#### Abstract

$\left(\mathrm{R}_{2} \mathrm{Bi}\right)_{2} \mathrm{E}\left[\mathrm{E}=\mathrm{S}(\mathbf{1})\right.$, $\left.\mathrm{Te}(\mathbf{2}) ; \mathrm{R}=\mathrm{CH}\left(\mathrm{SiMe}_{3}\right)_{2}\right]$ are formed by reaction of $\mathrm{R}_{2} \mathrm{BiCl}$ with $\mathrm{Na}_{2} \mathrm{~S}$ or $\mathrm{Na}_{2} \mathrm{Te}$. The reaction of cyclo$(\mathrm{RSbSe})_{n}\left[n=2,3 ; \mathrm{R}=\mathrm{CH}\left(\mathrm{SiMe}_{3}\right)_{2}\right]$ with $\mathrm{W}(\mathrm{CO})_{5} \mathrm{THF}(\mathrm{THF}=$ tetrahydrofuran) in THF results in trapping of the dimer in cyclo$(\mathrm{RSbSe})_{2}\left[\mathrm{~W}(\mathrm{CO})_{5}\right]_{2}(\mathbf{3})$. The crystal structures of $\mathbf{1 , 2}$, and $\mathbf{3}$ are reported. (C) 2002 Elsevier Science B.V. All rights reserved.

Keywords: Bismuth; Antimony selenium; Tellurium; Tungsten complex; X-ray structure

## 1. Introduction

The first bis(diorganobismuth)chalcogenides, $\left(\mathrm{R}_{2} \mathrm{Bi}\right)_{2} \mathrm{E}(\mathrm{E}=\mathrm{O}, \mathrm{S}, \mathrm{Se}, \mathrm{Te})$ were prepared 15 years ago by chalcogen insertion into bismuth-bismuth bonds [1-4]; later also reactions between diorganobismuth halides and sodium chalcogenides were used [5]. The only examples with known crystal structures are the mesityl derivatives $\left(\mathrm{R}_{2} \mathrm{Bi}\right)_{2} \mathrm{E}[\mathrm{E}=\mathrm{O}, \mathrm{S}, \mathrm{Se} ; \mathrm{R}=2,4,6-$ $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}_{6} \mathrm{H}_{2}$ ] [5,6]. We report here on the synthesis and structural characterisation of two novel bis(dialkylbismuth)chalcogenides, $\left(\mathrm{R}_{2} \mathrm{Bi}\right)_{2} \mathrm{E}[\mathrm{E}=\mathrm{S}(\mathbf{1})$, $\mathrm{Te}(\mathbf{2}) ; \mathrm{R}=$ $\mathrm{CH}\left(\mathrm{SiMe}_{3}\right)_{2}$ ] protected by a bulky alkyl group. The telluride $\mathbf{2}$ is a heavy atom analogue of cacodyl oxide [7] and the first organometallic molecule with a $\mathrm{Bi}-\mathrm{Te}$ bond with a known crystal structure [8].

Known organoantimony selenides, cyclo-( RSbSe$)_{n}$ are trimers $\left(n=3 ; \quad \mathrm{R}=2,4,6-\left[\left(\mathrm{Me}_{3} \mathrm{Si}\right)_{2} \mathrm{CH}\right]_{3} \mathrm{C}_{6} \mathrm{H}_{2} \quad\right.$ [9], 2,6-[( $\left.\left.\mathrm{Me}_{3} \mathrm{Si}_{2}\right)_{2} \mathrm{CH}\right]_{2}-4-\left[\left(\mathrm{Me}_{3} \mathrm{Si}_{3} \mathrm{C}_{3} \mathrm{C}_{6} \mathrm{H}_{2}\right.\right.$ [10]) and a ring system in a dimer-trimer equilibrium $[n=2,3 ; \mathrm{R}=$ $\mathrm{CH}\left(\mathrm{SiMe}_{3}\right)_{2}$ ] [11]. We report here on the trapping of the dimer, cyclo $-(\mathrm{RSbSe})_{2}$ as ligand in the binuclear complex cyclo-(RSbSe) $)_{2}\left[\mathrm{~W}(\mathrm{CO})_{5}\right]_{2}$ (3). Complexes with cyclo $-(\mathrm{RSbSe})_{n}$ ligands have not been described before.

[^0]The analogous sulphur complex, cyclo-( RSbS$)_{2^{-}}$ $\left[\mathrm{W}(\mathrm{CO})_{5}\right]_{2}\left[\mathrm{R}=\mathrm{CH}\left(\mathrm{SiMe}_{3}\right)_{2}\right]$ was also synthesised and characterised by X-ray diffractometry [12]. Related compounds with known crystal structures are cyclo$\mathrm{R}_{2} \mathrm{Sb}_{2} \mathrm{Se} \quad\left(\mathrm{R}=2,6-\left[\left(\mathrm{Me}_{3} \mathrm{Si}\right)_{2} \mathrm{CH}\right]_{2}-4-\left[\left(\mathrm{Me}_{3} \mathrm{Si}\right)_{3} \mathrm{C}_{2} \mathrm{C}_{6} \mathrm{H}_{2}\right)\right.$ [10] and cyclo-(RAsSe $)_{2}\left[\mathrm{Mn}(\mathrm{CO})_{2}\left(\mathrm{CH}_{3} \mathrm{C}_{5} \mathrm{H}_{4}\right)\left(\mathrm{R}={ }^{t} \mathrm{Bu}\right.\right.$, $\mathrm{Bu}, \mathrm{Ph},{ }^{\mathrm{c}} \mathrm{C}_{6} \mathrm{H}_{11}$ ) [13].

## 2. Results and discussions

The bis(dialkylbismuth) sulfide and telluride 1 and 2 are formed by reaction of $\left[\left(\mathrm{Me}_{3} \mathrm{Si}\right)_{2} \mathrm{CH}\right]_{2} \mathrm{BiCl}$ with $\mathrm{Na}_{2} \mathrm{~S}$ in water or with $\mathrm{Na}_{2} \mathrm{Te}$ in liquid $\mathrm{NH}_{3}$, respectively.
$\underset{\mathrm{R}=\mathrm{CH}\left(\mathrm{SiMe}_{3}\right)_{2}}{2 \mathrm{R}_{2} \mathrm{BiCl}}+\underset{\mathrm{E}=\mathrm{S}}{\left.\mathrm{Na}_{2} \mathrm{E}\right), \mathrm{Te}(\mathbf{2})} \underset{\left(\mathrm{R}_{2} \mathrm{Bi}\right)_{2} \mathrm{E}}{\mathrm{E}}+\underset{\mathrm{NaCl}}{2 \mathrm{Na}}$
The sulfide $\mathbf{1}$ is a yellow crystalline compound, readily soluble in organic solvents. The solid compound decomposes in air; it is stable only at low temperature in an inert atmosphere. In solution decomposition occurs with formation of $\mathrm{R}_{3} \mathrm{Bi}\left[\mathrm{R}=\mathrm{CH}\left(\mathrm{SiMe}_{3}\right)_{2}\right]$ and $\mathrm{Bi}_{2} \mathrm{~S}_{3}$. A similar decomposition pathway was also reported for other bis(diorganobismuth) sulfides [3,5]. Complex 2 is a red-brown solid which is very unstable. Decomposition occurs in solution and in solid state even at low temperature $\left(-28^{\circ} \mathrm{C}\right)$. The NMR spectra of $\mathbf{1}$ and 2 in $\mathrm{C}_{6} \mathrm{D}_{6}$ at $20^{\circ} \mathrm{C}$ show two singlet signals for the trimethylsilyl groups and a singlet for the methine
protons. Characteristic mass spectra have been obtained by direct chemical ionisation or electron impact techniques.

To establish the solid-state structure of $\mathbf{1}$ and $\mathbf{2}, \mathrm{X}$-ray diffraction studies (see Table 1 for details) were carried out on single crystals obtained by cooling concentrated solutions of $\mathbf{1}$ in petroleum ether and of $\mathbf{2}$ in THF. The molecular structures are shown in Fig. 1. Selected bond lengths and angles are given in Table 2. The crystals of $\mathbf{1}$ and 2 consist of discrete molecules with a pyramidal environment around the bismuth centres. The $\mathrm{Bi}_{2} \mathrm{E}$ moieties are angular. The $\mathrm{Bi}-\mathrm{E}-\mathrm{Bi}$ angle in $\mathbf{1}$ [92.48(4) ${ }^{\circ}$ ] is larger than that found in $2\left[88.00(7)^{\circ}\right]$. As a general trend, the $\mathrm{Bi}-\mathrm{E}-\mathrm{Bi}$ angle becomes sharper going from the oxide to the telluride (see Table 3). The $\mathrm{Bi}-\mathrm{S}$ bond lengths in 1 [255.74(12) and 257.19(12) pm] are comparable with those found in $\left(\mathrm{Mes}_{2} \mathrm{Bi}\right)_{2} \mathrm{~S}[252.0(7)$ and $254.5(6) \mathrm{pm}$ ] [5]. The $\mathrm{Bi}-\mathrm{Te}$ bond lengths in 2 [287.2(3) and 288.9(2) pm] are considerably shorter than the shortest $\mathrm{Bi}-\mathrm{Te}$ distance found in the crystal of
$\mathrm{Bi}_{2} \mathrm{Te}_{3}$ [306.6(2) pm] [14]. An interesting aspect of the structures of $\mathbf{1}$ and $\mathbf{2}$ is the dissimilarity of the bond angles at bismuth: $\mathrm{C}-\mathrm{Bi}-\mathrm{C}=95.74(14)^{\circ} \quad$ and $104.63(15)^{\circ}$ in 1, $97.7(4)^{\circ}$ and $105.0(4)^{\circ}$ in 2; $\mathrm{C}-\mathrm{Bi}(1)-$ $\mathrm{E}(\mathrm{E}=\mathrm{S}) 93.56(10)^{\circ}$ and $103.19(10)^{\circ}$ in $1,(\mathrm{E}=\mathrm{Te})$ $93.5(3)$ and $103.9(3)^{\circ}$ in 2. This difference may be a consequence of the steric strain in the molecule, caused by the bulky $\mathrm{CH}\left(\mathrm{SiMe}_{3}\right)_{2}$ substituents. Similar distorsions have also been observed in the structures of $\left[\left(\mathrm{Me}_{3} \mathrm{Si}\right)_{2} \mathrm{CH}\right]_{3} \mathrm{Bi}$ [15] and $\left[\left(\mathrm{Me}_{3} \mathrm{Si}\right)_{2} \mathrm{CH}\right]_{2} \mathrm{BiCl}$ [16]. In order to describe the different conformations of bis(diorganobismuth)chalcogenides, the torsion angles $\varphi, \mathrm{Bi}-\mathrm{E}-\mathrm{Bi}-\mathrm{lp}$, where lp stands for the assumed direction of the lone pair at bismuth and $E$ for the chalcogen atom, are used. With an assignment of the terms syn and anti to angles of 0 and $180^{\circ}$, the extreme molecular conformations are syn-syn and syn-anti. As shown in Table 3 all the bis(diorganobismuth)chalcogenides with known crystal structures including 1 and 2 adopt intermediate conformations. They are closer to

Fig. 1. ORTEP-like representation of $\mathbf{1}$ and $\mathbf{2}$ at $50 \%$ probability showing the atomic numbering scheme.
syn-syn than to syn-anti (Table 3). In 1 and 2 the organic substituents exhibit a gauche orientation (Fig. 2) with respect to the $\mathrm{Bi} \cdots \mathrm{Bi}$ axis.

The ring-ring equilibrium mixture of cyclo-( RSbSe$)_{n}$ ( $\left.n=2, \quad 3 ; \quad \mathrm{R}=\mathrm{CH}\left(\mathrm{SiMe}_{3}\right)_{2} \quad[11]\right) \quad$ reacts with $\mathrm{W}(\mathrm{CO})_{s} \mathrm{THF}(\mathrm{THF}=$ tetrahydrofuran $)$ to form cyclo$(\mathrm{RSbSe})_{2}\left[\mathrm{~W}(\mathrm{CO})_{5}\right]_{2}(\mathbf{3})$.

Brown crystals of $\mathbf{3}$ were obtained in $42 \%$ yield by cooling petroleum ether solutions to $-28^{\circ} \mathrm{C}$. They are slightly soluble in aromatic or aliphatic hydrocarbons forming brown air sensitive solutions in THF, dichloromethane or chloroform which decompose slowly at room temperature also in an inert atmosphere. Crystals of $\mathbf{3}$ are however stable in the air for a short time; they are stable for months when stored under argon at $-30^{\circ} \mathrm{C}$.

Complex 3 was characterised by IR, NMR and by mass spectrometry using the DCI techniques. The NMR spectra of freshly prepared solutions of $\mathbf{3}$ in $\mathrm{C}_{6} \mathrm{D}_{6}$ are consistent with the structure established by X-ray diffraction (Fig. 3) and contain the expected two singlet signals for equivalent $\mathrm{Me}_{3} \mathrm{Si}(0.23 \mathrm{ppm})$ or $\mathrm{CH}(0.29$ ppm) groups. However, when solutions of $\mathbf{3}$ in $\mathrm{C}_{6} \mathrm{D}_{6}$ are exposed to sunlight two new singlet signals at 0.22 $\left(\mathrm{Me}_{3} \mathrm{Si}\right)$ and $0.28(\mathrm{CH}) \mathrm{ppm}$ appear. They reach a maximum of intensity after 90 min . The photochemical process is reversible and the original spectrum is recovered after 12 h in the absence of light. The most straightforward interpretation for these phenomena is to assume a photochemically induced equilibrium between 3 and the monomer $(\mathrm{CO})_{5} \mathrm{~W}(\mathrm{R}) \mathrm{Sb}=\mathrm{Se} \quad[\mathrm{R}=$ $\left.\mathrm{CH}\left(\mathrm{SiMe}_{3}\right)_{2}\right]$. However also the formation of the trans isomer of $\mathbf{3}$ cannot be excluded. Attempts to study the photolysed solutions by mass spectroscopy using the ESI technique failed.
The IR spectra of $\mathbf{3}$ show the common pattern for complexes of the type $\mathrm{LW}(\mathrm{CO})_{5}$. The structure of $\mathbf{3}$ as determined by single crystal X-ray diffractometry is shown in Fig. 4. The central unit consists of a fourmembered $\mathrm{Sb}_{2} \mathrm{Se}_{2}$ ring (mean deviation from planarity 12.41 pm ) with alternating antimony and selenium atoms. The dihedral angles between the $\mathrm{Sb}-\mathrm{Sb}-\mathrm{Se}$ planes is $15.6^{\circ}$ and between the $\mathrm{Se}-\mathrm{Se}-\mathrm{Sb}$ planes is $15.8^{\circ}$. In cyclo- $(\mathrm{RSbS})_{2}\left[\mathrm{~W}(\mathrm{CO})_{5}\right]_{2}$, which crystallises also as a cis isomer the mean deviation from the planarity is 9.65 pm [12]. In 3 both antimony atoms of

the ring are coordinated to $\mathrm{W}(\mathrm{CO})_{5}$ units which are in cis positions relative to the ring and trans to the alkyl groups. The $\mathrm{Sb}-\mathrm{Se}$ bond lengths [255.74(6) and $255.86(6) \mathrm{pm}$ ] in 3 are similar to those found in $\mathrm{Sb}(\mathrm{SeMe})_{3}$ [256.8(1)-258.8(1) pm] [17]. The endocyclic angles on the antimony and selenium atoms are both close to $90^{\circ}$ with $\mathrm{Sb}(1)-\mathrm{Se}(1)-\mathrm{Sb}(1)^{*} 88.56(3)^{\circ}$ and $\mathrm{Se}(1)-\mathrm{Sb}(1)-\mathrm{Se}(1)^{*} 90.37(3)^{\circ}$ and describe an almost ideal square. The $\mathrm{Sb}-\mathrm{W}$ bond length [274.91(5) pm] corresponds to the sum of the covalent radii for Sb and W [278 pm] and is similar to the value found in cyclo$(\mathrm{RSbS})_{2}\left[\mathrm{~W}(\mathrm{CO})_{5}\right]_{2}[273.7(7) \mathrm{pm}][12]$. The $\mathrm{Me}_{3} \mathrm{Si}$ groups of the cis alkyl substituents are directed outwards and together with the $\mathrm{W}(\mathrm{CO})_{5}$ groups they shield the molecules from each other. Consequently close intermolecular contacts are not observed in the crystals of 3 . A similar orientation of two $\mathrm{CH}\left(\mathrm{SiMe}_{3}\right)_{2}$ groups exists also in cyclo- $(\mathrm{RSbS})_{2}\left[\mathrm{~W}(\mathrm{CO})_{5}\right]_{2}$ [12] and cyclo $-\mathrm{R}_{3} \mathrm{Sb}_{3}$ $\left[\mathrm{R}=\mathrm{CH}\left(\mathrm{SiMe}_{3}\right)_{2}\right]$ [18]. The formation of $\mathbf{3}$ in the cis form contrasts to the trans orientation of the organic groups in crystals of cyclo $-(\mathrm{RSbO})_{2}\left(\mathrm{R}=2,4,6-\left[\left(\mathrm{Me}_{3}-\right.\right.\right.$ Si) $\left.{ }_{2} \mathrm{CH}\right]_{3} \mathrm{C}_{6} \mathrm{H}_{2}$ ) [9].

## 3. Experimental

NMR spectra were run on a Bruker DPX 200 spectrometer. Chemical shifts are reported in $\delta$ units $(\mathrm{ppm})$ referenced to $\mathrm{C}_{6} \mathrm{D}_{5} \mathrm{H}\left(7.15 \mathrm{ppm},{ }^{1} \mathrm{H}\right)$ and $\mathrm{C}_{6} \mathrm{D}_{6}$ (128.0 ppm, ${ }^{13} \mathrm{C}$ ). Mass spectra were recorded on Finnigan MAT CH7 (A) and Finnigan MAT 8222 spectrometers. The pattern of antimony and bismuthcontaining ions was compared with theoretical values. For the IR spectra a FT-IR SPEKTRUM 1000 instrument was used. The reactions and manipulations were performed in an atmosphere of dry Ar. cyclo-(RSbSe) ${ }_{n}$ $\left[n=2-3 ; \mathrm{R}=\mathrm{CH}\left(\mathrm{SiMe}_{3}\right)_{2}\right][11]$ and $\left[\left(\mathrm{Me}_{3} \mathrm{Si}\right)_{2} \mathrm{CH}\right]_{2} \mathrm{BiCl}$ [16] were prepared according to reported procedures.

### 3.1. Synthesis of <br> bis[bis(bis(trimethylsilyl)methyl)bismuth]sulfide (1)

$0.22 \mathrm{~g}(0.91 \mathrm{mmol}) \mathrm{Na}_{2} \mathrm{~S} \cdot 9 \mathrm{H}_{2} \mathrm{O}$ in 20 ml water were added to a solution of $\left[\left(\mathrm{Me}_{3} \mathrm{Si}_{2} \mathrm{CH}\right]_{2} \mathrm{BiCl}(1 \mathrm{~g}, 1.7\right.$ mmol ) in $60 \mathrm{ml} \mathrm{Et}_{2} \mathrm{O}$. After mixing for 1 h the yellow phase was separated and the water phase was washed twice with 50 ml of $\mathrm{Et}_{2} \mathrm{O}$. The organic phases were dried

Fig. 2. Conformation of the $\mathrm{C}_{2} \mathrm{Bi}-\mathrm{E}-\mathrm{BiC}_{2}$ fragment in (a) $\mathbf{1}$ and (b) $\mathbf{2}$.

Fig. 3. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra in $\mathrm{C}_{6} \mathrm{D}_{6}$ of a photolysed solution of $3(\times)$.

Fig. 4. ORTEP-like representation of $\mathbf{3}$ at $50 \%$ probability showing the atomic numbering scheme.
on $\mathrm{CaSO}_{4}$. Removal of the solvent in vacuum gave 0.85 $\mathrm{g}(88 \%)$ of $\mathbf{1}$ as yellow solid. M.p.: $87^{\circ} \mathrm{C}$ (dec.). ${ }^{1} \mathrm{H}-$ NMR ( $\mathrm{C}_{6} \mathrm{D}_{6}, 200 \mathrm{MHz}$ ): $0.26\left(\mathrm{~s}, 9 \mathrm{H}, \mathrm{SiCH}_{3}\right), 0.41(\mathrm{~s}$, $\left.9 \mathrm{H}, \mathrm{SiC} H_{3}\right), 1.30(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CH}) .{ }^{13} \mathrm{C}$-NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}, 50\right.$ $\mathrm{MHz}): 4.11\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 5.74\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 26.04(\mathrm{~s}, \mathrm{CH}) . \mathrm{MS}$ (EI, 70 eV ) $\mathrm{m} / \mathrm{z}$ (\%): 927 (44) $\left[M^{+}-\mathrm{R}\right], 559$ (6) $\left[\mathrm{R}_{2} \mathrm{BiS}^{+}\right], \quad 527 \quad$ (83) $\quad\left[\mathrm{R}_{2} \mathrm{Bi}^{+}\right], 457 \quad$ (11) $\left[\mathrm{R}\left(\mathrm{MeSiCH}_{2}\right) \mathrm{BiS}^{+}\right], 413$ (9) $\left[\mathrm{R}(\mathrm{CH}) \mathrm{BiS}^{+}\right], 353$ (8) $\left[\mathrm{RBi}^{+}-\mathrm{Me}\right], 129$ (35) $\left[\mathrm{R}^{+}-2 \mathrm{Me}\right], 73$ (92) $\left[\mathrm{Me}_{3} \mathrm{Si}^{+}\right]$ $\mathrm{R}=\mathrm{CH}\left(\mathrm{SiMe}_{3}\right)_{2}$.

### 3.2. Synthesis of bis[bis(bis(trimethylsilyl)methyl)bismuth]telluride (2)

$1.5 \mathrm{~g}(2.66 \mathrm{mmol})\left[\left(\mathrm{Me}_{3} \mathrm{Si}\right)_{2} \mathrm{CH}\right]_{2} \mathrm{BiCl}$ were added at $-60^{\circ} \mathrm{C}$ to $\mathrm{Na}_{2} \mathrm{Te}$ prepared from $0.06 \mathrm{~g}(2.6 \mathrm{mmol}) \mathrm{Na}$ and $0.2 \mathrm{~g}(1.5 \mathrm{mmol}) \mathrm{Te}$ in $60 \mathrm{ml} \mathrm{NH}_{3(1)}$. The reaction
mixture was stirred at $-60^{\circ} \mathrm{C}$ for 3 h and than the solvent $\left(\mathrm{NH}_{3}\right)$ was evaporated. The residue was solved in petroleum ether and a red-brown solution was obtained. The solvent was removed from the petroleum ether solution and $0.84 \mathrm{~g}(53 \%)$ of $\mathbf{2}$ as a red-brown solid was obtained. M.p.: $83^{\circ} \mathrm{C}$ (dec.). ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{C}_{6} \mathrm{D}_{6}\right.$, 200 MHz ): $0.27\left(\mathrm{~s}, 9 \mathrm{H}, \mathrm{SiCH}_{3}\right), 0.40\left(\mathrm{~s}, 9 \mathrm{H}, \mathrm{SiCH}_{3}\right), 1.44$ (s, $1 \mathrm{H}, \mathrm{CH}$ ). MS $\left(\mathrm{DCI}_{\mathrm{pos}}, \mathrm{NH}_{3}\right) m / z(\%): 527$ (28) $\left[\mathrm{R}_{2} \mathrm{Bi}^{+}\right], 449$ (34) $\left[\mathrm{R}_{2} \mathrm{Te}^{+}\right], 377$ (26) $\left[\mathrm{R}_{2} \mathrm{Te}^{+} \cdot \mathrm{NH}_{3}\right.$, $\left.\mathrm{SiMe}_{4}\right], 306$ (20) $\left[\mathrm{RTe}^{+} \cdot \mathrm{NH}_{3}\right], 289$ (8) $\left[\mathrm{RTe}^{+}\right] . \mathrm{MS}$ $\left(\mathrm{DCI}_{\text {neg }}, \mathrm{NH}_{3}\right) m / z(\%): 653(46)\left[\mathrm{R}_{2} \mathrm{BiTe}^{-}\right], 526$ (100) $\left[\mathrm{R}_{2} \mathrm{Bi}^{-}\right], 454$ (49) $\left[\mathrm{R}_{2} \mathrm{Bi}^{-},-\mathrm{SiMe}_{3}\right], 289$ (82) $\left[\mathrm{RTe}^{-}\right]$, 159 (30) $\left[\mathrm{R}^{-}\right] \mathrm{R}=\mathrm{CH}\left(\mathrm{SiMe}_{3}\right)_{2}$.

### 3.3. Synthesis of cyclo-( RSbSe$)_{2}\left[W(\mathrm{CO})_{5}\right]_{2}[R=$ $\mathrm{CH}\left(\mathrm{SiMe}_{3}\right)_{2}$ ] (3)

1.5 g of cyclo $-(\mathrm{RSbSe})_{n}$ and $\mathrm{W}(\mathrm{CO})_{5}$ THF prepared from $1.46 \mathrm{~g}(4.14 \mathrm{mmol}) \mathrm{W}(\mathrm{CO})_{6}$ by irradiation with an UV lamp, in 150 ml of THF were stirred for 4 h at room temperature. Thereafter the solvent was removed under reduced pressure and the remaining brown product was washed twice with 100 ml of petroleum ether. 1.2 g ( $42 \%$ ) of 3 was obtained as brown crystals (dec. $134{ }^{\circ} \mathrm{C}$ ) by cooling petroleum ether solutions to $-28^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}-$ NMR ( $\mathrm{C}_{6} \mathrm{D}_{6}, 200 \mathrm{MHz}$ ): $0.23\left(\mathrm{~s}, 18 \mathrm{H},\left(\mathrm{CH}_{3}\right)_{3} \mathrm{Si},{ }^{1}{ }^{\mathrm{CH}}{ }^{1}=\right.$ $119.3 \mathrm{~Hz}), 0.29(\mathrm{~s}, 1 \mathrm{H}, \mathrm{C} H) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{C}_{6} \mathrm{D}_{6}, 50\right.$ $\mathrm{MHz}): 2.70\left(\mathrm{~s},\left(\mathrm{CH}_{3}\right)_{3} \mathrm{Si}\right), 31.94(\mathrm{~s}, \mathrm{CH}), 196.93(\mathrm{~s}$, $\left.C \mathrm{O}_{\mathrm{eq}}\right), 197.32\left(\mathrm{~s}, \mathrm{CO}_{\mathrm{ax}}\right) . \mathrm{MS}\left(\mathrm{DCI}_{\mathrm{pos}}, \mathrm{NH}_{3}\right) \mathrm{m} / \mathrm{z}(\%):$ 843 (38) $\left[\mathrm{R}_{2} \mathrm{Sb}_{2} \mathrm{SeW}^{+}+\mathrm{NH}_{3}\right], 643$ (100) $\left[\mathrm{R}_{2} \mathrm{Sb}_{2} \mathrm{Se}^{+}\right]$. MS ( $\mathrm{DCI}_{\text {neg }}, \mathrm{NH}_{3}$ ) $m / z(\%): 1281$ (5) $\left[\mathrm{M}^{-}-\mathrm{SiMe}_{4}\right]$, 1122 (8) [ $\left.\mathrm{M}^{-}-\mathrm{SiMe}_{4},-\mathrm{R}\right], 807$ (16) [ $\left.\mathrm{RSb}_{2} \mathrm{SeW}(\mathrm{CO})_{5}^{-}\right]$, 721 (46) $\left[\mathrm{R}_{2} \mathrm{Sb}_{2} \mathrm{Se}_{2}^{-}\right], 642$ (100) $\left[\mathrm{R}_{2} \mathrm{Sb}_{2} \mathrm{Se}^{-}\right], 324$ (52) $\left[\mathrm{W}(\mathrm{CO})_{5}^{-}\right] \quad \mathrm{R}=\mathrm{CH}\left(\mathrm{SiMe}_{3}\right)_{2}$. IR (petroleum ether): 2072s, 1981s, $1950 \mathrm{~s} \mathrm{~cm}^{-1}$ ( $v \mathrm{CO}$ ).

## 4. Supplementary material

Crystallographic data have been deposited with the Cambridge Crystallographic Data Centre, CCDC nos. 185871 for compound 1, 185872 for compound 2, and 185873 for compound 3. Copies of this information may be obtained free of charge from The Director, CCDC, 12 Union Road, Cambridge CB2 IEZ, UK (fax: +44-1223-336033; e-mail: deposit@ccdc.cam.ac.uk or www: http://www.ccdc.cam.ac.uk).
