#### Abstract

$1 \lambda^{3}, 3 \lambda^{3}$-Diphosphacyclobutadienes have been specifically generated for the first time through hexachloroethane-induced extrusion of the organophosphorus ligands from dimeric zirconocene-phosphaalkyne complexes. The species were chemically characterized indirectly by reactions with appropriate trapping reagents. Thus, the use of bis(acceptor)-substituted alkynes gave rise to 2,5 -diphosphabenzvalenes, whereas reactions with $N$-methylmaleinimide and donor-substituted alkynes such as bis(diethylamino)acetylene resulted in the formation of 1,3-diphospha-Dewar-benzenes. Representatives of both classes of compounds were analyzed by X-ray crystallography. Kinetically stabilized phosphaalkynes reacted similarly to furnish tetraphosphabishomoprismanes through a sequence of $[4+2]$ and $[2+2+2]$ cycloaddition processes. © 2002 Elsevier Science B.V. Keywords: Phosphaalkynes; 1,3-Diphosphacyclobutadienes; 1,3-Diphospha-Dewar-benzenes; Diphosphabenzvalenes; Cycloadditions

## 1. Introduction

Cyclobutadienes [1] and azacyclobutadienes [2] bearing sterically demanding substituents ('corset effect') are stable and, accordingly, have attained major significance in preparative chemistry. In contrast, the free $\lambda^{3}$-phospha- or $\lambda^{3}, \lambda^{3}$-diphosphacyclobutadienes are still unknown. Up to now only $\eta^{4}$-complexed 1,2- and 1,3-diphosphacyclobutadienes (1A [3] and 1B [4]) or 1,2,3-triphosphacyclobutadienes (1C [5]), together with compounds containing at least one five-coordinated phosphorus atom have been reported. Examples of the latter compounds are the 1,2-derivative 2 [6], the $1 \lambda^{5}, 3 \lambda^{5}$-diphosphacyclobutadienes 3 [7] and the tetraphosphete 4 [8].

2

3

4

We now report on the targeted generation and trapping reactions of 1,3 -diphosphacyclobutadienes. This has opened, for the first time, a broad access to the as yet only sparsely explored diphosphabenzene valence isomer system. 1,3-Diphosphacyclobutadienes were recently proposed as the decisive intermediates in the

[^0]specific, metal-initiated synthesis of tetraphosphacubanes $[9,10]$.

Thus, a plausible mechanistic explanation for the reaction of the dimeric tricyclic phosphaalkyne complex 5a with the mild halogenating agent involves the primary generation of the 1,3-diphosphacyclobutadiene (7a). The subsequent dimerization of the intermediate, which cannot be detected by spectroscopy, to the similarly not detectable tricyclic species $\mathbf{8}$ is followed by an
intramolecular [2+2] cycloaddition to afford the pentacyclic product 6 .

## 2. Results and discussion

The above mentioned results prompted the present work. In order to enable the chemical detection of the title compounds, we ensured that suitable trapping agents were present during the extrusion reaction of $\mathbf{5}$ with hexachloroethane [11]. At room temperature N methylmaleinimide (9) undergoes regioselective addition to the liberated 1,3-diphosphacyclobutadiene (7a) to afford the endo-tricyclic species $\mathbf{1 0}$ that can be isolated in the pure state by column chromatography and crystallization, albeit with a significant loss in yield. Elemental analyses and mass spectral data (Table 1) indicate that the adduct $\mathbf{1 0}$ is formed from one equivalent each of 1,3-diphosphacyclobutadiene (7a) and the $Z$-alkene 9 . The constitution of $\mathbf{1 0}$ was deduced from its NMR data. The ${ }^{31} \mathrm{P}-\mathrm{NMR}$ spectrum alone, showing two signals at $\delta=66.9(\mathrm{P} 1)$ and $\delta=425.0(\mathrm{P} 3)$ unequiv-

[^1]ocally demonstrates the structure of a 1,3-diphosphacyclobutene unit [12]. The endo-addition is clearly visible from the ${ }^{1} \mathrm{H}$-NMR data; the cis-position of proton H6 ( $\delta=2.62$ ) to the free electron pair at P 1 is evident from the large ${ }^{2} J(\mathrm{P}, \mathrm{H})$ coupling of 21.0 Hz [13]. The second skeletal proton H 5 gives a signal at $\delta=3.14$ with a characteristic splitting pattern. The skeletal carbon atoms C4, C5 and C6 gave signals with chemical shifts typical for a four-membered ring containing phosphorus ( $\delta=31.6-43.7$ ) $[4 \mathrm{e}, 12]$. The signal for the phosphaalkene carbon atom C 2 occurs at characteristic low field ( $\delta=232.1$ ) [14]. The two ${ }^{1} J(\mathrm{P}, \mathrm{C})$ coupling constants of 58.5 and 40.3 Hz confirm the proximity to P1 and P3.

13
14

The reaction with the ynediamine $\mathbf{1 1}$ as a trapping reagent for the liberated 1,3-diphosphacyclobutadiene (7a) proceeds selectively to afford the first member of the new class of 1,3-diphospha-Dewar-benzenes. The bicyclic compound $\mathbf{1 2}$ was isolated by bulb-to-bulb distillation in $47 \%$ yield. Surprisingly, a valence isomerization to furnish the corresponding 1,3-diphosphabenzene does not occur, even at $100-110^{\circ} \mathrm{C}$. The constitution of $\mathbf{1 2}$ is demonstrated by its NMR data. The presence of a 1,3-diphosphacyclobutene increment is shown by the ${ }^{31} \mathrm{P}$-NMR $[\delta=31.9$ ( P 1 ) and $\delta=329.9$ (P3)] and the ${ }^{13} \mathrm{C}$-NMR signals [ $\delta=43.1$ (C4) and $\delta=247.6(\mathrm{C} 2)]$. The $\mathrm{C}=\mathrm{C}$ double bond in 12 is recognized from the ${ }^{13} \mathrm{C}$-NMR signals of C 5 and C 6 at $\delta=136.2$ and 143.3. The oily consistency of the $1,3-$ diphospha-Dewar-benzene $\mathbf{1 2}$ does not allow an X-ray crystallographic analysis. Thus, in order to obtain a

Fig. 1. Structure of $\mathbf{1 4}$ in the crystal state (XP plot [26], thermal ellipsoids with $50 \%$ occupancy probability). Selected bond lengths ( $\AA$ ) and bond angles $\left(^{\circ}\right.$ ): W1-P1 2.578(2), W2-P3 2.516(2), P3-C2 1.680(9), C5-C6 1.354(12), P1-C2 1.840(9), P1-C4 1.874(8), P1-C6 $1.830(9), \mathrm{P} 3-\mathrm{C} 41.895(9), \mathrm{C} 4-\mathrm{C} 5$ 1.531(12); W2-P3-C2 135.9(3), W2-P3-C4 135.5(3), C2-P3-C4 88.5(3), C4-P1-C2 84.6(4), C4-P1-C6 75.7(4), P3-C2-P1 97.1(5), P1-C4-P3 89.0(4), C5-C4-P1 86.6(5), C5-C6-P1 93.8(7), C6-C5-C4 103.8(8).
crystalline derivative of $\mathbf{1 2}$, we allowed it to react with [W(CO) $)_{5}$ THF]. Irrespective of the stoichiometry, we always obtained a mixture of the two complexes $\mathbf{1 3}$ and 14. Both metal complexes are less sensitive to hydrolysis than the uncomplexed molecule $\mathbf{1 2}$ and can, thus, be separated by column chromatography. The coordination of the pentacarbonyltungsten fragments at P3 (13) or at P1 and P3 (14) is demonstrated by the respective ${ }^{183} \mathrm{~W}$ satellite signals in the ${ }^{31} \mathrm{P}$-NMR spectra (Table 1). An X-ray crystallographic analysis of the bis[W(CO) $)_{5}$ ] complex 14 obtained as the minor product impressively confirmed the 1,3-diphospha-Dewar-benzene structure (Fig. 1) [15]. At the same time it unambiguously proved the constitution of the new diphosphabenzene valence isomer 12. The bicyclic skeleton exhibits a pronounced folding along the P1-C4 axis; the two idealized planes defined by the atoms P1-C2-P3-C4 and P1-C4-C5-C6, respectively, intersect at an angle of $109.6^{\circ}$. The $\mathrm{P}-\mathrm{C}$ and $\mathrm{C}-\mathrm{C}$ single bond lengths are in the range $1.830(9)-1.895(9) \AA$ and around $1.531(12) \AA$, respectively, in good agreement with those of other polycyclic systems [16]. The P3-C2 bond length of $1.680(9) \AA$ shows that the phosphaalkene function is still intact after the $\eta^{1}$-complexation [14].

The presence of various bis(acceptor) substituted acetylenes $\mathbf{1 5}$ during the extrusion reaction of 5 with $\mathrm{C}_{2} \mathrm{Cl}_{6}$ does not result in diphospha-Dewar-benzenes. Instead, these reactions lead to the unexpected but selective formation of the new diphosphabenzvalenes 16 that can be isolated in yields of up to $65 \%$ by column chromatography.

The constitutions of the highly stable, colorless tricyclic compounds 16 were unequivocally demonstrated from their elemental analyses and their mass and NMR spectroscopic data (Table 1). This is illustrated below by the discussion of the NMR data for the product 16a. The two isochronous phosphorus nuclei P2 and P5 give a ${ }^{31} \mathrm{P}$-NMR signal at $\delta=-19.3$, an unusually low field for phosphiranes [17]. However, this value is in good harmony with that for the up to date only previously known diphosphabenzvalene [18]. In the ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectrum, the two chemically equivalent skeletal carbon atoms C 1 and C 6 give a signal at $\delta=109.6$, an unusual and dramatic shift to low field for a phosphacyclo-

Fig. 2. Structure of 16b in the crystal state (XP plot [26], thermal ellipsoids with $50 \%$ occupancy probability). Selected bond lengths ( $(\AA)$ and bond angles ( ${ }^{\circ}$ ): C1-P5 1.842(2), C6-P2 1.842(2), P2-C1 1.859(2), P2-C3 1.848(2), C1-C6 1.499(4), C3-C4 1.328(5); C6-P2-C1 47.78(10), C6-C1-P2 65.53(11), C3-P2-C1 98.04(9), P5-C1-P2 100.12(9), C4-C3-P2 114.11(7).
propane [17]. The direct adjacency to the two P atoms results in a triplet structure $\left({ }^{1} J(\mathrm{P}, \mathrm{C})=45.8 \mathrm{~Hz}\right)$. The signals of the two double-bonded carbon atoms ( $\mathrm{C}=\mathrm{C}$; $\delta=163.5$ and $\mathrm{C}=\mathrm{O} ; \delta=164.1$ ) appear as an $\mathrm{AXX}^{\prime}$ spin system that can be resolved by simulations (Table 1). It is then also possible to deduce a value of 12.0 Hz for the not directly measurable ${ }^{2} J(\mathrm{P}, \mathrm{P})$ coupling constants.

A suitable single crystal of the 1-adamantyl derivative $\mathbf{1 6 b}$ has also enabled the first ever crystallographic analysis of a diphosphabenzvalene to be made (Fig. 2) [19]. The standard criteria for characterizing a bicyclobutane system [20] are the folding angle between the planes of the two three-membered rings and the length of the bridging bond; in the case of $\mathbf{1 6 b}$ these were found to be $114^{\circ}$ and $1.499(4) \AA$, respectively. In spite of their incorporation in a tricyclic framework, the phosphirane units still show their typical geometric parameters [17], although the bond lengths P2-C1 (1.859(2) $\AA)$ and P2-C6 (1.848(2) A) do differ slightly. Also typical is the $\mathrm{C} 3=\mathrm{C} 4$ double bond length of $1.328(5) \AA$.

The kinetically stabilized phosphaalkyne $\mathbf{1 8}$ also undergoes a highly selective addition to the liberated 1,3-diphosphacyclobutadiene (7a). The primarily formed 1,3,5-triphospha-Dewar-benzene 19, however, cannot be detected but rather participates in a spontaneous, regioselective homo-Diels-Alder reaction with a further molecule of tert-butylphosphaacetylene (18) [21b]. This results in the construction of the tetraphosphabishomoprismane 21 as the final product isolated in $82 \%$ yield.

19
$P \equiv C-I B u$
$18 a$

20

21

The cage compound 21 is also accessible by another route [21]. Elimination of the Lewis acid from the spirocyclic betaine 20 by dimethyl sulfoxide in the presence of the phosphaalkyne $\mathbf{1 8}$ also leads to the formation of 21 [21a]. The intermediate existence of the 1,3,5-triphospha-Dewar-benzene 19 is, thus, also plausible in the present reaction and can be rationalized by a [1,2]-P shift subsequent to extrusion of $\mathrm{AlCl}_{3}$. The NMR data of the tetramer 21, prepared from 5a, are in excellent agreement with those reported in the literature [21a].

## 3. Experimental

General procedure for the preparation of $\mathbf{1 0}, \mathbf{1 2}, \mathbf{1 6}$, and 21: in a Schlenk pressure tube 5a or the analogous 1-adamantyl-zirconium complex $\mathbf{5 b}$ [ 9 b] is dissolved in an appropriate solvent [22]. At $25{ }^{\circ} \mathrm{C}$ the trapping reagent and $\mathrm{C}_{2} \mathrm{Cl}_{6}$ are added consecutively. After completion of the reaction ( ${ }^{31} \mathrm{P}-\mathrm{NMR}$ monitoring) volatile materials are evaporated at $25^{\circ} \mathrm{C} / 10^{-3} \mathrm{mbar}$, the residue is treated with $n$-pentane ( $4 \times 15 \mathrm{ml}$ ) and filtered through Celite ${ }^{\mathrm{TM}}$ (D3 glass sinter). The final product is isolated either by column chromatography on silica gel ( $63-200 \mu \mathrm{~m}$, heated for 16 h at $175{ }^{\circ} \mathrm{C}$ and $10^{-3}$ mbar, then deactivated with $4 \%$ Ar-saturated water) or by bulb-to-bulb distillation.

Amounts: 5a ( $250 \mathrm{mg}, 0.59 \mathrm{mmol}$ ), 9 ( $264 \mathrm{mg}, 2.37$ mmol ), $\mathrm{C}_{2} \mathrm{Cl}_{6}$ ( $168 \mathrm{mg}, 0.71 \mathrm{mmol}$ ) in 3 ml toluene; reaction time: 7 days; column chromatography: eluent $n$-pentane $-\mathrm{Et}_{2} \mathrm{O}$ (2:1), after removal of the solvent mixture at $25^{\circ} \mathrm{C} / 10^{-3} \mathrm{mbar}$ and recrystallization from $n$-pentane at $-30{ }^{\circ} \mathrm{C}$, lemon-yellow crystals of $\mathbf{1 0}$ are obtained. Yield: $11 \mathrm{mg}(6 \%)$.

### 3.2. 2,4-Ditert-butyl-N,N,N', $N^{\prime}$,-tetraethyl-1,3-diphos-phabicyclo[2.2.0]hexa-2,5-diene-5,6-diamine (12)

Amounts: 5a ( $469 \mathrm{mg}, 1.11 \mathrm{mmol}$ ), 11 [23] ( 560 mg , $3.33 \mathrm{mmol}), \mathrm{C}_{2} \mathrm{Cl}_{6}(394 \mathrm{mg}, 1.67 \mathrm{mmol})$ in $4 \mathrm{ml} \mathrm{CH}_{2} \mathrm{Cl}_{2}$; reaction time: 36 h ; bulb-to-bulb distillation ( $100-110^{\circ} \mathrm{C} / 10^{-3} \mathrm{mbar}$ ) furnishes $\mathbf{1 2}$ as a yellow oil. Yield: $192 \mathrm{mg}(47 \%)$.

### 3.3. Complexation of 12:

(2,4-ditert-butyl- $N, N, N, N^{\prime}, N^{\prime}$-tetraethyl-1,3-diphos-phabicyclo[2.2.0]hexa-2,5-diene-5,6-diamino-3-yl)pentacarbonyltungsten (13) and (2,4-ditert-butyl- $N, N, N, N^{\prime}, N^{\prime}-$ tetraethyl-1,3-diphosphabicyclo[2.2.0]hexa-2,5-diene-5,6-diamino-1,3-diyl)bi(pentacarbonyltungsten) (14)

To a solution of [ $\mathrm{W}(\mathrm{CO})_{5} \mathrm{THF}$ ] [24], prepared by irradiation of $\mathrm{W}(\mathrm{CO})_{6}(153 \mathrm{mg}, 0.43 \mathrm{mmol})$ in THF ( 50 $\mathrm{ml}), \mathbf{1 2}(80 \mathrm{mg}, 0.22 \mathrm{mmol})$ is added in THF ( 3 ml ). After 4 h the solvent is removed at $25^{\circ} \mathrm{C} / 10^{-3} \mathrm{mbar}$ and the residue is chromatographed on silica gel with $n$-pentane. The first zone contains the bis $\left[\mathrm{W}(\mathrm{CO})_{5}\right]$ complex 14 (yield: $13 \mathrm{mg}(6 \%)$, red needles) and the second zone the mono-complex 13 (yield: 25 mg ( $17 \%$ ), orange-red solid).
3.4. Dimethyl 1,6-ditert-butyl-2,5-diphospha[3.1.0.0 $0^{2,6}$ ]-hex-3-ene-3,4-dicarboxylate (16a)

Amounts: 5a ( $490 \mathrm{mg}, 1.16 \mathrm{mmol}$ ), 15a ( $827 \mathrm{mg}, 5.82$ $\mathrm{mmol}), \mathrm{C}_{2} \mathrm{Cl}_{6}(414 \mathrm{mg}, 1.75 \mathrm{mmol})$ in $4 \mathrm{ml} \mathrm{CH} 2 \mathrm{Cl}_{2}$; reaction time: 5 days; column chromatography: eluent $n$-pentane $-\mathrm{Et}_{2} \mathrm{O}$ (8:1), after removal of the solvent mixture ( $25{ }^{\circ} \mathrm{C} / 10^{-3} \mathrm{mbar}$ ) $\mathbf{1 6 a}$ is obtained as a colorless oil. Yield: $179 \mathrm{mg}(45 \%)$.

### 3.5. Dimethyl 1,6-di(1-adamantyl)-2,5-diphospha[3.1.0.0 ${ }^{2,6}$ hex-3-ene-3,4-dicarboxylate (16b)

Amounts: 5b ( $527 \mathrm{mg}, 0.91 \mathrm{mmol}$ ), 15b ( $648 \mathrm{mg}, 4.56$ mmol ), $\mathrm{C}_{2} \mathrm{Cl}_{6}$ ( $323 \mathrm{mg}, 1.37 \mathrm{mmol}$ ) in $4 \mathrm{ml} \mathrm{CH} \mathrm{Cl}_{2}$; reaction time: 6 days; column chromatography: eluent $n$-pentane $-\mathrm{Et}_{2} \mathrm{O}$ (10:1), after removal of the solvent mixture ( $25{ }^{\circ} \mathrm{C} / 10^{-3} \mathrm{mbar}$ ) $\mathbf{1 6 b}$ is obtained as a colorless solid. Yield: 172 mg ( $38 \%$ ).

### 3.6. Diethyl 1,6-ditert-butyl-2,5-diphospha- <br> [3.1.0.0 ${ }^{2,6}$ ]hex-3-ene-3,4-dicarboxylate (16c)

Amounts: 5a ( $250 \mathrm{mg}, 0.59 \mathrm{mmol}$ ), 15c ( $404 \mathrm{mg}, 2.37$ $\mathrm{mmol}), \mathrm{C}_{2} \mathrm{Cl}_{6}(163 \mathrm{mg}, 0.69 \mathrm{mmol})$ in $5 \mathrm{ml} \mathrm{CH} 2 \mathrm{Cl}_{2}$; reaction time: 6 days; column chromatography: eluent $n$-pentane $-\mathrm{Et}_{2} \mathrm{O}$ (first $150 \mathrm{ml} \mathrm{20:1}$, then $100 \mathrm{ml} 5: 1$ ), after removal of the solvent mixture $\left(25{ }^{\circ} \mathrm{C} / 10^{-3}\right.$ mbar) $\mathbf{1 6 c}$ is obtained as a colorless oil. Yield: 55 mg (25\%).

### 3.7. 1,6-Ditert-butyl-3,4-bis(trifluoromethyl)-2,5-diphospha[3.1.0.0 ${ }^{2,6}$ ]hex-3-ene (16d)

Amounts: 5a ( $243 \mathrm{mg}, 0.58 \mathrm{mmol}$ ), 15d ( $470 \mathrm{mg}, 2.90$ $\mathrm{mmol}), \mathrm{C}_{2} \mathrm{Cl}_{6}$ ( $206 \mathrm{mg}, 0.87 \mathrm{mmol}$ ) in $4 \mathrm{ml} \mathrm{CH} \mathrm{Cl}_{2}$; reaction time: 6 days; column chromatography: eluent $n$-pentane $-\mathrm{Et}_{2} \mathrm{O}$ (20:1), after removal of the solvent mixture ( $25{ }^{\circ} \mathrm{C} / 10^{-3} \mathrm{mbar}$ ) $\mathbf{1 6 d}$ is obtained as a colorless solid. Yield: 163 mg ( $65 \%$ ).

### 3.8. 2,3,5,8-Tetratert-butyl-1,4,6,7-tetraphosphatetracyclo[3.3.0.0 $0^{2,4} .0^{3,6}$ ]oct-7-ene (21)

Amounts: 5 a ( $220 \mathrm{mg}, 0.52 \mathrm{mmol}$ ), $18(104 \mathrm{mg}, 1.04$ $\mathrm{mmol}), \mathrm{C}_{2} \mathrm{Cl}_{6}$ ( $184 \mathrm{mg}, 0.78 \mathrm{mmol}$ ) in $3 \mathrm{ml} \mathrm{CH} \mathrm{Cl}_{2}$; reaction time: 2 days; after filtration through Celite ${ }^{\mathrm{TM}}$ and removal of the volatile materials at $25^{\circ} \mathrm{C} / 10^{-3}$ mbar 21 is obtained as a red oil; identification by comparison of its NMR data with those of an authentic sample [21a]. Yield: $171 \mathrm{mg}(82 \%)$.

## 4. Supplementary material

Crystallographic data for the structural analysis have been deposited with the Cambridge Crystallographic

Data Centre, CCDC nos. 174178 and 174179 for compounds 14 and $\mathbf{1 6 b}$, respectively. Copies of this information may be obtained free of charge from The Director, CCDC, 12 Union Road, Cambridge CB2 1EZ, UK (Fax: + 44-1223-336033; e-mail: deposit@ ccdc.cam.ac.uk or www: http://www.ccdc.cam.ac.uk).

## Acknowledgements

This work was supported by the Deutschen Forschungsgemeinschaft (Graduate College 'Phosphorus as Connecting Link Between Various Chemical Disciplines') and the Fonds der Chemischen Industrie (postgraduate grant to A.M.).

[22] The extrusion reaction of 5 with $\mathrm{C}_{2} \mathrm{Cl}_{6}$ occurs in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ about eight times more rapidly than in toluene. In order to avoid competing reactions (formation of 6) with less reactive trapping
reagents, a longer reaction time must be selected. This can be achieved by using toluene.
