#### Abstract

A new synthesis of cis- $\mathrm{Me}_{4} \mathrm{~N}\left[\mathrm{Au}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right)_{2} \mathrm{Cl}_{2}\right.$ ] (1) is reported, involving the reaction of $\left[\mathrm{Hg}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right) \mathrm{Cl}\right]$ with $\mathrm{Me}_{4} \mathrm{~N}\left[\mathrm{AuCl}_{4}\right]$ in the presence of $\mathrm{Me}_{4} \mathrm{NCl}$. Reaction of 1 with NaOPh or with Tlacac (acac = acetylacetonate) in the presence of $\mathrm{NaClO}_{4}$ yields $\mathrm{Na}\left[\mathrm{Au}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right)_{2}(\mathrm{OPh})_{2}\right]$ (2) or cis-[ $\left.\mathrm{Au}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right)_{2}(\mathrm{O}, \mathrm{O}-\mathrm{acac})\right]$ (3), respectively. Complex 3 reacts with $\mathrm{PPh}_{3}$ to give trans- $\left[\mathrm{Au}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right)_{2}(\mathrm{C}-\mathrm{acac})\left(\mathrm{PPh}_{3}\right)\right]$ (4). Treatment of 2 in acetone with NaOH gives $\left[\mathrm{Au}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right)_{2}(\mu-\mathrm{OH})\right]_{2}(5)$, which is also formed when a solution of $2 \mathrm{in} \mathrm{CHCl}_{3}$ /hexane is exposed to water. The crystal structure of $5 \cdot 2 \mathrm{Et}_{2} \mathrm{O}$ shows that it is a centrosymmetric dimer with two hydroxo groups bridging two $\mathrm{Au}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right)$ moieties. The features of the structure include short $\mathrm{Au}-\mathrm{C}$ bond distances (1.992(5) $\AA, 1.995(5) \AA$ ) and hydrogen bonding between the bridging OH groups and diethyl ether molecules.

Keywords: Gold; Crystal structure; Acetylacetonato $\mu$-hydroxo complexes

## 1. Introduction

Few organogold(III) complexes with oxoanionic ligands are known and many of them are unstable or moisture sensitive [1]. Thus, $\left[\mathrm{AuMe}_{2}(\mathrm{OH})\right]_{4}$ detonates when dry just by touching [2], and the complexes [ $\mathrm{AuMe}_{2}(\mathrm{X}) \mathrm{L}$ ], where $\mathrm{X}=\mathrm{ClO}_{4}, \mathrm{CF}_{3} \mathrm{SO}_{3}, p-\mathrm{MeC}_{6} \mathrm{H}_{4}-$ $\mathrm{SO}_{3}$ or $\mathrm{NO}_{3}$ and $\mathrm{L}=\mathrm{PPh}_{3}$, decompose at room temperature to give ethane and $[\mathrm{Au}(\mathrm{X}) \mathrm{L}]$ [3]. [ $\mathrm{AuMe}_{2}{ }^{-}$ $\left.\left(\mathrm{OSiMe}_{3}\right)\right]_{2}$ is thermally stable but sensitive to moisture [4]. As far as we are aware, only three 0,0-acetylace-tonato- complexes are known [5], and no HO- or ROarylgold(III) complexes. This paper reports the synthesis of new $\mathrm{O}, \mathrm{O}$-acetylacetonato- and the first HO- and RO-arylgold(III) complexes, advantage being taken of the high stability of the $\mathrm{C}-\mathrm{Au}$ bonds in orthonitrophenyl gold complexes [6].

[^0]
## 2. Results and discussion

The synthesis of cis-Me ${ }_{4} \mathrm{~N}\left[\mathrm{Au}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right)_{2} \mathrm{Cl}_{2}\right]$ (1) has been achieved by transmetallation ( $1: 1$, refluxing 18 h in acetone) [7]:

$$
\begin{gathered}
2\left[\mathrm{Hg}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right)_{2}\right]+\left[\mathrm{AuCl}_{4}\right]^{-} \\
\rightarrow\left[\mathrm{Au}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right)_{2} \mathrm{Cl}_{2}\right]^{-} \\
\quad+2\left[\mathrm{Hg}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right) \mathrm{Cl}\right]
\end{gathered}
$$

However, because $\mathrm{Me}_{4} \mathrm{NCl}$ symmetrizes the by-product $\left[\mathrm{Hg}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right) \mathrm{Cl}\right]$,

$$
\begin{aligned}
& 2\left[\mathrm{Hg}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right) \mathrm{Cl}\right]+\mathrm{Cl}^{-} \\
& \quad \rightarrow\left[\mathrm{Hg}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right)_{2}\right]+\left[\mathrm{HgCl}_{3}\right]^{-}
\end{aligned}
$$

it is possible to improve the yield of 1 , with respect to the nitrophenyl group, by carrying out the reaction of $\mathrm{Me}_{4} \mathrm{~N}\left[\mathrm{AuCl}_{4}\right]$ with $\left[\mathrm{Hg}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right) \mathrm{Cl}\right]$ in the presence of $\mathrm{Me}_{4} \mathrm{NCl}$ (1:2:2, EtOH, refluxing 5 h , see Scheme
$\mathrm{Me}_{4} \mathrm{~N}\left[\mathrm{AuCl}_{4}\right]+2\left[\mathrm{Hg}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right) \mathrm{Cl}\right]+2 \mathrm{Me}_{4} \mathrm{NCl}$

(3)

Scheme 1.
1). We have previously used a similar method to prepare $\left[\mathrm{Au}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right) \mathrm{Cl}\right]^{-}$[8].

Reactions of 1 with $\mathrm{NaOR}(\mathrm{R}=\mathrm{Me}, \mathrm{Et})$ gave metallic gold even at low temperature and under an inert atmosphere. However, 1 reacts with NaOPh (1:3, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, room temperature) to give $\mathrm{Na}\left[\mathrm{Au}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}\right.\right.$ $\left.-2)_{2}(\mathrm{OPh})_{2}\right]$ (2). As far as we are aware, 2 is the first arylgold(III) species containing an $\mathrm{RO}^{-}$ligand. Some aryl- or alkyl-oxodimethylgold(III) complexes (Au$\left.\mathrm{Me}_{2}(\mathrm{OR}) \mathrm{PPh}_{3}\right)\left(\mathrm{R}=\mathrm{Ph}\right.$, tolyl, $\left.\mathrm{CH}_{2} \mathrm{CF}_{3}, \mathrm{CH}\left(\mathrm{CF}_{3}\right)_{2}\right)$ have recently been reported [9]. The complex $\left[\mathrm{AuMe}_{2}(\mathrm{OH})\right]_{4}$ dissolves in aqueous NaOH to give a solution which is believed to contain $\mathrm{Na}\left[\mathrm{AuMe}_{2}(\mathrm{OH})_{2}\right]$ [10].

Tlacac (acac $=$ acetylacetonate) reacts with 1 , in the presence of $\mathrm{NaClO}_{4}$, (1:1, acetone) to give cis$\left[\mathrm{Au}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right)_{2}(\mathrm{O}, \mathrm{O}-\mathrm{acac})\right]$ (3). If the reaction is carried out in the absence of $\mathrm{NaClO}_{4}$, a mixture of 1 and 3 is obtained, probably because formation of the partially soluble $\mathrm{Me}_{4} \mathrm{NCl}$ leads to establishment of the equilibrium $\mathbf{3}+2 \mathrm{Cl}^{-} \leftrightarrow \mathbf{1}+\mathrm{acac}^{-}$. When $\mathrm{NaClO}_{4}$ is present formation of the insoluble NaCl and $\mathrm{Me}_{4} \mathrm{NClO}_{4}$ displaces the equilibrium towards 3 . As far as we are aware, only two other ( $\mathrm{O}, \mathrm{O}-\mathrm{acac}$ )diarylgold(III) complexes $\left(\operatorname{cis}-\left[\mathrm{Au}(\mathrm{R})_{2}(\mathrm{O}, \mathrm{O}-\mathrm{acac})\right)\left(\mathrm{R}=2,2^{\prime}\right.\right.$-biphenyl [5a], $\mathrm{C}_{6} \mathrm{~F}_{5}$ [5b]) and one cationic ( $\mathrm{O}, \mathrm{O}-\mathrm{acac}$ )monoarylgold(III) complex ( $\left[\mathrm{Au}\left(\mathrm{C}, \mathrm{N}^{\prime}-\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{~N}=\mathrm{NPh}-2\right)(\mathrm{O}, \mathrm{O}-\right.$ $\mathrm{acac}) \mathrm{ClO}_{4}$ [5c]) have been described. The complex [ $\mathrm{AuMe}_{2}(\mathrm{O}, \mathrm{O}-\mathrm{acac})$ ] was reported long ago [11]. Addition of $\mathrm{PPh}_{3}$ to 3 (1:1, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, room temperature)
gives trans-[ $\left.\mathrm{Au}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right)_{2}(\mathrm{C}-\mathrm{acac})\left(\mathrm{PPh}_{3}\right)\right](4)$ in which the acac ligand is C -bonded rather than $\mathrm{O}, \mathrm{O}$ bonded and the cis geometry has changed to trans (as indicated by ${ }^{1} \mathrm{H}$ NMR spectroscopy, as described below). The reaction of $\left[\mathrm{AuMe}_{2}(\mathrm{O}, \mathrm{O}-\mathrm{acac})\right]$ with tertiary phosphines results in formation of an equilibrium with cis-[ $\left.\mathrm{AuMe}_{2}(\mathrm{C}-\mathrm{acac})\left(\mathrm{PR}_{3}\right)\right]$. Only in the case of $\mathrm{PMe}_{2} \mathrm{Ph}$ could the C -acac complex be isolated [12]. Activation of C-H bonds in ketones (MeCOR) takes place with some ( C -acac)(2-phenylazophenyl)gold(III) derivatives to give ketonyl complexes [ 5 c ]. The fact that $\mathbf{3}$ and $\mathbf{4}$ are stable in acetone is in accordance with the proposed pathway for this $\mathrm{C}-\mathrm{H}$ activation process [5c].

Attempts were made to grow single crystals of 2 by the liquid diffusion method using $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{n}$-hexane. The only suitable crystals obtained for X-ray diffraction turned out to be of $\left[\mathrm{Au}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right)_{2}(\mu-\mathrm{OH})\right]_{2}$. $2 \mathrm{Et}_{2} \mathrm{O}(5)$, presumably as a result of reaction with traces of water. This hydroxo-bridged complex was also made, although in low yield because of partial reduction to metallic gold, by reaction of $\mathbf{1}$ with NaOH . The homologous methylgold(III) derivative is a tetramer $\left[\mathrm{AuMe}_{2}(\mu-\mathrm{OH})\right]_{4}$ [2] whereas 1 -hydroxo-2,3,4,5-tetraphenylauracyclopentadiene is, like complex 5 , a dimer [13]. When dilute aqueous HCl was added to 5 , reaction took place with decomposition and no pure chloro complex was isolated.

Reactions between complex 2 and various protic acids did not lead to new complexes. Thus, 2 was stirred in acetone in an attempt to obtain new acetonylgold(III) complexes by $\mathrm{C}-\mathrm{H}$ activation [5c], but no reaction was observed. Although some reaction took place with phenylacetylene in solution, as indicated by a change in colour from colourless to yellow, the starting complex was recovered unchanged after partial removal of the solvent and addition of $\mathrm{Et}_{2} \mathrm{O} / \mathrm{n}$-hexane. Equilibrium reactions have previously been described between phenoxogold(III) complexes, cis-[AuMe $\left.{ }_{2}(\mathrm{OPh})\left(\mathrm{PPh}_{3}\right)\right]$, and $\mathrm{RH}=$ methylcyanoacetate, malononitrile or phenylacetylene [9]. However, while the first gave a mixture of the starting complex and cis-[ $\left.\mathrm{AuMe}_{2}(\mathrm{R})\left(\mathrm{PPh}_{3}\right)\right]$, the latter two gave the corresponding $\mathrm{R}-\mathrm{Au}(\mathrm{III})$ complexes. Complexes 3 and $\mathbf{4}$ were also recovered unchanged after treatment with phenylacetylene. This is in contrast with the observed behaviour of acetylacetonatogold(I) complexes towards alkynes [14].

### 2.1. Spectroscopic properties and structure of the com-

 plexes.
### 2.1.1. IR spectra

The phenoxo derivative 2 shows strong bands in the region $1250-1300 \mathrm{~cm}^{-1}$ assignable to $\nu(\mathrm{C}-\mathrm{O})$ [9], and strong bands at 690 and $760 \mathrm{~cm}^{-1}$, typical of monosub-
stituted phenyl groups ( PhO ). This last set of bands is not observed for the hydroxo species 5 . The acac complex 3 shows $\nu(\mathrm{CO})$ at 1550 and $1570 \mathrm{~cm}^{-1}$, while the phosphine adduct 4 shows broad bands at 1650 and $1675 \mathrm{~cm}^{-1}$ as expected for chelating 0,O-acac and terminal C -acac groups, respectively [5c]. All the complexes show bands at $1330-1340 \mathrm{~cm}^{-1}$ and ca. 1510 $\mathrm{cm}^{-1}$, which have been shown to correspond to $\nu_{\text {sym }}\left(\mathrm{NO}_{2}\right)$ and to $\nu_{\text {asym }}\left(\mathrm{NO}_{2}\right)$, respectively, when the nitrophenyl group is not coordinated to the metal centre [15].

### 2.1.2. NMR spectra

The ${ }^{1} \mathrm{H}$ NMR spectrum of the acac complex 3 shows a singlet resonance at 2.0 ppm for methyl groups and at 5.5 ppm for the methynic proton. This resonance appears in 4 as a doublet at $4.2 \mathrm{ppm}\left({ }^{3} \mathrm{~J}_{\mathrm{HP}}=12 \mathrm{~Hz}\right) .{ }^{13} \mathrm{C}$ NMR of $\mathbf{4}$ shows only one resonance for the C attached to the nitro group ( 151.8 ppm ) and 12 resonances in the range $122-135 \mathrm{ppm}$. The methyne carbon gives a doublet at 67.62 ppm with ${ }^{2} \mathrm{~J}_{\mathrm{CP}}=86 \mathrm{~Hz}$. These data indicate a trans geometry for 4 . The antisymbiotic effect has proved useful in understanding some related changes in geometry in arylpalladium(II) complexes [16]. In terms of this effect, an aryl and a phosphine ligand should have a destabilizing effect on each other when attached to class b metal ions such as palladium(II). No resonance assignable to $\mu$-hydroxo protons was observed in the ${ }^{1} \mathrm{H}$ NMR spectrum of 5 . The same feature has been reported for other bridging hydroxo complexes [17].

### 2.2. Crystal structure of complex 5

The crystal structure of $\mathbf{5}$ is the first for a nitroarylgold(III) complex (see Fig. 1). The complex displays crystallographic inversion symmetry and the central $\mathrm{Au}_{2} \mathrm{O}_{2}$ ring is thus exactly planar; the transannular $\mathrm{Au} \ldots \mathrm{Au}$ distance is $3.150(1) \AA$. The coordination at

Fig. 1. The structure of compound 5 in the crystal. Radii are arbitrary.
gold is, as expected, planar, with a mean deviation of $0.06 \AA$. The $\mathrm{Au}-\mathrm{C}$ bond distances (1.992(5) $\AA$, 1.995(5) $\AA$ ) are among the shortest $\mathrm{Au}(\mathrm{III})-\mathrm{C}$ bond distances so far reported [18]. The only two other crystal structures reported of hydroxoorganogold(III) complexes ( $\left[\mathrm{AuMe}_{2}(\mathrm{OH})\right]_{4}[19]$ and 1-hydroxo-2,3,4,5-tetraphenylauracyclopentadiene [13b]) were not of sufficient accuracy to allow comparison with the data for complex 5. The $\mathrm{Au}-\mathrm{O}$ distances $(2.073(4) \AA$, 2.075(4) $\AA$ ) in 5 are longer than in $\mathrm{Sr}\left[\mathrm{Au}(\mathrm{OH})_{4}\right]_{2}(1.980(8) \AA$ ) [20]. This difference can partly be attributed to the change from a bridging to a terminal OH ligand. Thus, in $\left[\mathrm{Au}_{2} \mathrm{O}_{6}\right]^{6-}$ the $\mathrm{Au}-\mathrm{O}$ distances are $2.17 \AA$ and $2.12 \AA$, respectively [21]. Additionally, the greater trans influence of an aryl than of an OH ligand must be taken into account.

Each nitro group is inclined to its own aryl ring (N1 by $35^{\circ}$, N 2 by $20^{\circ}$ ) and in an anti disposition with respect to the hydrogen of the neighbouring cis- OH group. The OH hydrogen atoms are (necessarily) mutually trans and both are hydrogen bonded to a diethyl ether molecule ( $\mathrm{O} \ldots \mathrm{O} 2.700(5) \AA, \mathrm{O}-\mathrm{H} \ldots \mathrm{O} 178^{\circ}$ ).

The presence of the nitro group causes significant widening of the corresponding $\mathrm{C}-\mathrm{C}\left(\mathrm{NO}_{2}\right)-\mathrm{C}$ angle $\left(123.0(5)^{\circ}, 123.9(5)^{\circ}\right)$ with little change in the bond distances of the aryl ring (1.375(8)-1.404(8) $\AA$ ). The opposite effect is observed for the $\mathrm{C}-\mathrm{C}(\mathrm{Au})-\mathrm{C}$ bond angle $\left(117.0(5)^{\circ}, 115.6(5)^{\circ}\right)$. Both facts have been attributed to the operation of the -I rather than the -M effect of the nitro group [22]. The $\mathrm{C}-\mathrm{N}$ (1.477(7) $\AA$, $1.498(7) \AA)$ and $\mathrm{N}-\mathrm{O}(1.211(6)-1.230(7) \AA)$ bond distances are similar to those previously reported [22]. The short intramolecular $\mathrm{ONO} \ldots \mathrm{Au}$ distances ( $\mathrm{Au} \ldots \mathrm{O} 2$ $2.866 \AA, \mathrm{Au} \ldots \mathrm{O} 4.845 \AA$ ) correspond to weak axial interactions.

## 3. Experimental section

The compound $\left[\mathrm{Hg}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right) \mathrm{Cl}\right]$ was prepared as previously described [23]. Reactions were carried out at room temperature and NMR spectra were recorded on a Bruker AC-200 or a Varian XL-300 spectrometer, and referenced to internal $\mathrm{SiMe}_{4}\left({ }^{1} \mathrm{H},{ }^{13} \mathrm{C}\right)$ or external $\mathrm{H}_{3} \mathrm{PO}_{4}$ $\left({ }^{31} \mathrm{P}\right)$ unless otherwise stated.

## 3.1. $\left.\mathrm{Cis}^{-M e}{ }_{4} \mathrm{NLAu}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right)_{2} \mathrm{Cl}_{2}\right]$ (1)

To a yellow solution of $\mathrm{Me}_{4} \mathrm{~N}\left[\mathrm{AuCl}_{4}\right]$ ( $530 \mathrm{mg}, 1.30$ mmol ) in EtOH ( $50 \mathrm{~cm}^{3}$ ) were added solid $\left[\mathrm{Hg}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right) \mathrm{Cl}\right](919 \mathrm{mg}, 2.60 \mathrm{mmol})$ and $\mathrm{Me}_{4} \mathrm{NCl}(2.64 \mathrm{mg}, 2.70 \mathrm{mmol})$. The mixture was stirred under reflux until complete (ca. 5 h ). The solvent was removed decoloration and the residue extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(3 \times 5 \mathrm{~cm}^{3}\right)$. The extract was filtered through anhydrous $\mathrm{MgSO}_{4}$ and the filtrate evaporated to ca. 1 $\mathrm{cm}^{3}$. Addition of $\mathrm{Et}_{2} \mathrm{O}\left(15 \mathrm{~cm}^{3}\right)$ afforded a white
precipitate which was recrystallized from $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ $\mathrm{Et}_{2} \mathrm{O}$ ( $629 \mathrm{mg}, 1.10 \mathrm{mmol}$ ) to give 1 [7]. Yield, $84 \%$; ${ }^{1}{ }^{\mathrm{H}} \mathrm{NMR}$ (DMSO): $\delta 3.10\left(\mathrm{~s}, 12 \mathrm{H}, \mathrm{Me}_{4} \mathrm{~N}^{+}\right.$), $7.22(\mathrm{~m}$, $2 \mathrm{H}, \mathrm{C}_{6} \mathrm{H}_{4}$ ), $7.33\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{C}_{6} \mathrm{H}_{4}\right), 7.52\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{C}_{6} \mathrm{H}_{4}\right)$, 7.87 (m, 2H, H3) ppm; ${ }^{13} \mathrm{C}$ NMR (DMSO): $\delta 150.97$ (C2), 125.32, 126.27, 133.74, 135.12 (C1, C3-C6, two nuclei must be accidentally isochronous), 54.58 $\left(\mathrm{Me}_{4} \mathrm{~N}^{+}\right)$, ppm.

## 3.2. $\mathrm{Na}\left[\mathrm{Au}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right)_{2}(\mathrm{OPh})_{2}\right]$

Solid 1 ( $189 \mathrm{mg}, 0.33 \mathrm{mmol}$ ) was added to a suspension of $\mathrm{NaOPh}(170 \mathrm{mg}, 0.99 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 30 $\mathrm{cm}^{3}$ ), and the mixture stirred for 6 h . The solution was then filtered through anhydrous $\mathrm{MgSO}_{4}$ and the filtrate evaporated to ca. $1 \mathrm{~cm}^{3}$. Addition of $\mathrm{Et}_{2} \mathrm{O} / \mathrm{n}$-hexane ( $1: 1,10 \mathrm{~cm}^{3}$ ) produced a pale yellow precipitate which was filtered off, washed with $\mathrm{Et}_{2} \mathrm{O}$ and dried under vacuum. Yield, $64 \%$; M.p. $100^{\circ} \mathrm{C}$ (decomp.); $\Lambda_{\mathrm{M}}=87$ $\Omega^{-1} \mathrm{~cm}^{2} \mathrm{~mol}^{-1}\left(5 \times 10^{-4} \mathrm{~mol} \mathrm{dm}{ }^{-3}\right) ;{ }^{1} \mathrm{H}$ NMR: $\delta$ $6.44(\mathrm{~m}, 2 \mathrm{H}), 6.73(\mathrm{~m}, 4 \mathrm{H}), 7.55\left(\mathrm{~m}, 10 \mathrm{H}, \mathrm{C}_{6} \mathrm{H}_{4}+\right.$ PhO ), 7.85 (m, 2H, H3) ppm. Anal. Calc. for $\mathrm{C}_{24} \mathrm{H}_{18} \mathrm{AuN}_{2} \mathrm{NaO}_{6}$ : C, 44.3; H, 2.8; N, 4.3; $\mathrm{Au}, 30.3 \%$. Found: C, 43.9; H, 3.0; N, 4.1; Au, 30.7\%.

## 3.3. $\left[\mathrm{Au}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right)_{2}(\mathrm{O}, \mathrm{O}-\mathrm{acac})\right]$ (3)

To an acetone solution ( $50 \mathrm{~cm}^{3}$ ) of 1 ( $56 \mathrm{mg}, 0.10$ mmol ) were added solid $\mathrm{Tl}(\mathrm{acac})$ (acac $=$

Symmetry transformation used to generate equivalent atoms: \#1; $-x+1,-y+1,-z+1$.
acetylacetonate) ( $29.5 \mathrm{mg}, 0.10 \mathrm{mmol}$ ) and $\mathrm{NaClO}_{4}$ ( $13.2 \mathrm{mg}, 0.09 \mathrm{mmol}$ ). The mixture was stirred for 7 h and the solvent was then removed. The residue was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(2 \times 5 \mathrm{~cm}^{3}\right)$ and the solid filtered through anhydrous $\mathrm{MgSO}_{4}$. Evaporation of the filtrate to a volume of ca. $1 \mathrm{~cm}^{3}$ and addition of $\mathrm{Et}_{2} \mathrm{O}$ ( $10 \mathrm{~cm}^{3}$ ) gave a white precipitate ( $40 \mathrm{mg}, 0.07 \mathrm{mmol}$ ) which was recrystallized from $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{Et}_{2} \mathrm{O}$. Yield, $75 \%$; M.p., $205^{\circ} \mathrm{C}$ (decomp.); ${ }^{1} \mathrm{H}$ NMR: $\delta 2.00$ (s, 6 H , Me ), 5.47 ( $\mathrm{s}, 1 \mathrm{H}, \mathrm{CH}$ ), $7.30(\mathrm{~m}, 4 \mathrm{H}, \mathrm{H} 4, \mathrm{H} 5$ ), 7.52 (m, $2 \mathrm{H}, \mathrm{H} 6$ ) 8.00 (m, 2H, H3) ppm. Anal. Calc. for $\mathrm{C}_{17} \mathrm{H}_{15} \mathrm{AuN}_{2} \mathrm{O}_{6}: \mathrm{C}, 37.8 ; \mathrm{H}, 2.8 ; \mathrm{N}, 5.2 ; \mathrm{Au}, 36.5 \%$. Found: C, 37.6; H, 2.4; N, 5.1; Au, $36.8 \%$.

## 3.4. $\operatorname{Trans}-\left[\mathrm{Au}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right)_{2}(\mathrm{C}-\mathrm{acac})\left(\mathrm{PPh}_{3}\right)\right]$

Solid $\mathrm{PPh}_{3}(26 \mathrm{mg}, 0.10 \mathrm{mmol})$ was added to a $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution ( $30 \mathrm{~cm}^{3}$ ) of $\mathbf{3}(53 \mathrm{mg}, 0.10 \mathrm{mmol})$ and the mixture stirred for 3 h . The solvent was evaporated to a volume of ca. $1 \mathrm{~cm}^{3}$ and $\mathrm{Et}_{2} \mathrm{O} / \mathrm{n}$-hexane ( $1: 1,10$ $\mathrm{cm}^{3}$ ) added to give a pale yellow precipitate ( 68 mg , 0.09 mmol ). Yield, $89 \%$; M.p., $165^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR: $\delta$ $2.00(\mathrm{~s}, 6 \mathrm{H}, \mathrm{Me}), 4.23\left[\mathrm{~d}, 1 \mathrm{H}, \mathrm{CH},{ }^{3} \mathrm{~J}_{\mathrm{HP}}=12 \mathrm{~Hz}\right.$ ], $7.28-7.77\left(\mathrm{~m}, 21 \mathrm{H}, \mathrm{C}_{6} \mathrm{H}_{4}+\mathrm{PPh}_{3}\right.$ ), 8.40 [d, $2 \mathrm{H}, \mathrm{H} 3$, $\left.{ }^{3} \mathrm{~J}_{\mathrm{HH}}=8 \mathrm{~Hz}\right] \mathrm{ppm} ;{ }^{31} \mathrm{P}$ NMR, $\delta 24.93 \mathrm{ppm} ;{ }^{13} \mathrm{C}$ NMR, $\delta 206.00$ (CO), 151.87 (C2), $134.38,134.12,133.90$, $132.59,131.84,131.79,130.99,129.25,128.97,128.75$, 126.34, 122.97 (C1, C3-C6, Ph), 67.62 (CH), 30.62 (Me) ppm. Anal. Calc. for $\mathrm{C}_{35} \mathrm{H}_{30} \mathrm{AuN}_{2} \mathrm{O}_{6} \mathrm{P}$ : C, 52.4; H, 3.8; N, 3.5; Au, 24.5\%. Found: C, 52.4; H, 3.9; N, 3.2; Au, $24.1 \%$.
3.5. $\left[\mathrm{Au}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}-2\right)_{2}(\mu-\mathrm{OH})_{2}\right]_{2}$

Solid $\mathrm{NaOH}(31.2 \mathrm{mg}, 0.78 \mathrm{mmol})$ was added to an acetone solution ( $25 \mathrm{~cm}^{3}$ ) of $1(150 \mathrm{mg}, 0.26 \mathrm{mmol})$
and the suspension was stirred for 15 h , during which decomposition to metallic gold was observed. Evaporation of the solvent, extraction of the residue with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and filtration of the extract through Celite gave a yellow solution which was concentrated to a volume of ca. 1 $\mathrm{cm}^{3}$. Addition of n -hexane ( $20 \mathrm{~cm}^{3}$ ) gave a pale yellow precipitate which was recrystallized from $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{n}$ hexane. Yield, $35 \%$; M.p., $210^{\circ} \mathrm{C}$ (decomp.). ${ }^{1} \mathrm{H}$ NMR: $\delta$ 7.9-6.4 (m, aryl) ppm. Anal. Calc. for $\mathrm{C}_{24} \mathrm{H}_{18} \mathrm{Au}_{2} \mathrm{~N}_{4} \mathrm{O}_{10}: \mathrm{C}, 31.5 ; \mathrm{H}, 2.0 ; \mathrm{N}, 6.1 ; \mathrm{Au}, 43.0 \%$. Found: C, 32.1; H, 2.3; N, 5.7; Au, 43.4\%.

Crystal data. $\mathrm{C}_{32} \mathrm{H}_{38} \mathrm{Au}_{2} \mathrm{~N}_{4} \mathrm{O}_{12}, M_{\mathrm{r}}=1064.6$, orthorhombic, Pbca, $a=14.801(2) \AA, b=14.788(3) \AA$, $c=16.627(2) \AA, V=3639.4 \AA^{3}, Z=4, D_{\mathrm{x}}=1.943 \mathrm{Mg}$ $\mathrm{m}^{-3}, \lambda(\mathrm{Mo} \mathrm{K} \alpha)=0.71073 \AA, \mu=8.2 \mathrm{~mm}^{-1}, F(000)$ $=2048, T=-130^{\circ} \mathrm{C}$.

Data collection and reduction. A colourless flattened pyramid ca. $0.45 \times 0.4 \times 0.2 \mathrm{~mm}^{3}$ was mounted in inert oil and transferred to the cold gas stream of the diffractometer (Siemens P4 with LT-2 low temperature attachment). A total of 3671 unique intensities were measured to $2 \theta=50^{\circ}$. Cell constants were refined from setting angles of 65 reflections to $2 \theta=25^{\circ}$. An absorption correction based on $\psi$-scans gave transmission factors 0.55-0.97.

Structure solution and refinement. The structure was solved by the heavy-atom method and refined on $F^{2}$ using the program shelxi-93. The hydroxyl H atom was refined with DFIX; others were included with a riding model. The weighting scheme was $w^{-1}=\left[\sigma^{2}\left(F_{0}^{2}\right)+\right.$ $\left.(0.034 P)^{2}\right]$, with $P=\left(F_{0}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$. The final $w R\left(F^{2}\right)$ for all reflections was 0.059 , with a conventional $R(F)$ of 0.026 for 2201 reflections with $I>2 \sigma I$, for 230 parameters; $S=0.88$, max. $\Delta / \sigma=0.001$, max. $\Delta \rho=$ $1.0 \mathrm{e}^{\AA} \AA^{-3}$. Final atomic coordinates are given in Table 1 , with selected bond lengths and angles in Table 2.

Full details of the structure determination have been deposited at the Fachinformationszentrum Karlsruhe, Gesellschaft für wissenschaftlich-technische Information mbH, D-76344 Eggenstein-Leopoldshafen, Germany, from where this material can be obtained on quoting the full literature citation and the reference number CSD 401615.

## Acknowledgments

We thank Dirección General de Investigación Científica y Técnica (PB92-0982-C) and the Fonds der Chemischen Industrie for financial support. FJC is
grateful to Ministerio de Educación y Ciencia (Spain) for a grant.
