#### Abstract

1-Carboxyl-1 $1^{\prime}, 2^{\prime}, 3^{\prime}, 4^{\prime}, 5^{\prime}$-pentamethylruthenocene was heated with $\left(\mathrm{CF}_{3} \mathrm{CO}\right)_{2} \mathrm{O}$ overnight at $90{ }^{\circ} \mathrm{C}$ to give anti-$8,9,10,11,12,20,21,22,23,24$-decamethyl $[1.1](2,18)(6,14)$ ruthenocenophan-1,13-dione in $52 \%$ yield, whose structure was determined by X-ray diffraction (XRD). Chlorocarbonylruthenocene was treated with anhydrous aluminum chloride in refluxing dichloroethane to give anti-[1.1](2,18)(6,14)ruthenocenophan-1,13-dione and $[1,1](2,20)(6,14)$ ruthenocenophan-1,13-dione, although, with a tiny yield ( $3 \%$ ). In the protonated species of two homoannularly bridged ruthenocenophanes the positive charge was partially delocalized. The structure of the protonated species was determined by XRD. $[1,1](2,20)(6,14)$ Ruthenocenophan-1,13-dione was fluxional and the activation energy ( $\Delta G^{\neq}=56.5 \mathrm{~kJ} \mathrm{~mol}^{-1}$ ) of the dynamic process was determined by the VT-method. © 2002 Elsevier Science B.V. Keywords: Ruthenocenophane; Dynamic process; Protonation; Indacen-4,8-dione

## 1. Introduction

Metallocenes are a noteworthy object of the research in fundamental and applied chemistry even today [1]. Of stable metallocene, ferrocene, ruthenocene, and osmocene, ferrocene derivatives are especially investigated from a variety of viewpoints, for example, functionality materials and catalysts, probably, because ferrocene has a unique structure and shows a stable one-electron redox behavior [2]. Recently, much attention has been also focused in the chemistry of ruthenocene, in particular, in binuclear ruthenocene derivatives. [1.1]Ruthenocenophane showed quasi-reversible two-electron redox and gave the complex with a $\mathrm{Ru}-\mathrm{Ru}$ bond in the oxidation [3]. The two-electron oxidation of 1,2-bis(ruthenocenyl)ethylenes afforded the ( $\mu-\eta^{6}, \eta^{6}$ pentafulvadiene)diruthenium complexes [4]. The $\mathrm{Ru}(\mathrm{II})$ ruthenocenylacetylide complexes showed two quasi-reversible one-electron waves in the cyclic voltammetry $(\mathrm{CV})$ and caused a unique structural rearrangement in the oxidation $[5,6]$. The two-electron oxidation of

[^0]biruthenocene led to the anti-( $\mu-\eta^{6}, \eta^{6}$-fulvalene) diruthenium complex with a novel coordination mode of a fulvalene ligand [7]. These interesting facts stimulate us to investigate binuclear ruthenocene derivatives further. We here report the synthesis and some properties of binuclear ruthenocene derivatives, which are bridged by two carbonyl groups homoannularly or heteroannularly.

## 2. Results and discussion

### 2.1. Synthesis, spectra, and molecular structure

1-Formyl-1', $2^{\prime}, 3^{\prime}, 4^{\prime}, 5^{\prime}$-pentamethylruthenocene was oxidized with $\mathrm{MnO}_{2}$ in the presence of KCN in MeOH to give 1 -carbomethoxy- $1^{\prime}, 2^{\prime}, 3^{\prime}, 4^{\prime}, 5^{\prime}$-pentamethylruthenocene (2) in $80 \%$ yield. The hydrolysis of the ester 2 in aqueous $10 \% \mathrm{KOH}$ solution afforded 1-carboxyl-1 $, 2^{\prime}, 3^{\prime}, 4^{\prime}, 5^{\prime}$-pentamethylruthenocene (3) in $90 \%$ yield. The carboxylic acid 3 was heated with $\left(\mathrm{CF}_{3} \mathrm{CO}\right)_{2} \mathrm{O}$ overnight at $90{ }^{\circ} \mathrm{C}$ to give anti-$8,9,10,11,12,20,21,22,23,24$-decamethyl $[1.1](2,18)(6,14)$ -

(1)

(4)

(7)

(8)

Scheme 1.
ruthenocenophan-1,13-dione (4) in $52 \%$ yield (Scheme 1). The carbonyl frequency of $\mathbf{4}$ was observed at 1645 $\mathrm{cm}^{-1}$. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of 4 showed the cyclopentadienyl $(\mathrm{Cp})$ ring protons as a triplet $(1 \mathrm{H})$ at $\delta$ 4.72 and a doublet $(2 \mathrm{H})$ at $\delta 5.02$, indicating a symmetrical 1,2-di-substitution of the Cp ring of the ruthenocene moiety. In coincidence with this, only six carbon signals were observed in the ${ }^{13} \mathrm{C}$-NMR spectrum of 4. The molecular structure was determined by X-ray diffraction. Half of the molecule of $\mathbf{4}$ is crystallographically unique, with the whole molecule located on an inversion center. The ortep view of 4 is shown in Fig. 1. The crystallographic data are summarized in Table 1 and the selected bond distances and angles are shown in Table 2. The unique feature of $\mathbf{4}$ is the anti-coordination of two $\left(\eta-\mathrm{C}_{5} \mathrm{Me}_{5}\right) \mathrm{Ru}$ moieties toward the central indacen-4-dione ligand coordinated by a $\eta^{5}$-coordination mode. This is probably because the $\mathrm{Cp} *$ ligand is sterically bulky.

The $\eta-\mathrm{C}_{5} \mathrm{H}_{3}$ and $\eta-\mathrm{C}_{5} \mathrm{Me}_{5}$ ligands in the pentamethylruthenocenyl parts took an eclipsed conformation and the $\mathrm{Ru}-\mathrm{C}$ (av. 2.174) and $\mathrm{C}-\mathrm{C}$ distances (av. $1.424 \AA$ ) are typical for ruthenocene derivatives. The central indacen-4-dione ligand is planar and no strain is observed in the bond distances and angles of the frame. As an additional feature, the carbonyl groups in $\mathbf{4}$ are protected by each one of the methyl groups of the two $\eta-\mathrm{C}_{5} \mathrm{Me}_{5}$ ligands in the pentamethylruthenocenyl moiety, because the methyl groups are arranged above and below the plane of carbonyl groups. As a supporting chemical evidence, the reduction of 4 with $\mathrm{LiAlH}_{4}$ or $\mathrm{LiAlH}_{4}-\mathrm{AlCl}_{3}$ was tried in various conditions, but 4 never reduced with $\mathrm{LiAlH}_{4}$ or $\mathrm{LiAlH}_{4}-\mathrm{AlCl}_{3}$.

Ruthenocene was lithiated with one equivalent of $t$-BuLi in THF at $0{ }^{\circ} \mathrm{C}$ and subsequently reacted with ethyl chloroformate to give 1-carbethoxyruthenocene
(5) and 1,1'-bis(carbethoxy)ruthenocene in 44 and $7.8 \%$ yields, respectively. The carboxylic acid (6) obtained from the hydrolysis of $\mathbf{5}$ was treated with $\left(\mathrm{CF}_{3} \mathrm{CO}\right)_{2} \mathrm{O}$ overnight at $120{ }^{\circ} \mathrm{C}$ to give anti- $[1.1](2,18)(6,14)$ ruth-enocenophan-1,13-dione ( 8 ) in a tiny yield. The chlorocarbonyl derivative (7), which was prepared from 6 and oxalyl chloride in the presence of pyridine, was treated with anhydrous aluminum chloride in refluxing dichloroethane to give diketone $\mathbf{8}$ in $3 \%$ yield, along with $[1,1](2,20)(6,14)$ ruthenocenophane-1,13-dione (9) ( $3 \%$ ) (Scheme 1). The carbonyl frequency of $\mathbf{8}$ (1644 $\mathrm{cm}^{-1}$ ) was observed in the range similar to that of 4 . However, the proton signals ( $\delta 5.01$ and 5.48) of the substituted $\eta-\mathrm{C}_{5} \mathrm{H}_{3}$ ring and the carbon signal (190.34 ppm ) of the carbonyl group of $\mathbf{8}$ were shifted downfield compared with those of 4 . This is probably, because of

the presence of the electron-releasing $\eta-\mathrm{C}_{5} \mathrm{Me}_{5}$ ligand in 4.

In the ${ }^{1} \mathrm{H}$-NMR spectrum of $\mathbf{9}$, the signal of the $\beta$-ring protons of the ruthenocene moiety is somewhat broadened at room temperature, indicating the presence of a dynamic process. The VT-NMR spectrum of $\mathbf{9}$ in $\mathrm{CDCl}_{3}$ afforded the $\alpha$ - and $\beta$-proton signals as sharp triplets at $\delta 5.47$ and 4.76 at $60^{\circ} \mathrm{C}$. On the other hand, the $\alpha$-proton signals were observed at $\delta 5.58$ and 5.46 and $\beta$-proton signals appeared at $\delta 4.90$ and 4.72 as broad multiplets at $-55^{\circ} \mathrm{C}$ (Fig. 2). No signal corresponding to an anti-isomer was observed, differently
from the case of $[1,1](2,20)(6,14)$ ferrocenophane-1,13dione. The activation free energy for the dynamic process of the fractional molecule 9 was calculated to be $\Delta G^{\neq}=56.5 \mathrm{~kJ} \mathrm{~mol}{ }^{-1}$ at 270 K from the coalescence temperature ( 270 K ). The energy is smaller than that of $[1,1](2,20)(6,14)$ ferrocenophane-1,13-dione $\left(\Delta G^{\neq}=58.7\right.$ $\mathrm{kJ} \mathrm{mol}^{-1}$ ) [8]. In coincidence with this, the value of $\Delta G^{\neq}=57.2 \mathrm{~kJ} \mathrm{~mol}^{-1}$ was reported for the dynamic process of $[1,1](2,20)(6,14)$ ferrocenoruthenocenophane1,13 -dione [9]. It was reported [10] that [1,1]ferrocenophane adopted a $\operatorname{syn}$-conformation, having a large flexibility toward a molecular twisting contrary to the anti-conformation. Then, the dynamic process observed above seems to be due to a molecular twisting similar to that proposed for syn-[1,1]ferrocenophane (Scheme 2 ). The smaller $\Delta G^{\neq}$value for $[1,1](2,20)(6,14)$ ruth-enocenophane-1,13-dione compared with those for $[1,1](2,20)(6,14)$ ferrocenophane-1,13-dione and [1,1]$(2,20)(6,14)$ ferrocenoruthenocenophane-1,13-dione seems to reflect the increase of the molecular flexibility, which is caused by the larger interring distance for ruthenocene ( $3.68 \AA$ ) compared with that for ferrocene (3.32 Å).

### 2.2. Electrochemistry

Diketones $\mathbf{4}$ and $\mathbf{8}$ are formally considered to be a quinone fused two ruthenocenes. Therefore, the reduction potentials of compounds 4 and 8 , as well as benzoquinone and anthraquinone, were measured by

Fig. 2. VT-NMR spectrum of $\mathbf{9}$.

Scheme 2.
cyclic voltammetry (CV) and the reduction potentials were summarized in Table 3. Benzoquinone showed two quasi-reversible redox waves at half wave potential $\left(E_{1 / 2}\right)=-0.96$ and -1.50 V , while anthraquinone showed one broad reduction wave and one broad oxidation wave due to the carbonyl group at $E_{\mathrm{pc}}=-1.55$ V , and $E_{\mathrm{pa}}=-1.31 \mathrm{~V}$, respectively. On the other hand, diketones $\mathbf{4}$ and $\mathbf{8}$ exhibited only one broad reduction wave at $E_{\mathrm{pc}}=-1.42$ and -1.46 V , respectively, (the cyclic voltammograms were broad due to a little solubility of the samples). The fusion of two benzene rings to benzoquinone makes difficult to reduce largely $\left(\Delta E_{\mathrm{pc}}=0.50 \mathrm{~V}\right)$, because of the lack of the quinoid character. It is well known that, ruthenocene has an electron-releasing ability similar to ferrocene. So, the fusion of ruthenocene to benzoquinone is expected to increase the difficulty of diketones for reduction compared with the fusion of benzene. However, the reduction potential of $4\left(\Delta E_{\mathrm{pc}}=0.37 \mathrm{~V}\right)$ and $8\left(\Delta E_{\mathrm{pc}}=0.41\right.$ V ) is lower than that of anthraquinone. This may be probably, because, the radical anion forming in reduction of $\mathbf{4}$ and $\mathbf{8}$ is stabilized by the delocalization to the Ru metal center as shown in Scheme 3.

### 2.3. Protonation and methylation

It is well known that a ferrocenyl group strongly stabilizes a $\alpha$-carbonium cation and a ruthenocenyl group also has a similar ability [11]. So, the carbonyl group of acetylferrocene is much more easily protonated than the metal atom to give the ferrocenyl-stabilized carbocation [12]. Diketones $\mathbf{4}$ and $\mathbf{8}$ were dissolved in strong acid to give a violet and brown solution, respectively. In the UV-vis spectrum of $\mathbf{4}$ and $\mathbf{8}$ in $60 \%$ $\mathrm{H}_{2} \mathrm{SO}_{4}$, considerably strong absorptions were observed at 554 and 534 nm , respectively. These absorption bands may be probably the MLCT band, which is caused by the delocalization of the positive charge to the metal site due to the canonical structures $\mathbf{A}-\mathbf{C}$ as shown in Scheme 4. The bathochromic shift in $\mathbf{4}$ may be caused by the larger delocalization of the positive charge due to the electron-releasing methyl group compared with 8. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of 4 in $\mathrm{CF}_{3}$ COOD showed the down-field shift of the $\eta-\mathrm{C}_{5} \mathrm{H}_{3}$
ring protons ( $\Delta \delta 0.77 \mathrm{ppm}$ ) and the methyl protons ( $\Delta \delta$ 0.09 ppm ). A similar, but somewhat smaller down-field shift ( $\Delta \delta 0.56$ and 0.62 ppm for the $\eta-\mathrm{C}_{5} \mathrm{H}_{3}$ ring and $\Delta \delta$ 0.31 ppm for the $\eta-\mathrm{C}_{5} \mathrm{H}_{5}$ ring) was also observed in $\mathbf{8}$. These indicate that the positive charge in the protonated cations of $\mathbf{4}$ and $\mathbf{8}$ is delocalized to the ruthenocenyl moiety as shown in Scheme 4. However, it is considered that the delocalization is partial and the contribution of the canonical structure $\mathbf{C}$ is small, because, it was reported that the proton signal of the $\eta-\mathrm{C}_{5} \mathrm{H}_{5}$ ring of $\left[\left(\eta-\mathrm{C}_{5} \mathrm{H}_{5}\right) \mathrm{Ru}\left(\eta^{6}-\mathrm{C}_{5} \mathrm{Me}_{4} \mathrm{CH}_{2}\right)\right]^{+}$was shifted to down-field by 1.0 ppm compared with that of the neutral species [13]. A similar down-field shift ( $\Delta$ 0.98 ppm ) was also observed when ruthenocenylmethanol was dissolved in $\mathrm{CF}_{3} \mathrm{COOD}$. When bis(ruthenocenyl)ketone [14] was dissolved in $\mathrm{CF}_{3} \mathrm{COOD}$, the ${ }^{1} \mathrm{H}$-NMR spectrum of the protonated species showed the proton signal for the $\eta-\mathrm{C}_{5} \mathrm{H}_{5}$ ring at $\delta 4.87$, the $\alpha$ - and $\beta$-proton signals for the $\eta-\mathrm{C}_{5} \mathrm{H}_{4}$ ring at $\delta$ 5.60 and 5.43 , respectively. The down-field shift of the former from the corresponding proton signal of the neutral ketone is $\Delta=0.29 \mathrm{ppm}$ and those of the latter are $\Delta=0.34$ and 0.70 ppm , respectively. The value of the down-field shift is nearly similar to those observed in 8 . Therefore, it is considered that the positive charge in the protonated ketones is not delocalized sufficiently to the central metal in the ruthenocene moiety compared with that in the $\left[\left(\eta-\mathrm{C}_{5} \mathrm{H}_{5}\right) \mathrm{Ru}\left(\eta^{6}-\mathrm{C}_{5} \mathrm{Me}_{4} \mathrm{CH}_{2}\right)\right]^{+}$ complex.
The violet solution of 4 in a small amount of $\mathrm{CF}_{3} \mathrm{COOH}$ was diffused with pentane to give red crystals (10) in high yield. The crystals were moisture-sensitive and turned back to the starting yellow $\mathbf{4}$ on keeping in the air, gradually even in crystal state. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$

[^1]
Scheme 3.

Scheme 4.
spectrum of $\mathbf{1 0}$ in $\mathrm{CDCl}_{3}$ showed the signals of the ruthenocenyl moiety as a triplet at $\delta 5.48$ and a doublet at $\delta 5.78$ and the methyl signal as a singlet at $\delta 1.75$. The spectrum is very similar to that of $\mathbf{4}$ in $\mathrm{CF}_{3} \mathrm{COOD}$. The ring protons of ruthenoceny moiety of $\mathbf{1 0}$ shifted down-field by ca. 0.75 ppm compared with that of 4 . This supports the structure doubly protonated to 4 . The single-crystal X-ray diffraction of $\mathbf{1 0}$ was possible only by using the crystals coated with epoxy resin, because the crystals turned back to $\mathbf{4}$ on the exposure to the air if they are not coated. Half of the molecules of $\mathbf{1 0}$ are crystallographically unique, with the whole molecule located on an inversion center. The crystallographic data are summarized in Table 1 and the ORTEP view of $\mathbf{1 0}$ is shown in Fig. 3. The selected bond distances and angles are summarized in Table 4. The central indacene framework is planar and nearly remains unchanged after protonation. The $\mathrm{C}(3)-\mathrm{O}(2)$ distance [1.266(5) Å] is elongated compared with the corresponding $\mathrm{C}-\mathrm{O}$ distance $[1.232(6) \AA]$ of $\mathbf{4}$, while the $\mathrm{C}(3)-\mathrm{C}(8)$ distance $[1.441(5) \AA]$ is shortened than that $[1.460(7) \AA]$ of 4 , although, the $\mathrm{C}(3)-\mathrm{C}(4)$ distance is $1.480(5)$, meaning the weak protonation on the oxygen atom of the neutral compound 4. On addition, the presence of the intramolecular hydrogen bond may be suggested, the distances between the $\mathrm{O}(2)$ atom of the central ligand and the $\mathrm{O}(3)$ and $\mathrm{O}(4)$ atoms of $\mathrm{CF}_{3} \mathrm{COO}^{-}$anion in $\mathbf{1 0}$
are $2.549(10)$ and $3.17(3) \AA$, respectively. The distances are somewhat longer than those of the intramolecular hydrogen bond observed in maleic acid [2.75 and 2.44 $\AA$ A] [15]. These data seem to suggest that in $\mathbf{1 0}$ the proton weakly attaches to the oxygen atom and the carbonyl group remains its original character ( $\mathbf{D}$ or $\mathbf{E}$ in Scheme 5), that is, the carbonyl group is not completely converted to the hydroxyl group (F). This may be supported from the fact that the $\mathrm{C}(20)-\mathrm{O}(3)[1.10$ (3) $\AA]$ and $\mathrm{C}(20)-\mathrm{O}(4)$ distances $[1.27(3) \AA]$ are not equal, although, the detailed discussion is not possible, because of $R=0.80$ and the large disorder.

The reaction of 4 with $\mathrm{CF}_{3} \mathrm{SO}_{3} \mathrm{CH}_{3}$ gave the methylated compound 11, anti-8,9,10,11,12,20,21,22,23,24-decamethyl-1,13-dimethoxy[1.1](2,15)(6,14)ruthenocenophane bis(trifluorosulfonate), in moderate yield (Scheme 4). In the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of 11, the ring protons of the indacene ligand appeared one triplet $(2 \mathrm{H})$ at $\delta 5.16$ and one doublet $(1 \mathrm{H})$ at $\delta 5.53$ and the singlet $(6 \mathrm{H})$ due to the methoxyl group was observed at $\delta 4.22$, supporting the dicationic structure of $\mathbf{1 1}$. However, the down-field shift ( $\Delta \delta 0.44$ and 0.51 ) of the former signals, compared with the corresponding protons of the neutral $\mathbf{4}$, is considerably smaller than those of the protonated species $\mathbf{1 0}(\Delta \delta 0.76$ and 0.76$)$. This seems to be attributed to the electron-releasing effect of the methyl group. In compound 4, each one of the

Fig. 3. ORTEP view of complex 10.
methyl groups of the two $\eta-\mathrm{C}_{5} \mathrm{Me}_{5}$ ligands in the pentamethylruthenocenyl moiety are arranged above and below the plane of the carbonyl groups, so that 4 never reacted with $\mathrm{LiAlH}_{4}$ or $\mathrm{LiAlH}_{4}-\mathrm{AlCl}_{3}$ in which hydride anion attacked the carbonyl group from the top and bottom of the plane. On the other hand, protonation and methylation were possible, because proton and methyl cation attacked the carbonyl group within the plane in these reactions without the steric hindrance by the methyl group.

## 3. Experimental

All reactions were carried out under an atmosphere of $\mathrm{N}_{2}$ and/or Ar and workups were performed without precaution to exclude air. NMR spectra were recorded on Bruker AM400 or ARX400 spectrometer. IR ( KBr disc) spectra were recorded on Perkin-Elmer System 2000 spectrometer. CV was carried out by using ALS 600 in $10^{-1} \mathrm{M}$ solution of $n-\mathrm{Bu}_{4} \mathrm{NClO}_{4}$ (polarography grade, Nacalai tesque) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. CV's cells were fitted with glassy carbon (GC) working electrode, Pt wire counter electrode and $\mathrm{Ag} / \mathrm{Ag}^{+}$pseudo reference electrode. The cyclic voltammograms were obtained at the scan rate of $0.1 \mathrm{~V} \mathrm{~s}^{-1}$ in the $10^{-3} \mathrm{M}$ or saturated solution of complexes. All potentials were represented versus $\mathrm{FcH} / \mathrm{FcH}^{+}$, which were obtained by the subsequent measurement of ferrocene at the same conditions. Solvents were purified by distillation from the drying agent prior to use as follows: $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(\mathrm{CaCl}_{2}\right)$; $\mathrm{ClCH}_{2} \mathrm{CH}_{2} \mathrm{Cl} \quad\left(\mathrm{CaCl}_{2}\right) ; \quad \mathrm{CH}_{3} \mathrm{CN} \quad\left(\mathrm{CaH}_{2}\right) ;$ acetone
$\left(\mathrm{CaSO}_{4}\right)$; THF (Na-benzophenone); ether $\left(\mathrm{LiAlH}_{4}\right)$. Ruthenocene [16] and 1,2,3,4,5-pentamethylruthenocene (1) [17] were prepared according to the literatures. Other reagents were used as received from commercial suppliers.

### 3.1. 1-Methoxycarbonyl-1', $2^{\prime}, 3^{\prime}, 4^{\prime}, 5^{\prime}$-pentamethylruthenocene (2)

A mixture of activated manganese oxide (Aldrich) ( $3.1 \mathrm{~g}, 36 \mathrm{mmol}$ ), potassium cyanide ( $0.45 \mathrm{~g}, 7 \mathrm{mmol}$ ), $\mathrm{MeOH}(45 \mathrm{ml})$, and $\mathrm{AcOH}(0.15 \mathrm{ml})$ was stirred for a little while under Ar. To the solution was added a solution of 1 -formyl- $1^{\prime}, 2^{\prime}, 3^{\prime}, 4^{\prime}, 5^{\prime}$ pentamethylruthenocene (1) $(0.90 \mathrm{~g}, 2.7 \mathrm{mmol})$ in $\mathrm{MeOH}(4.5 \mathrm{ml})$ and then the mixture was stirred for 4 days at room temperature (r.t.). After filtration, the residue was washed with benzene. The filtrate and the washing were combined and evaporated under reduced pressure. The residue was chromatographed on alumina with elution

of benzene to give the title compound $(0.80 \mathrm{~g}, 83 \%$ as yellow crystals. Melting point (m.p.) $72-73{ }^{\circ} \mathrm{C}$. Anal. Found: C, 57.06; H, 6.20. $\mathrm{C}_{17} \mathrm{H}_{22} \mathrm{O}_{2} \mathrm{Ru}$. Calc. C, 56.81; H, 6.17\%. IR (KBr): $1715 \mathrm{~cm}^{-1}$ (CO). ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 1.85(\mathrm{~s}, 15 \mathrm{H}), 3.74(\mathrm{~s}, 3 \mathrm{H}), 4.37(\mathrm{t}$, $J=1.8 \mathrm{~Hz}, 2 \mathrm{H})$, and $4.70(\mathrm{t}, J=1.8 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}-$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 11.32$ (Me), $51.09(\mathrm{OMe})$, $73.46\left(\eta-\mathrm{C}_{5} \mathrm{H}_{5}\right), 75.43\left(\eta-\mathrm{C}_{5} \mathrm{H}_{4}\right), 75.44\left(\eta-\mathrm{C}_{5} \mathrm{H}_{4}\right), 76.16$ (ipso $-\mathrm{C}_{5} \mathrm{H}_{4}$ ), 86.21 (ipso- $\mathrm{C}_{5} \mathrm{Me}_{5}$ ) and $169.70(\mathrm{CO})$.

### 3.2. 1-Carboxy-1', $2^{\prime}, 3^{\prime}, 4^{\prime}, 5^{\prime}$-pentamethylruthenocene

A mixture of $2(1.10 \mathrm{~g}, 3 \mathrm{mmol}), 2 \mathrm{M}$ aq. NaOH solution ( 15 ml ), and $\mathrm{EtOH}(25 \mathrm{ml})$ was refluxed under an atmosphere of nitrogen. After cooling, the mixture was poured into 1 N aq. HCl solution ( 100 ml ). The resulting precipitate was filtered and dried to give the title compound ( 1.05 g , quantitative yield) as colorless solid, which was recrystallized from ethanol to give pale yellow crystals. M.p. $218{ }^{\circ} \mathrm{C}$. Anal. Found: C, 55.62; $\mathrm{H}, 5.80 . \mathrm{C}_{16} \mathrm{H}_{20} \mathrm{O}_{2} \mathrm{Ru}$. Calc. C, $55.64 ; \mathrm{H}, 5.84 \%$. IR (KBr): 3200-2200 (broad) and $1682 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}-\mathrm{NMR}$ ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 1.86(\mathrm{~s}, 15 \mathrm{H}), 4.43(\mathrm{t}, J=1.8 \mathrm{~Hz}$, $2 \mathrm{H}), 4.73(\mathrm{t}, J=1.8 \mathrm{~Hz}, 2 \mathrm{H})$, and $12.06($ broad s, 1 H$)$. ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 10.08(\mathrm{Me}), 73.84$ $\left(\eta-\mathrm{C}_{5} \mathrm{H}_{5}\right), 75.90 \quad\left(\eta-\mathrm{C}_{5} \mathrm{H}_{4}\right), 75.09 \quad\left(\right.$ ipso $\left.-\mathrm{C}_{5} \mathrm{H}_{4}\right), 86.27$ (ipso $-\mathrm{C}_{5} \mathrm{Me}_{5}$ ) and 175.51 (CO).

## 3.3. anti-8,9,10,11,12,-20,21,22,23,24-decaMethyl-[1.1](2,18)(6,14)ruthenocenophan-1,13-dione (4)

A solution of $\mathbf{3}(100 \mathrm{mg}, 0.30 \mathrm{mmol})$ in trifluoroacetic anhydride ( 2.0 ml ) was heated at $85-90{ }^{\circ} \mathrm{C}$ in a sealed tube for 18 h . After cooling, the black content was washed out with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and the washing was poured into saturated aq. $\mathrm{Na}_{2} \mathrm{CO}_{3}$ solution. The mixture was stirred for a while. The organic layer was separated, washed with water, and dried over $\mathrm{MgSO}_{4}$. After evaporation, the residue was chromatographed on alumina by elution of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to give the title compound ( 51 $\mathrm{mg}, 52 \%$ ) as yellow crystals (m.p. $>250^{\circ} \mathrm{C}$ ). Anal. Found: C, 58.62; H, 5.49. $\mathrm{C}_{32} \mathrm{H}_{36} \mathrm{O}_{2} \mathrm{Ru}_{2}$. Calc. C, 58.70; $\mathrm{H}, 5.54 \%$. IR ( KBr ): $1645 \mathrm{~cm}^{-1}$. UV-vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ : 403.5 ( $\varepsilon 9000$ ), 315.5 ( 12000 ), and $270.5 \mathrm{~nm}(32000)$. UV-vis ( $60 \% \mathrm{H}_{2} \mathrm{SO}_{4}$ ): 554 ( $\varepsilon 8700$ ), 444 ( 10800 ), 389.5
(19000), and $282 \mathrm{~nm}(20000) .{ }^{1} \mathrm{H}-\mathrm{NMR}$ ( 400 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta 1.66\left(\mathrm{~s}, 30 \mathrm{H}, \eta-\mathrm{C}_{5} \mathrm{H}_{5}\right), 4.72(\mathrm{t}, J=2.5 \mathrm{~Hz}$, $2 \mathrm{H}, \eta-\mathrm{C}_{5} \mathrm{H}_{3}-\beta$ ), and $5.02\left(\mathrm{~d}, J=2.5 \mathrm{~Hz}, 4 \mathrm{H}, \eta-\mathrm{C}_{5} \mathrm{H}_{3}-\alpha\right)$. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CF}_{3} \mathrm{CO}_{2} \mathrm{D}\right): \delta 1.75(\mathrm{~s}, 30 \mathrm{H}, \eta-$ $\mathrm{C}_{5} \mathrm{H}_{5}$ ), 5.49 (bs, $2 \mathrm{H}, \eta-\mathrm{C}_{5} \mathrm{H}_{3}-\beta$ ), and 5.79 (bs, 4 H , $\eta$-C5H3- $\alpha$ ). ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 10.23$ (Me), $73.42\left(\eta-\mathrm{C}_{5} \mathrm{H}_{3}\right), 78.89\left(\eta-\mathrm{C}_{5} \mathrm{H}_{3}\right), 83.93$ (ipso$\mathrm{C}_{5} \mathrm{H}_{3}$ ), 88.02 (ipso- $\mathrm{C}_{5} \mathrm{Me}_{5}$ ) and 187.43 (CO). ${ }^{13} \mathrm{C}-\mathrm{NMR}$ ( $100 \mathrm{MHz}, \mathrm{CF}_{3} \mathrm{CO}_{2} \mathrm{D}$ ): $\delta 10.54(\mathrm{Me}), 79.16\left(\eta-\mathrm{C}_{5} \mathrm{H}_{3}\right)$, $84.70\left(\eta-\mathrm{C}_{5} \mathrm{H}_{3}\right), 89.02\left(\eta-\mathrm{C}_{5} \mathrm{H}_{3}\right), 96.54$ (ipso- $\mathrm{C}_{5} \mathrm{Me}_{5}$ ) and $185.78(\mathrm{CO})$.

### 3.4. Ethoxycarbonylruthenocene (5)

To a solution of ruthenocene $(1.28 \mathrm{~g}, 5.6 \mathrm{mmol})$ in anhydrous THF ( 30 ml ) was slowly added a solution of $t$-BuLi in pentane ( 4 ml of 1.5 M solution, 6 mmol ) at $0{ }^{\circ} \mathrm{C}$ under Ar. The solution was stirred for 50 min and then chilled below $-78{ }^{\circ} \mathrm{C}$. To the solution was added ethyl chloroformate ( $0.54 \mathrm{ml}, 5.6 \mathrm{mmol}$ ). The solution was warmed gradually to r.t. and then stirred overnight. After the solvent was evaporated under vacuum, the residue was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and water. The organic layer was separated and the aqueous (aq.) layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The organic layer and the extracts were combined and then dried over $\mathrm{MgSO}_{4}$. After the solvent was evaporated under vacuum, the residue was chromatographed on $\mathrm{Al}_{2} \mathrm{O}_{3}$ to give ruthenocene $(0.56 \mathrm{~g}, 44 \%)$, Ethoxycarbonylruthenocene (5) (0.75 g, 44\%), and 1,1'-bis(ethoxycarbonyl)ruthenocene ( $0.16 \mathrm{~g}, 8 \%$ ).

5: M.p. $80-81{ }^{\circ} \mathrm{C}$. Anal. Found: C, 51.75; H, 4.59. $\mathrm{C}_{13} \mathrm{H}_{14} \mathrm{O}_{2} \mathrm{Ru}$. Calc.: C, 51.48; H, 4.65\%. IR (KBr): 1683 $\mathrm{cm}^{-1}\left(v_{\mathrm{CO}}\right) .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 1.28(\mathrm{t}$, $\left.J=7.4 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 4.18\left(\mathrm{q}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right)$, $4.58\left(\mathrm{~s}, 5 \mathrm{H}, \eta-\mathrm{C}_{5} \mathrm{H}_{5}\right), 4.69\left(\mathrm{t}, J=1.5 \mathrm{~Hz}, 2 \mathrm{H}, \eta-\mathrm{C}_{5} \mathrm{HO}\right)$, and $5.13\left(\mathrm{t}, J=1.5 \mathrm{~Hz}, 2 \mathrm{H}, \eta-\mathrm{C}_{5} \mathrm{H}_{4}-\alpha\right) .{ }^{13} \mathrm{C}-\mathrm{NMR}(100$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 14.34\left(\mathrm{CH}_{3}\right), 60.04\left(\mathrm{CH}_{2}\right), 71.61(\eta-$ $\left.\mathrm{C}_{5} \mathrm{H}_{4}-\beta\right), 71.72\left(\eta-\mathrm{C}_{5} \mathrm{H}_{5}\right), 72.71\left(\eta-\mathrm{C}_{5} \mathrm{H}_{4}-\alpha\right), 75.89(\eta-$ $\mathrm{C}_{5} \mathrm{H}_{4}$-ipso), and 170.25 (CO).
1.1'-Bis(ethoxycarbonyl)ruthenocene: m.p. 89$90{ }^{\circ} \mathrm{C}$. Anal. Found: C, 51.38; H, 4.72. $\mathrm{C}_{16} \mathrm{H}_{18} \mathrm{O}_{4} \mathrm{Ru}$. Calc.: C, 51.19 ; H, $4.83 \%$. IR (KBr): $1683 \mathrm{~cm}^{-1}\left(v_{\mathrm{CO}}\right)$. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 1.30(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}$, $\left.\mathrm{CH}_{3}\right), 4.21\left(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 4.58(\mathrm{~s}, 5 \mathrm{H}$,
$\left.\eta-\mathrm{C}_{5} \mathrm{H}_{5}\right), 4.72\left(\mathrm{t}, J=1.7 \mathrm{~Hz}, 2 \mathrm{H}, \eta-\mathrm{C}_{5} \mathrm{H}_{4}-\beta\right)$, and 5.16 ( $\mathrm{t}, J=1.7 \mathrm{~Hz}, 2 \mathrm{H}, \eta-\mathrm{C}_{5} \mathrm{H}_{4}-\alpha$ ). ${ }^{13} \mathrm{C}-\mathrm{NMR}(100 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta 14.32\left(\mathrm{CH}_{3}\right), 60.31\left(\mathrm{CH}_{2}\right), 73.20\left(\eta-\mathrm{C}_{5} \mathrm{H}_{4}-\beta\right)$, $74.20\left(\eta-\mathrm{C}_{5} \mathrm{H}_{4}-\alpha\right), 77.49 \quad\left(\eta-\mathrm{C}_{5} \mathrm{H}_{4}\right.$-ipso $)$, and 169.07 (CO).

## 3.5. anti-[1.1](2,18)(6,74)Ruthenocenophan-1,13-dione <br> (8) and $[1,1](2,20)(8,14)$ ruthenocenophane-1,13-dione (9)

To a solution of chlorocarbonylruthenocene (7) (62 $\mathrm{mg}, 0.20 \mathrm{mmol}$ ) in dichloroethane ( 10 ml ) was added aluminum chloride ( $52 \mathrm{mg}, 0.39 \mathrm{mmol}$ ). The mixture was refluxed for 12 h under N . After being hydrolyzed with water, the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. A large amount of the decomposed products were seen. The extract was dried over $\mathrm{MgSO}_{4}$ and evaporated in vacuum. The residue was chromatographed on $\mathrm{SiO}_{2}$ with benzene-EtOAc to give diketones $\mathbf{8}(1.5 \mathrm{mg}, 3 \%)$ and $9(1.5 \mathrm{mg}, 3 \%)$, along with a complex mixture. No starting material could be found.

Compound 8: m.p. $>250^{\circ} \mathrm{C}$. Anal. Found: C, 51.69; H, 2.99. $\mathrm{C}_{22} \mathrm{H}_{16} \mathrm{O}_{2} \mathrm{Ru}_{2}$. Calc.: C, 51.36; H, 3.13\%. UV-vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): 386(\varepsilon 6000)$, and $255.5 \mathrm{~nm}(38000)$. UV-vis ( $60 \% \mathrm{H}_{2} \mathrm{SO}_{4}$ ): 533.5 ( $\varepsilon 900$ ), 378 (6800), and $280 \mathrm{~nm}(11200)$. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$ ): $\delta 4.62$ (s, $10 \mathrm{H}, \eta-\mathrm{C}_{5} \mathrm{H}_{5}$ ), $5.01\left(\mathrm{t}, J=2.6 \mathrm{~Hz}, \eta-\mathrm{C}_{5} \mathrm{H}_{3}-\beta\right.$ ), and $5.48\left(\mathrm{~d}, J=2.6 \mathrm{~Hz}, \eta-\mathrm{C}_{5} \mathrm{H}_{3}-\alpha\right) .{ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz}$, $\mathrm{CF}_{3} \mathrm{CO}_{2} \mathrm{D}$ ): $\delta 4.93\left(\mathrm{~s}, 10 \mathrm{H}, \eta-\mathrm{C}_{5} \mathrm{H}_{5}\right.$ ), 5.63 (bs, 2 H , $\eta-\mathrm{C}_{5} \mathrm{H}_{3}-\beta$ ), and 6.04 (bs, $4 \mathrm{H}, \eta-\mathrm{C}_{5} \mathrm{H}_{3}-\alpha$ ). ${ }^{13} \mathrm{C}$-NMR ( 100 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 71.69\left(\eta-\mathrm{C}_{5} \mathrm{H}_{4}-\beta\right)$, $74.60\left(\eta-\mathrm{C}_{5} \mathrm{H}_{4}-\alpha\right)$, $82.83\left(\eta-\mathrm{C}_{5} \mathrm{H}_{4}\right.$-ipso), and $190.34(\mathrm{CO})$.

Compound 9: m.p. $>250^{\circ} \mathrm{C}$. Anal. Found: C, 51.01; H, 3.00. $\mathrm{C}_{22} \mathrm{H}_{16} \mathrm{O}_{2} \mathrm{Ru}_{2}$. Calc.: C, 51.36 ; H, $3.13 \%$. IR ( KBr ): $1627 \mathrm{~cm}^{-1}(\mathrm{CO})$. UV-vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): 378(\varepsilon$ 1400), and 265 mm ( 11200 ). ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ( 400 MHz , $\mathrm{CDCl}_{3}$, r.t.): $\delta 4.77$ (bs, $\eta-\mathrm{C}_{5} \mathrm{H}_{3}-\beta$ ), and 5.48 (bs, $\eta-$ $\mathrm{C}_{5} \mathrm{H}_{3}-\alpha$ ). ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}, 333 \mathrm{~K}\right.$ ): $\delta 4.76$ ( $\mathrm{t}, J=2.6 \mathrm{~Hz}, \eta-\mathrm{C}_{5} \mathrm{H}_{3}-\beta$ ), and $5.47(\mathrm{t}, J=2.6 \mathrm{~Hz}$, $\eta-\mathrm{C}_{5} \mathrm{H}_{3}-\alpha$ ). ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}, 223 \mathrm{~K}\right): \delta 4.72$ (bt, $\eta-\mathrm{C}_{5} \mathrm{H}_{3}-\alpha$ ), 4.90 (bt, $\eta-\mathrm{C}_{5} \mathrm{H}_{3}-\beta$ ) 5.46 (bs, $\eta-\mathrm{C}_{5} \mathrm{H}_{3}-\beta$ ), and 5.58 (bs, $\eta-\mathrm{C}_{5} \mathrm{H}_{3}-\alpha$ ). ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ : $\delta 71.69\left(\eta-\mathrm{C}_{5} \mathrm{H}_{4}-\alpha\right), 74.60\left(\eta-\mathrm{C}_{5} \mathrm{H}_{4}-\alpha\right), 82.83\left(\eta-\mathrm{C}_{5} \mathrm{H}_{4}{ }^{-}\right.$ ipso), and 190.34 (CO).

Compound $\mathbf{8}$ was also prepared in a trace yield by using the procedure described above about the preparation of 4.

### 3.6. Protonation of $\mathbf{4}$

A solution of 4 ( $10 \mathrm{mg}, 0.015 \mathrm{mmol}$ ) in trifluoroacetic acid (ca. 0.5 ml ) was stirred for 3 h under nitrogen. After the solution had been condensed under reduced pressure, the solution of the residue in a small amount of benzene was diffused with pentane in the refrigerator. The hygroscopic red crystals were isolated. ${ }^{1} \mathrm{H}$ -

NMR ( $\mathrm{CDCl}_{3}$ ): $\delta 1.75(\mathrm{~s}, 30 \mathrm{H}, \mathrm{Me}), 5.48(\mathrm{t}, J=2.9 \mathrm{~Hz}$, $2 \mathrm{H}, \beta-\mathrm{H})$, and $5.78(\mathrm{~d}, J=2.9 \mathrm{~Hz}, 4 \mathrm{H}, \alpha-\mathrm{H})$.

### 3.7. Methylation of $\mathbf{4}$

A solution of $4(52 \mathrm{mg}, 0.078 \mathrm{mmol})$ in methyl trifluorosulfonate ( ca .2 ml ) was stirred for 3 h under nitrogen. After evaporating under reduced pressure, the solution of the residue in a small amount of benzene was diffused with pentane in the refrigerator. The hygroscopic and dark red crystals were isolated. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ $\left(\mathrm{CDCl}_{3}\right): \delta 1.66(\mathrm{~s}, 30 \mathrm{H}, \mathrm{Me}), 4.22(\mathrm{~s}, 6 \mathrm{H}, \mathrm{Me})$, $5.16(\mathrm{t}$, $J=2.9 \mathrm{~Hz}, 2 \mathrm{H}, \beta-\mathrm{H})$, and $5.53(\mathrm{~d}, J=2.9 \mathrm{~Hz}, 4 \mathrm{H}$, $\alpha-H)$.

### 3.8. Structure determinations

The crystallographic data are listed in Table 1 for 4, and 10. Data collections for $\mathbf{1 0}$ were performed at r.t. on Mac Science MXC18K diffractometer with graphite monochromated $\mathrm{Mo}-\mathrm{K}_{\alpha}$ radiation and an $18-\mathrm{kW}$ rotating anode generator. The structure was solved with the Diadif-Patty or SIR method in CRySTAN-G (soft-ware-package for structure determination) and refined by full-matrix least-squares procedure. Absorption correction with the $\Psi$-scan method and anisotropical refinement for non-hydrogen atom was carried out. Data collections of crystal data for $\mathbf{4}$ were performed at r.t. by the Weissenberg method on Mac Science DIP3000 image processor with graphite monochromated $\mathrm{Mo}-\mathrm{K}_{\alpha}$ radiation and an $18-\mathrm{kW}$ rotating anode generator. The structure was solved with the SIR method in maxus (software-package for structure determination) and refined finally by full-matrix least-squares procedure. Absorption correction with the Sortav method and anisotropical refinement for non-hydrogen atom was carried out. All the hydrogen atoms, located from difference Fourier maps, were isotopically refined.

## 4. Supplementary material

Crystallographic data for the structural analysis have been deposited with the Cambridge Crystallographic Centre, CCDC no. 170610 for complex 4 and CCDC no. 170611 for complex 10. Copies of this information may be obtained free of charge from: The Director, CCDC, 12 Union Road, Cambridge DB2 1EZ, UK (Fax: + 441223-336-033; e-mail: deposit@ccdc.cam. ac.uk or www:http://www.ccdc.cam.ac.uk).

## Acknowledgements
