In our paper we gave in Table 1 the retention indices of a number of compounds tentatively identified in *Capsicum annuum* by their mass spectra. We realize now, through a compound of errors that some or many of these identifications are incorrect. The essential findings of this work, that healthy peppers are characterized by the presence of large amounts of 3-hydroxypyridine, while a number of other volatile and odorous compounds, including indole derivatives characterize the infected peppers.

We regret this mistake, and hope this notice can avoid confusion for readers of the journal.
