 \mathrm{~cm}^{-1}$. Anal. Found C, $60.43 ; \mathrm{H}, 8.34 . \mathrm{C}_{36} \mathrm{H}_{56} \mathrm{RuP}_{4}$ calcd.: C , $60.43 ; \mathrm{H}, 7.87 \%$. $M_{\mathrm{w}}=28462$ ( $n_{\mathrm{w}}=40$ ).
$\left[-\mathrm{Ru}(\mathrm{DEPE})_{2}-\mathrm{C} \equiv \mathrm{C}-p-\mathrm{C}_{6} \mathrm{H}_{4}-\mathrm{C} \equiv \mathrm{C}-\right]_{n}$ (15). Yellow solid, $50 \%$ yield. ${ }^{31} \mathrm{P}\left({ }^{1} \mathrm{H}\right\}$ NMR (CDCl $1,162 \mathrm{MHz}$ ): $95.54 \mathrm{ppm}(\mathrm{s}) . \nu(\mathrm{C} \equiv \mathrm{C})\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) 2046 \mathrm{~cm}^{-1}$. Anal. Found C, 56.84; H, 8.31. $\mathrm{C}_{30} \mathrm{H}_{52}$ RuP ${ }_{4}$ calcd.: C, 56.50; $\mathrm{H}, 8.22 \% . M_{\mathrm{w}}=22468\left(n_{w}=35\right)$.
