Received 23 August 1973

**Abstract.** A method for carrying out the angular momentum analysis

$$SU(2l+1) \supset O^+(2l+1) \supset O^+(3)$$

is discussed using Littlewood's  $S$  function technique. Results for  $l = 4$  are tabulated.

### 1. Introduction

Syamala Devi (1972) discussed the problem of finding the  $O^+(3)$  content of an irreducible representation (IR) of  $SU(2l+1)$  using Littlewood's (1944) 'new multiplication' of  $S$  functions. A method of carrying out the angular momentum analysis

$$SU(2l+1) \supset O^+(2l+1) \supset O^+(3)$$

was discussed in Hamermesh (1962) and explicit results are tabulated for the cases  $l = 2$  and  $l = 3$ . Here we discuss the same angular momentum analysis by using  $S$  functions and their 'new multiplication', known as the 'plethysm operation'.

### 2. Formulation of the method

Using theorem II of Littlewood (1950) we first find the  $O^+(2l+1)$  content of an IR of  $SU(2l+1)$ . Let  $[\lambda]$  be any such IR of  $O^+(2l+1)$  contained in an IR of  $SU(2l+1)$ . We then express  $[\lambda]$  in terms of the  $S$  functions using theorem I of Littlewood (1950):

$$[\lambda] = \{\lambda\} + \sum (-1)^{p/2} g_{\gamma\eta\lambda} \{\eta\}, \tag{1}$$

summed for all  $S$  functions of the set  $\{\gamma\}$  such that  $\{\lambda\}$  appears in a product  $\{\gamma\} \{\eta\}$  with coefficient  $g_{\gamma\eta\lambda}$ , ( $\gamma$ ) being a partition of  $p$ . The  $O^+(3)$  content of each IR of  $SU(2l+1)$  appearing in the right-hand side of (1) is then found by calculating the plethysms  $\{2l\} \otimes \{\lambda\}$  and the various  $\{2l\} \otimes \{\eta\}$ . There are various methods of calculating the plethysms. Out of these we find the following formula (Littlewood 1958) as a more straightforward one, well suited to our present needs:

$$\{n\} \otimes \{\lambda\} = \prod_{i < j = 2}^{n+1} \left( \frac{p^{\lambda_i + j} - p^{\lambda_j + i}}{p^j - p^i} \right). \tag{2}$$

Taking the algebraic sum of these  $O^+(3)$  contents, coefficients being prescribed by the right-hand side of (1), we get the  $O^+(3)$  content of the IR  $[\lambda]$  of  $O^+(2l+1)$ . Though this

method is quite general in nature, actual calculations of the pethysms will become laborious when we go to higher  $l$  values. As far as we know the literature does not contain the case of  $l = 4$ . We therefore give the angular momentum analysis  $SU(9) \supset O^+(9) \supset O^+(3)$  in table 1. The modification rules required in the table are taken from Newell (1951). Dots (...) are used in the  $O^+(3)$  column against some IRs of  $O^+(9)$  to indicate that those  $O^+(3)$  contents are already specified above in the table.

**Table 1.** Angular momentum analysis  $SU(9) \supset O^+(9) \supset O^+(3)$
