#### Abstract

Reaction of $\left[\mathrm{Cp}^{*} \mathrm{MCl}_{2}\right]_{2}(\mathbf{1 a}: \mathrm{M}=\mathrm{Rh}$ and $\mathbf{1 b}: \mathbf{M}=\mathrm{Ir})$ or $\left[\left(\mathrm{C}_{6} \mathrm{Me}_{6}\right) \mathrm{RuCl}_{2}\right]_{2}(\mathbf{1 c})$ with bis(diphenylphosphinomethyl)phenylphosphine (dpmp) in the presence of $\mathrm{KPF}_{6}$ generated mono- or dinuclear complexes $[\mathrm{Cp} * \mathrm{RhCl}(\mathrm{dpmp})]\left(\mathrm{PF}_{6}\right)(\mathbf{2 a})$, $\left[\left(\mathrm{C}_{6} \mathrm{Me}_{6}\right) \mathrm{R}-\right.$ $\mathrm{uCl}(\mathrm{dpmp})]\left(\mathrm{PF}_{6}\right)(\mathbf{5 c}),\left[\mathrm{Cp}^{*} \mathrm{MCl}_{2}(\mathrm{dpmp}) \mathrm{MClCp}^{*}\right]\left(\mathrm{PF}_{6}\right)(\mathbf{3 a}: \mathrm{M}=\mathrm{Rh}$ and $\mathbf{4 b}: \mathrm{M}=\mathrm{Ir})$ or $\left[\left(\mathrm{C}_{6} \mathrm{Me}_{6}\right) \mathrm{RuCl}_{2}(\mathrm{dpmp}) \mathrm{RuCl}_{( }\left(\mathrm{C}_{6} \mathrm{Me}_{6}\right)\right]\left(\mathrm{PF}_{6}\right)$ ( $\mathbf{6 c}$ ), depending on reaction conditions. These complexes have two chiral centers and the diastereomers were separated and characterized by spectrometry and X-ray analyses. A diastereomer $\mathbf{2 a}(\mathbf{A})$ was treated with $\mathrm{AuCl}\left(\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{~S}\right)$, generating a heterotetranuclear complex $\left[\left\{\mathrm{Cp}^{*} \mathrm{RhCl}_{2}(\mathrm{dpmp}) \mathrm{Au}_{2}\right]\left(\mathrm{PF}_{6}\right)_{2}(\mathbf{7 a})\right.$, whereas similar reactions of 5c gave dinuclear complex $\left[\left(\mathrm{C}_{6} \mathrm{Me}_{6}\right) \mathrm{R}-\right.$ $\mathrm{uCl}(\mathrm{dpmp}) \mathrm{AuCl}]\left(\mathrm{PF}_{6}\right)(\mathbf{8 c}(\mathbf{A}))$.

Keywords: Pentamethylcyclopentadienyl(rhodium or iridium); (Arene)ruthenium; Bis(diphenylphosphinomethyl)phenylphosphine; Stereochemistry

Triphosphine, especially bis(diphenylphosphinomethyl)phenylphosphine (dpmp), plays an important role as backbone of the construction of polynuclear clusters. A review on its chemistry of rhodium, iridium and gold has been sited by Balch [1]. We have developed systematic syntheses of homo- and hetero-trimetallic platinum and palladium clusters with tridentate phosphine and isocyanide ligands [2]. These complexes are constructed fundamentally by square planar framework and contain dpmp, carbon monoxide, halogens and isocyanides as ligands. Recently, the self-assembled supramolecules with pentamethylcyclopentadienyl or cyclopentadienyl groups have been reported by several groups [3]. Recently, we have reported preparation of

[^0]supramolecular complexes based on quasi-octahedral geometries of rhodium(III) and iridium(III) bearing pentamethylcyclopentadienyl ligand [4]. This type of complexes can lead to compounds with diverse dimensionality, in comparison with square planar complexes. Chemistry on interaction between dpmp and octahedral complexes has attracted our attention. In regard with supramolecules, we were interested in the preparation of polymetallic compounds bearing dpmp and pentamethylcyclopentadienyl (or arenes) ligands, in which the chemistry has not been developed yet. We report the preparation and stereochemistry of mono- and dinuclear complexes of rhodium(III), iridium(III) and ruthenium (II) bearing dpmp and pentamethylcyclopentadienyl ligands.
Reactions of $\left[\mathrm{Cp}^{*} \mathrm{RhCl}_{2}\right]_{2}$ (1a) with dpmp in the presence of $\mathrm{KPF}_{6}$ generated mono- and dinuclear complexes $[\mathrm{Cp} * \mathrm{RhCl}(\mathrm{dpmp})]\left(\mathrm{PF}_{6}\right) \quad$ (2a) $\quad[5]$ and $\left[\mathrm{Cp}_{2}^{*} \mathrm{Rh}_{2} \mathrm{Cl}_{3}(\mathrm{dpmp})\right]\left(\mathrm{PF}_{6}\right)(3 a)[5]$, respectively, depending on the reaction conditions (Scheme 1). Each of these

Scheme 1.
complexes consists of two sets of isomers (A and B) separated by successive recrystallization. On the basis of ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum, the reaction mixture of $\mathbf{2 a}$ consists of an intensity ratio of $2: 1$ for $\mathrm{A}: \mathrm{B}$. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of $\mathbf{2 a}(\mathbf{A})$ showed a triplet at $\delta 1.74$ for $\mathrm{Cp}^{*}$ protons. The ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$-NMR spectrum showed three resonances at $\delta-24.3\left(\mathrm{~d}^{2}{ }^{2} J_{\mathrm{P} 3 \mathrm{P} 2}=81.0 \mathrm{~Hz}, \mathrm{P}^{3}\right),-9.84$ $\left(\mathrm{ddd},{ }^{1} J_{\mathrm{RhP} 2}=118.0 \mathrm{~Hz},{ }^{2} J_{\mathrm{P} 2 \mathrm{P} 1}=105.0 \mathrm{~Hz},{ }^{2} J_{\mathrm{P} 2 \mathrm{P} 3}=\right.$ $81.0 \mathrm{~Hz}, \mathrm{P}^{2}$ ) and -3.11 (dd, ${ }^{1} J_{\mathrm{P} 1 \mathrm{Rh}}=115.5 \mathrm{~Hz}$, ${ }^{2} J_{\mathrm{P} 1 \mathrm{P} 2}=105.0 \mathrm{~Hz}, \mathrm{P}^{1}$ ) for the dpmp ligand. The ${ }^{1} \mathrm{H}-$ NMR spectrum of $\mathbf{2 a}(\mathbf{B})$ showed a triplet at $\delta 1.78$ for Cp * protons. The ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}-\mathrm{NMR}$ spectrum showed three resonances at $\delta-31.1\left(\mathrm{~d},{ }^{2} J_{\mathrm{P} 3 \mathrm{P} 2}=42.0 \mathrm{~Hz}, \mathrm{P}^{3}\right)$, -9.93 (ddd, ${ }^{1} J_{\mathrm{RhP} 2}=112.5 \mathrm{~Hz},{ }^{2} J_{\mathrm{P} 2 \mathrm{P} 1}=100.0 \mathrm{~Hz}$, $\left.{ }^{2} J_{\mathrm{P} 2 \mathrm{P} 3}=42.0 \mathrm{~Hz}, \mathrm{P}^{2}\right)$ and $-5.00\left(\mathrm{dd},{ }^{1} J_{\mathrm{P} 1 \mathrm{Rh}}=116.5\right.$ $\mathrm{Hz},{ }^{2} J_{\mathrm{P} 1 \mathrm{P} 2}=100.0 \mathrm{~Hz}, \mathrm{P}^{1}$ ). The X-ray analysis of $\mathbf{2 a}(\mathbf{A})$ revealed that an Rh atom is connected by terminal and central P atoms and another P atom is free (Fig. 1) [6].

Fig. 1. Molecular structure of $\mathbf{2 a}(\mathbf{A}) . \mathrm{A}_{\mathrm{PF}_{6}}$ was omitted for clarity. Selected bond lengths ( $\AA$ ) and angles $\left({ }^{\circ}\right): \mathrm{Rh}(1)-\mathrm{Cl}(1), 2.389(3)$; $\mathrm{Rh}(1)-\mathrm{P}(1), \quad 2.303(3) ; \quad \mathrm{Rh}(1)-\mathrm{P}(2), \quad 2.338(3) ; \quad \mathrm{Cl}(1)-\mathrm{Rh}(1)-\mathrm{P}(1)$, 83.9(1); $\mathrm{Cl}(1)-\mathrm{Rh}(1)-\mathrm{P}(2), 85.0(1) ; \mathrm{P}(1)-\mathrm{Rh}(1)-\mathrm{P}(2)$, 71.6(1).

This molecule has two chiral centers. Since the priority order of the ligands is $\mathrm{Cp}^{*}>\mathrm{Cl}>\mathrm{P}^{1}>\mathrm{P}^{2}$ for the Rh center and $\mathrm{Rh}>\mathrm{Ph}>\mathrm{C}^{1}>\mathrm{C}^{2}$ for the central $\mathrm{P}^{2}$ atom, where $C^{1}$ and $C^{2}$ is the methylene carbon atoms between $\mathrm{P}^{1}$ and $\mathrm{P}^{2}$ atoms and between $\mathrm{P}^{2}$ and $\mathrm{P}^{3}$ atoms, respectively, complex $\mathbf{2 a}(A)$ is an $R_{R h} S_{P}-S_{R h} R_{P}$ pair. Thus $2 \mathbf{2 a}(\mathbf{B})$ is assumed to be an $R_{R h} R_{P}-S_{R h} S_{P}$ pair.

Complex 3a consists of a population of 1.1:1.0 for $\mathbf{3 a}(\mathbf{A})$ and $\mathbf{3 a}(\mathbf{B})$. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of $\mathbf{3 a}(\mathbf{A})$ showed a doublet at $\delta 1.28$ and a triplet at $\delta 1.55$ for Cp* protons. The ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}-\mathrm{NMR}$ spectrum showed three resonances at $\delta-10.0\left(\mathrm{dt},{ }^{1} J_{\mathrm{Rh} 1 \mathrm{P} 2}={ }^{2} J_{\mathrm{P} 2 \mathrm{P} 1}=\right.$ $\left.104.5 \mathrm{~Hz},{ }^{2} J_{\mathrm{P} 2 \mathrm{P} 3}=55.0 \mathrm{~Hz}, \mathrm{P}^{2}\right),-2.57\left(\mathrm{dd},{ }^{1} J_{\mathrm{P} 1 \mathrm{Rh} 1}=\right.$ 114.5 Hz , and $\left.{ }^{2} J_{\mathrm{P} 1 \mathrm{P} 2}=104.5 \mathrm{~Hz}, \mathrm{P}^{1}\right)$ and $-28.1(\mathrm{dd}$, ${ }^{1} J_{\mathrm{P} 3 \mathrm{Rh} 2}=144.5 \mathrm{~Hz},{ }^{2} J_{\mathrm{P} 3 \mathrm{P} 2}=55.0 \mathrm{~Hz}, \mathrm{P}^{3}$ ). The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of $\mathbf{3 a}(\mathbf{B})$ showed a doublet at $\delta 1.27$ and a triplet at $\delta 1.73$ for $\mathrm{Cp}^{*}$ protons. The ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}-\mathrm{NMR}$ spectrum showed three resonances at $\delta-13.3$ (ddd, ${ }^{1} J_{\mathrm{P} 2 \mathrm{Rh}}=110.5 \mathrm{~Hz},{ }^{2} J_{\mathrm{P} 2 \mathrm{P} 1}=105.5 \mathrm{~Hz},{ }^{2} J_{\mathrm{P} 2 \mathrm{P} 3}=53.5 \mathrm{~Hz}$, $\left.\mathrm{P}^{2}\right),-10.1\left(\mathrm{dd},{ }^{1} J_{\mathrm{P} 1 \mathrm{Rh}}=115.5 \mathrm{~Hz},{ }^{2} J_{\mathrm{P} 1 \mathrm{P} 2}=105.5 \mathrm{~Hz}\right.$, $\left.\mathrm{P}^{1}\right)$ and $-30.1\left(\mathrm{dd},{ }^{1} J_{\mathrm{P} 3 \mathrm{Rh}}=145.0 \mathrm{~Hz},{ }^{2} J_{\mathrm{P} 3 \mathrm{P} 2}=53.5 \mathrm{~Hz}\right.$, $\mathrm{P}^{3}$ ). The X-ray analysis of $\mathbf{3 a}(\mathbf{B})$ revealed that an Rh atom is connected by terminal and central P atoms and another Rh atom is coordinated to another terminal P atom (Fig. 2) [7]. This molecule has two chiral centers. Since the priority order of the ligands is $\mathrm{Cp}^{*}>\mathrm{Cl}>$ $\mathrm{P}^{1}>\mathrm{P}^{2}$ for the Rh center and $\mathrm{Rh}>\mathrm{Ph}>\mathrm{C}^{2}>\mathrm{C}^{1}$ for the central $\mathrm{P}^{2}$ atom, complex $\mathbf{3 a}(\mathbf{B})$ is an $\mathrm{R}_{\mathrm{Rh}} \mathrm{S}_{\mathrm{P}}-\mathrm{S}_{\mathrm{Rh}} \mathrm{R}_{\mathrm{P}}$ pair. Thus $3 \mathbf{a}(\mathbf{A})$ is an $R_{R h} R_{P}-S_{R h} S_{P}$ pair. The geometries around Rh and $\mathrm{P}^{2}$ atoms were found to be similar for $\mathbf{2 a}(\mathbf{A})$ and $\mathbf{3 a}(\mathbf{A})$, and for $\mathbf{2 a}(\mathbf{B})$ and $\mathbf{3 a}(\mathbf{B})$. No isomerization from $\mathbf{2 a}(\mathbf{A})(\mathbf{3 a}(\mathbf{A}))$ to $\mathbf{2 a}(\mathbf{B})(\mathbf{3 a}(\mathbf{B}))$ and its reverse reaction occurred at room temperature. No reaction of $\mathbf{2 a}(\mathbf{A})$ with xylyl isocyanide occurred.

Fig. 2. Molecular structure of $\mathbf{3 a}(\mathbf{B}) . \mathrm{A}_{\mathrm{PF}_{6}}$ anion was omitted for clarity. Selected bond lengths $(\AA)$ and angles $\left({ }^{\circ}\right): \mathrm{Rh}(1)-\mathrm{Cl}(1)$, $2.420(2) ; \mathrm{Rh}(1)-\mathrm{Cl}(2), 2.425 ; \mathrm{Rh}(1)-\mathrm{P}(1), 2.335(2) ; \mathrm{Rh}(2)-\mathrm{Cl}(3)$, $2.375(2) ; \mathrm{Rh}(2)-\mathrm{P}(2), 2.314(2) ; \mathrm{Rh}(2)-\mathrm{P}(3), 2.305(2) ; \mathrm{Cl}(1)-\mathrm{Rh}(1)-$ $\mathrm{Cl}(2), \quad 91.67(7) ; \quad \mathrm{Cl}(1)-\mathrm{Rh}(1)-\mathrm{P}(1), \quad 88.64(5) ; \quad \mathrm{Cl}(2)-\mathrm{Rh}(1)-\mathrm{P}(1)$, 89.93(6); $\mathrm{Rh}(1)-\mathrm{P}(1)-\mathrm{C}(51), \quad 106.9(2) ; \mathrm{P}(1)-\mathrm{C}(51)-\mathrm{P}(2), 129.9(3)$; $\mathrm{Cl}(3)-\mathrm{Rh}(2)-\mathrm{P}(2), \quad 86.02(5) ; \quad \mathrm{Cl}(3)-\mathrm{Rh}(2)-\mathrm{P}(3), \quad 86.58(6) ; \quad \mathrm{P}(2)-$ $\mathrm{Rh}(2)-\mathrm{P}(3), 72.28(5) ; \mathrm{Rh}(2)-\mathrm{P}(3)-\mathrm{C}(52)$, $95.1(2) ; \mathrm{P}(2)-\mathrm{C}(52)-\mathrm{P}(3)$, 95.783; $\mathrm{Rh}(2)-\mathrm{P}(2)-\mathrm{C}(52), 94.8(2)$.

Complex $\mathbf{2 a}(\mathbf{A})$ or $\mathbf{2 a}(\mathbf{B})$ was treated with 1a at room temperature, exclusively generating $\mathbf{3 a}(\mathbf{A})$ or $\mathbf{3 a}(\mathbf{B})$, respectively. Complex $\mathbf{3 a}(\mathbf{A})$ or $\mathbf{3 a}(\mathbf{B})$ was treated with dpmp in a similar way, affording $\mathbf{2 a}(\mathbf{A})$ or $\mathbf{2 a}(\mathbf{B})$, respectively. In these reactions, the conversion from $\mathbf{2 a}(\mathbf{B})$ to $\mathbf{3 a}(\mathbf{B})$ and its reverse reaction are slower than inter-conversion between $\mathbf{2 a}(\mathbf{A})$ and $\mathbf{3 a}(\mathbf{A})$. These reactions proceeded stereospecifically.

When $\left[\mathrm{Cp} * \mathrm{IrCl}_{2}\right]_{2}$ (1b) reacted with dpmp in the presence of $\mathrm{KPF}_{6}$, isolable complexes were orange
$(\mathbf{4 b}(\mathbf{A}))$ and yellow $(\mathbf{4 b}(\mathbf{B}))$ ones having the formula of $\left[\mathrm{Cp}_{2}^{*} \mathrm{Ir}_{2} \mathrm{Cl}_{3}(\mathrm{dpmp})\right]\left(\mathrm{PF}_{6}\right)$ under various reaction conditions, without producing any mono-nuclear complexes [5]. Population of $\mathbf{4 b}(\mathbf{A})$ and $\mathbf{4 b}(\mathbf{B})$ is 1:1.1. In the ${ }^{1} \mathrm{H}$ NMR spectra, $\mathrm{Cp}^{*}$ protons showed a doublet at $\delta 1.27$ and a triplet at $\delta 1.56$ for $\mathbf{4 b}(\mathbf{A})$ and a doublet at $\delta 1.27$ and a triplet at $\delta 1.79$ for $\mathbf{4 b}(\mathbf{B})$. No isomerization was observed standing for 120 h , whereas the treatment of $\mathbf{4 b}(\mathbf{B})$ with xylyl isocyanide led to an isomerization to $\mathbf{4 b}(\mathbf{A})$, almost quantitatively, suggesting that $\mathbf{4 b}(\mathbf{A})$ is superior in stability to $\mathbf{4 b}(\mathbf{B})$ (Eq. (1)). Metallacycle containing the Rh atom showed to be more stable than that containing the Ir atom.
$\mathbf{4 b}(B) \rightarrow \mathbf{4 b}(A)$
The X-ray analysis of $\mathbf{4 b}(\mathbf{A})$ revealed that the structure is essentially similar to that of rhodium analog $\mathbf{3 a}(\mathbf{B})$, and the difference is whether each of Cl atom and $\mathrm{P}^{2}$-phenyl group is located on the opposite side for the former or on the same side for the latter. The molecular structure of $\mathbf{4 b}(\mathbf{A})$ is depicted in Fig. 3 [8].

Reaction of $\left[\left(\mathrm{C}_{6} \mathrm{Me}_{6}\right) \mathrm{RuCl}_{2}\right]_{2}$ (1c) with dpmp was carried out in the presence of $\mathrm{KPF}_{6}$, generating monoand dinuclear complexes $\left[\left(\mathrm{C}_{6} \mathrm{Me}_{6}\right) \mathrm{RuCl}(\mathrm{dpmp})\right]\left(\mathrm{PF}_{6}\right)$ (5c) and $\left[\left(\mathrm{C}_{6} \mathrm{Me}_{6}\right)_{2} \mathrm{Ru}_{2} \mathrm{Cl}_{3}(\mathrm{dpmp})\right]\left(\mathrm{PF}_{6}\right)$ (6c), respectively, depending on reaction conditions [5]. These complexes consist of two diastereomers and the population is $2: 1$ for $\mathbf{5 c}(\mathbf{A}): 5 \mathbf{c}(\mathbf{B})$ and $1: 1.3$ for $\mathbf{6 c}(\mathbf{A}): \mathbf{6 c}(\mathbf{B})$. In the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra, the methyl protons appeared at $\delta$ 1.94 for $\mathbf{5 c}(\mathbf{A})$ and at $\delta 2.06$ for $\mathbf{5 c}(\mathbf{B})$. X-ray analysis of $\mathbf{5 c}(\mathbf{A})$ revealed to be a similar geometry to $\mathbf{2 a}(\mathbf{A})$. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of $\mathbf{6 c}(\mathbf{A})$ showed two singlets at $\delta$ 1.63 and 1.97 for methyl protons. The ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}-\mathrm{NMR}$ spectrum showed three resonances at $\delta-5.41$ (dd, $\left.{ }^{2} J_{\mathrm{P} 2 \mathrm{P} 1}=50.0 \mathrm{~Hz},{ }^{2} J_{\mathrm{P} 2 \mathrm{P} 3}=92.0 \mathrm{~Hz}, \mathrm{P}^{2}\right),-0.07(\mathrm{~d}$,

Fig. 3. Molecular structure of $\mathbf{4 b}(\mathbf{A})$. The $\mathrm{PF}_{6}$ anions were omitted for clarity. Selected bond lengths $(\AA)$ and angles $\left({ }^{\circ}\right): \operatorname{Ir}(1)-\mathrm{Cl}(1), 2.389(3) ; \operatorname{Ir}(1)-$ $\mathrm{P}(1), 2.299(3) ; \operatorname{Ir}(1)-\mathrm{P}(2), 2.318(3) ; \operatorname{Ir}(2)-\mathrm{Cl}(2), 2.408(3) ; \operatorname{Ir}(2)-\mathrm{Cl}(3), 2.430(4) ; \operatorname{Ir}(2)-\mathrm{P}(3), 2.311 ; \mathrm{Cl}(1)-\operatorname{Ir}(1)-\mathrm{P}(1), 85.7(1) ; \mathrm{Cl}(1)-\operatorname{Ir}(1)-\mathrm{P}(2)$, 87.6(1); $\mathrm{P}(1)-\operatorname{Ir}(1)-\mathrm{P}(2), 72.2(1) ; \mathrm{Cl}(2)-\operatorname{Ir}(2)-\mathrm{Cl}(3), 89.0(1) ; \mathrm{Cl}(2)-\operatorname{Ir}(2)-\mathrm{P}(3), 88.9(1)$.

Scheme 2.
$\left.{ }^{2} J_{\mathrm{P} 3 \mathrm{P} 2}=92.0 \mathrm{~Hz}, \mathrm{P}^{1}\right)$ and $-29.3\left(\mathrm{~d},{ }^{2} J_{\mathrm{PIP} 2}=50.0 \mathrm{~Hz}\right.$, $\mathrm{P}^{3}$ ) for the dpmp ligand. The ${ }^{1} \mathrm{H}$-NMR spectrum of $\mathbf{6 c}(\mathbf{B})$ showed two singlets at $\delta 1.63$ and 1.82 for methyl protons. The ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$-NMR spectrum showed three resonances at $\delta-0.49\left(\mathrm{dd},{ }^{2} J_{\mathrm{P} 2 \mathrm{P} 1}=88.5 \mathrm{~Hz},{ }^{2} J_{\mathrm{P} 2 \mathrm{P} 3}=\right.$ $\left.50.0 \mathrm{~Hz}, \mathrm{P}^{2}\right),-2.16\left(\mathrm{~d},{ }^{2} J_{\mathrm{PIP} 2}=88.5 \mathrm{~Hz}, \mathrm{P}^{1}\right)$ and -27.1 $\left(\mathrm{d},{ }^{2} J_{\mathrm{P} 3 \mathrm{P} 2}=50.0 \mathrm{~Hz}, \mathrm{P}^{3}\right)$. No isomerization proceeded in the absence and presence of xylyl isocyanide, suggesting the strong $\mathrm{Ru}-\mathrm{P}$ bond.

Reactions of $\mathbf{2 a}(\mathbf{A})$ or $\mathbf{5 c}(\mathbf{A})$ with $\mathrm{AuCl}\left(\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{~S}\right)$ were carried out, generating $\left[\left\{\mathrm{Cp}^{*} \mathrm{RhCl}_{2}(\mathrm{dpmp}) \mathrm{Au}\right\}_{2}\right]\left(\mathrm{PF}_{6}\right)_{2}$ (7a) or $\left[\left(\mathrm{C}_{6} \mathrm{Me}_{6}\right) \mathrm{RuCl}(\mathrm{dpmp}) \mathrm{AuCl}\right]\left(\mathrm{PF}_{6}\right)(\mathbf{8 c}(\mathbf{A}))$, respectively (Scheme 2) [5]. X-ray analysis of 7a revealed that the molecule has a crystallographically imposed inversion center in the middle of the $\mathrm{Au} \cdots \mathrm{Au}$ * vector (Fig. 4) [9]. Although an $\mathrm{Au} \cdots \mathrm{Au}$ separation of $3.203(2) \AA$ is slightly long in comparison with those of $2.95-3.15 \AA$

Fig. 4. Molecular structure of $\mathbf{7 a}$. The $\mathrm{PF}_{6}$ anions were omitted for clarity. Selected bond lengths $(\AA)$ and angles $\left({ }^{\circ}\right)$ : $\mathrm{Au}-\mathrm{P}(2), 2.336(4)$; $\mathrm{Au}-\mathrm{P}(3), 2.297(4) ; \mathrm{Rh}-\mathrm{Cl}(1), 2.432(5) ; \mathrm{Rh}-\mathrm{Cl}(2), 2.417(3) ; \mathrm{Rh}-\mathrm{P}(1)$, $2.326(4) ; \mathrm{P}(2)-\mathrm{Au}-\mathrm{P}(3), 164.6(1) ; \mathrm{Cl}(1)-\mathrm{Rh}-\mathrm{Cl}(2), 91.8(2) ; \mathrm{Cl}(1) \mathrm{Rh}-$ $\mathrm{P}(1), 87.3(2) ; \mathrm{Cl}(2)-\mathrm{Rh}(1)-\mathrm{P}(1), 88.1(2)$.
found for complexes bearing $\mathrm{Au}-\mathrm{Au}$ bonds [10-12], the weak interaction between two Au atoms is assumed to be present. Each $\mathrm{Cp} * \mathrm{RhCl}_{2}$ moiety is connected by an outer $\mathrm{P}^{1}$ atom of the dpmp ligand. The molecule also has two chiral centers of P 2 and $\mathrm{P} 2^{*}$, with an $\mathrm{R}_{\mathrm{P} 2} \mathrm{~S}_{\mathrm{P} 2^{*-}}$ $\mathrm{S}_{\mathrm{P} 2} \mathrm{R}_{\mathrm{P} 2^{*}}$ pair. It was confirmed by the X-ray analysis of $\mathbf{8 c}(\mathbf{A})$ that the AuCl group coordinated to the free terminal $\mathbf{P}$ atom of $\mathbf{2 a}(\mathbf{A})$ and its stereochemistry was remained to be an RR-SS pair [13].
The research on the mechanism and reactions of those complexes is now in progress.

## 1. Supplementary materials

Spectral data and elementary analyses for all new compounds, an ORTEP of $\mathbf{8 c}(\mathbf{A})$, and X-ray analyses data (anisotropic thermal parameters, bond lengths and bond angles) for $\mathbf{2 a}(\mathbf{A}), \mathbf{3 a}(\mathbf{B}), \mathbf{4 b}(\mathbf{A}), 7 \mathbf{a}$ and $\mathbf{8 c}(\mathbf{A})$ are available. The CCDC numbers of these complexes are 190354, 190353, 202043, 190356 and 202044 for $\mathbf{2 a}(\mathbf{A})$, $\mathbf{3 a}(\mathbf{B}), \mathbf{4 b}(\mathbf{A}), \mathbf{7 a}$ and $\mathbf{8 c}(\mathbf{A})$.

The measurement was made by QuantumCCD/Rigaku AFC7 at $20^{\circ}$. The structure was solved by Patterson methods (DIRDIF92) and refined by full-matrix least-squares techniques using the TEXSAN program package [14].
[8] Crystal data for $\mathbf{4 b}(\mathbf{A}): \mathrm{C}_{52} \mathrm{H}_{59} \mathrm{P}_{4} \mathrm{Cl}_{3} \mathrm{~F}_{6} \mathrm{Ir}_{2}$, monoclinic, space group $P 2{ }_{1} / c$ (no. 14), $a=15.367(2) \AA, b=12.1256(5) \AA, c=$ 28.1703(9) $\AA, \beta=94.345(2)^{\circ}, \quad V=5233.9(6) \AA^{3}, Z=4, \rho_{\text {calc }}=$ $1.793 \mathrm{~g} \mathrm{~cm}^{-3}, R=0.052$ and $R_{\mathrm{w}}=0.098\left[w=1 / \sigma^{2}\left(F_{\mathrm{o}}\right)\right]$ for 8913 reflections $[I>3.0 \sigma(I)]$ with 604 variables. The measurement was made by QuantumCCD/Rigaku AFC7 at $20^{\circ}$. The structure was solved by Patterson methods and refined by full-matrix leastsquares techniques using the TEXSAN program package [14].
[9] Crystal data for 7a: $\mathrm{C}_{84} \mathrm{H}_{88} \mathrm{P}_{8} \mathrm{Cl}_{4} \mathrm{~F}_{12} \mathrm{Au}_{2} \mathrm{Rh}_{2} \mathrm{CH}_{2} \mathrm{Cl}_{2}$, monoclinic, space group $P 2_{1} / n$ (no. 14), $a=13.430(6) \AA, b=13.59(1) \AA, c=$ $24.670(5) \AA, \beta=95.53(3)^{\circ}, V=4480(3) \AA^{3}, Z=2, \rho_{\text {calc }}=1.716 \mathrm{~g}$ $\mathrm{cm}^{-3}, R=0.065$ and $R_{\mathrm{w}}=0.106\left[w=1 / \sigma^{2}\left(F_{\mathrm{o}}\right)\right]$ for 4487 reflections $[I>2.0 \sigma(I)]$ with 505 variables at $27^{\circ}$. The structure was solved by Patterson methods and refined by full-matrix leastsquares techniques using the TEXSAN program package [14].

[13] Crystal data for $\mathbf{8 c}(\mathbf{A})$ : $\mathrm{C}_{45} \mathrm{H}_{49} \mathrm{Cl}_{8} \mathrm{P}_{4} \mathrm{~F}_{6} \mathrm{OAuRu}, \quad M=1283.6$, monoclinic, space group $C 2 / c$ (no. 15), $a=22.123(3) \AA, b=$ 12.8859(4) $\AA, c=35.639(1) \AA, \beta=110.663(2)^{\circ}, V=9506(1) \AA^{3}$, $Z=8, D=1.794 \mathrm{~g} \mathrm{~cm}^{-3}, \mu=38.30 \mathrm{~cm}^{-1}\left(\mathrm{Mo}-\mathrm{K}_{\alpha}\right), F(000)=$ 5056 and $T=293 \mathrm{~K}$. Data were collected on a MSC/ADSC QuantumCCD/Rigaku AFC7. The structure was solved by direct methods and non-hydrogen atoms were refined anisotropically using full-matrix least-squares based on $F$ to give $R_{1}=0.046$ and $R_{\mathrm{w}}=0.073$ for 7619 reflections. The ORTEP appears in the supplementary materials. The structure was solved by Patterson methods and refined by full-matrix least-squares techniques using the TEXSAN program package [14].
