Received 18 fune 1991

#### Abstract

In this paper we introduce the concept of cyclic boson algebra and study its representations. Using this algebra to realize $\mathrm{sl}_{q}(3)$, we construct the cyclic representation of the quantum universal enveloping algebra $U_{q}(s l(3)) \equiv \mathrm{si}_{q}(3)$ on the $q$-Fock space. Restricting this representation to the subalgebra $\operatorname{sl}_{q}(2)\left(\subset \operatorname{sl}_{q}(3)\right)$, we naturally obtain the irreducible cyclic representations of $81_{q}$ (2).

## 1. Introduction

Quantum group, quantum algebra ( $q$-analogue of a universal enveloping algebra) and their representation theory play a crucial role in the construction of solutions ( $R$ matrices) to the quantum Yang-Baxter equation (QYBE) [1-5]. Recently, the representations of quantum algebras at roots of unity have attracted much attention in both the mathematical field [6-8] and the physical field [9-13]. Concini and Kac, especially, have made a systematical study on the representation theory of quantum algebras in the case that $q$ is a root of unity, and Date, Jimbo, Mike and Miwa, motivated by the problems in the Potts model, have given some concrete cyclic representations studied theoretically by Concini and Kac.

The aim of this paper is to try to establish a procedure to construct explicitly the cyclic representations of a quantum algebra through the $q$-deformed boson realization [14-19]. The so-called realization theory originated from the Jordan-Schwinger mapping of Lie algebras [18] and was later generalized to associative algebras, including quantum algebras [14-17]. To get a clear picture of the realization method, let us review it. Suppose $A$ and $S$ are two associative algebras over the complex number field $\mathbb{C}$. If there exists a homomorphic mapping $\varphi: A \rightarrow S$ such that the image $\varphi(A)$ is a subalgebra of $S$, then $\varphi(A)$ is called an $S$-realization of $A$. In fact, $\varphi(A)$ defines an operator representation of $A$. As a result, a representation of $S$ naturally subduces a representation of $A \simeq \varphi(A) \subset S$. We call this subduced representation an $S$-realization of the representation of $A$. In a practical problem, $S$ is always chosen to be 'simpler' than $A$, by which we mean that it is easier to obtain the representations of $S$ than to obtain those of $A$. About this realization method there are the following three cases worth mentioning:
§ Mailing address.
(i) $A$ is a Lie algebra; $S$ is the Heisenberg-Weyl algebra generated by the creation operators and annihilation operators or the differential algebra generated by the operators $Z$ and $\mathrm{d} / \mathrm{d} Z$ on the Bargmann space [19-21]. Correspondingly, $\varphi(A)$ is called a boson realization or a differential realization.
(ii) $A$ is a quantum algebra; $S$ is the $q$-deformed boson algebra or the differential algebra. In this case, $\varphi(A)$ is called a $q$-deformed boson (or oscillator) realization and a differential realization respectively $[9,22]$.
(iii) $A$ is a quantum algebra; $S$ is an associative algebra generated by $X, Z$ and 1 satisfying $X Z=q Z X$ and $Z^{N}=X^{N}=1$. So far as we know, this realization first appears in [23], where it is used to construct cyclic representations of some quantum algebras.

In this paper, we will introduce an associative algebra called cyclic boson algebra and choose it as the above-mentioned $S$. Thus, the realization to be obtained is what we call cyclic boson realization, which, as will be seen, is the key to all our discussion. This paper is constructed as follows. In section 2 we give the definition of the cyclic boson algebra and construct its representations; in section 3, some realizations of the quantum algebra $\operatorname{sl}_{q}(3)$ and its subalgebra $\operatorname{sl}_{q}(2)$ are listed; in section 4 , the cyclic representation of $\mathrm{sl}_{q}(3)$ is constructed on the cyclic Fock space; in section 5, we discuss the representation of $\mathrm{sl}_{q}(2)$ resulting from that of $\mathrm{sl}_{q}(2)$ as a subalgebra.

## 2. Cyclic boson algebra and its representations

Let us first recall the definition of the $q$-deformed boson algebra $B_{q}$ [15-18]. As is known, it is defined as an associative algebra over $\mathbb{C}$ generated by the $q$-deformed boson operators $a_{i}^{+}, a_{i}^{-} \equiv a_{i}$ and $Q_{i}^{ \pm}=q^{ \pm N_{i}}$ satisfying the relations

$$
\begin{align*}
& a_{i} a_{j}^{+}-q^{ \pm \delta_{i j}} a_{j}^{+} a_{i}=\delta_{i j} Q_{j}^{ \pm} \quad\left[N_{i}, N_{j}\right]=0  \tag{2.1}\\
& {\left[N_{i}, a_{j}^{ \pm}\right]= \pm \delta_{i j} a_{j}^{ \pm} \quad i=1,2, \ldots, l}
\end{align*}
$$

where $q \in \mathbb{C}$. Now, we have:
Proposition 1. If $q$ is a primitive $p$ th root of unity, i.e. $q^{p}=1$, the elements $a_{i}^{ \pm p}$ and $Q_{i}^{ \pm p}(i=1,2, \ldots, l)$ belong to the centre of $B_{q}$.

Proof. The proof follows from the equations

$$
\begin{align*}
& a_{i} a_{i}^{+n}=[n] a_{i}^{n-1} Q_{i}+q^{-n} a_{i}^{+n} a_{i}  \tag{2.2}\\
& a_{i}^{ \pm} Q_{i}=q^{\mp 1} Q_{i} a_{i}^{ \pm} \quad a_{i}^{ \pm} Q_{i}^{-}=q_{i}^{ \pm 1} Q_{i}^{-} a_{i}^{ \pm}
\end{align*}
$$

where $[n]=\left(q^{n}-q^{-n}\right) /\left(q-q^{-1}\right)$. Using equation (2.1), one can easily prove them by induction.

Since $\left(a_{i}^{ \pm}\right)^{p}$ are central elements of $B_{q}$, we can restrict them to be constants without causing contradictions in the algebraic structure.

Definition 1. A cyclic boson algebra is an associative algebra generated by $a_{i}^{ \pm}$and $Q_{i}^{ \pm}$, which satisfy equation (2.1) and

$$
\begin{equation*}
\left(a_{i}^{ \pm}\right)^{p}=\xi_{i \pm} \in \mathbb{C} \tag{2.3}
\end{equation*}
$$

Having given the definition, we now turn to consider its representation. In the following we denote the cyclic boson algebra by $B_{\mathrm{c}}(l)$. Let

$$
v_{\mu}=v\left(\mu_{1}, \mu_{2}, \ldots, \mu_{i}\right) \quad\left(\mu_{i} \in \mathbb{C}, i=1,2, \ldots, l\right)
$$

be such a common eigenstate of $Q_{i}(i=1,2, \ldots, l)$ that

$$
\begin{equation*}
Q_{i} v_{\mu}=q^{\mu_{i}} v_{\mu} \tag{2.4}
\end{equation*}
$$

As a result of equation (2.4) we call it a cyclic vacuum state.
Definition 2. The cyclic Fock space $\mathscr{F}_{\mathrm{c}}(l)$ is a span of the linear-independent states

$$
\begin{aligned}
& F\left\langle m_{i}\right\rangle=F\left(m_{1}, m_{2}, \ldots, m_{l}\right) \equiv a_{1}^{+m_{1}} a_{2}^{+m_{2}} \ldots a_{l}^{+m_{l}} v_{\mu} \\
& m_{i} \in\{0,1,2, \ldots, p-1\} \quad i=1,2, \ldots, l .
\end{aligned}
$$

From the definition one can easily write down the action of $B_{c}(l)$ on $\mathscr{F}_{\mathrm{c}}(l)$

$$
\begin{align*}
& a_{j}^{+} F\left\langle m_{i}\right\rangle=F\left(m_{i}+\delta_{i j}\right\rangle \quad 0 \leqslant m_{j} \leqslant p-2 \\
& \left.\left.a_{j}^{+} F\left\langle m_{i}\right\rangle\right|_{m_{j}=p-1}=\xi_{j+} F\left\langle m_{i}\right\rangle\right\rangle_{m_{j}=0} \\
& a_{j} F\left\langle m_{i}\right\rangle=\left[m_{j}+\mu_{j}\right] F\left\langle m_{i}-\delta_{i j}\right\rangle \quad 1 \leqslant m_{j} \leqslant p-1  \tag{2.5}\\
& \left.\left.a_{j} F\left\langle m_{i}\right\rangle\right|_{m_{j}=0}=\left[\mu_{j}\right]\left(\xi_{j+}\right)^{-1} F\left\langle m_{i}\right\rangle\right\rangle_{m_{j}=p-1} \\
& Q_{j}^{ \pm} F\left\langle m_{i}\right\rangle=q^{ \pm\left(m_{j}+\mu_{j}\right)} F\left\langle m_{i}\right\rangle .
\end{align*}
$$

Proposition 2. If the parameters $\mu_{j}$ satisfy

$$
\left[\mu_{j}\right]\left[\mu_{j}+1\right]\left[\mu_{j}+2\right] \ldots\left[\mu_{j}+p-1\right]=\xi_{i+} \cdot \xi_{i-}
$$

then equation (2.5) defines a $p^{\prime}$-dimensional irreducible representation $\rho: B_{c}(l) \rightarrow$ End $\left(\mathscr{F}_{\mathrm{c}}(i)\right)$ of $B_{\mathrm{c}}(l)$.

Proof. For $l=1$, we denote $\xi_{1 \pm}, Q_{1}^{ \pm}, a_{1}^{ \pm}$and $F\left\langle m_{1}\right\rangle$ by $\xi_{ \pm}, Q^{ \pm}, a^{ \pm}$and $F(m)$ respectively. Then, we rewrite equation (2.5) as

$$
\left.\begin{array}{l}
\left\{\begin{array}{l}
a^{+} F(m)=F(m+1) \\
a^{+} F(p-1)=\xi_{+} F(0)
\end{array} \quad 0 \leqslant m \leqslant p-2\right. \\
\left\{\begin{array}{l}
a F(m)=[m+\mu] F(m-1) \\
a F(0)=[\mu]\left(\xi_{+}\right)^{-1} F(p-1)
\end{array} \quad 1 \leqslant m \leqslant p-1\right.
\end{array}\right\} \begin{aligned}
& Q^{ \pm} F(m)=q^{ \pm(m+\mu)} F(m) .
\end{aligned}
$$

It follows from (2.6b) that

$$
\begin{equation*}
a^{p} F(0)=\left(\xi_{+}\right)^{-1}[\mu][\mu+1] \ldots[\mu+p-1] F(0) \tag{2.7}
\end{equation*}
$$

On the other hand, from equation (2.3) one has

$$
\begin{equation*}
a^{p} F(0)=\xi_{-} F(0) \tag{2.8}
\end{equation*}
$$

Comparing (2.7) with (2.8), we get

$$
\begin{equation*}
\xi_{+} \cdot \xi_{-}=[\mu][\mu+1] \ldots[\mu+p-1] . \tag{2.9}
\end{equation*}
$$

For an arbitrary $l$, the proof is the same. It is easy to check that when equations ( $2.6 a-c$ ) are satisfied all the relations in (2.2) and (2.3) will be kept on the cyclic Fock space $\mathscr{F}_{\mathrm{c}}(l)$. In other words, (2.5) defines a representation of $B_{\mathrm{c}}(l)$. The dimension and irreducibility of this representation follow from (2.5) directly.

## 3. The cyclic boson realization of $\mathbf{s l}_{q}(\mathbf{3})$ and $\mathbf{S l}_{q}(\mathbf{2})$

The cyclic boson realization $\varphi\left(\mathrm{sl}_{q}(k)\right)=\left\{\hat{g}=g(g) \mid g \in \operatorname{sl}_{q}(k)\right\}$ is determined by a homomorphic mapping $\varphi: \mathrm{sl}_{q}(k) \rightarrow B_{\mathrm{c}}(l)$. In this section, we consider $\mathrm{sl}_{q}(2)$ and $\mathrm{sl}_{q}(3)$. We would like to point out that for a quantum algebra, there may exist many different realizations.

Proposition 3. For the quantum algebra $\mathrm{sl}_{q}(2)$, which is generated by $J_{ \pm}$and $K^{ \pm}=q^{ \pm J_{3}}$ satisfying

$$
\begin{equation*}
\left[J_{+} J_{-}\right]=\left[J_{3}\right] \quad\left[J_{3}, J_{ \pm}\right]= \pm 2 J_{ \pm} \tag{3.1}
\end{equation*}
$$

the following mappings define three cyclic boson realizations:
(i) $\varphi: \mathrm{sl}_{q}(2) \rightarrow B_{\mathrm{c}}(1):$

$$
\begin{equation*}
\hat{J}_{+}=a \dagger \quad \hat{J}_{-}=a[\lambda+1-N] \quad \hat{K}^{ \pm}=Q^{ \pm 2} q^{\mp \lambda} \tag{3.2}
\end{equation*}
$$

(ii) $\varphi: \mathrm{sl}_{q}(2) \rightarrow B_{\mathrm{c}}(2)$ :

$$
\begin{equation*}
\hat{J}_{+}=a_{1}^{+} a_{2} \quad \hat{J}_{-}=a_{2}^{\dagger} a_{1} \quad \hat{K}^{ \pm}=Q_{1}^{\mp 1} Q_{2}^{ \pm 2} \tag{3.3}
\end{equation*}
$$

(iii) $\varphi: \mathrm{sl}_{q}(2) \rightarrow B_{\mathrm{c}}(2)$ :

$$
\begin{equation*}
\hat{J}_{+}=a_{1}^{\dagger} \quad \hat{J}_{-}=a_{2}^{\dagger}+a_{1}\left[2 N_{2}-N_{1}+\lambda\right] \quad \hat{K}^{ \pm}=Q_{1}^{ \pm 2} Q_{2}^{\mp 2} q^{\mp \lambda} . \tag{3.4}
\end{equation*}
$$

Proof. The proof follows from the observation that $a_{i} a_{i}^{\dagger}=\left[N_{i}+1\right], a_{i}^{\dagger} a_{i}=\left[N_{i}\right]$ and $a_{i}^{ \pm} a_{j}^{ \pm}=a_{j}^{ \pm} a_{i}^{ \pm}(i \neq j)$, which is equivalent to (2.1).

For the quantum algebra $\operatorname{sl}_{q}(3)$ generated by $E_{i}, F_{i}$ and $K_{i}^{ \pm}(i=1,2)$ satisfying

$$
\begin{align*}
& {\left[E_{i}, F_{j}\right]=\delta_{i j} \frac{K_{i}-K_{i}^{-1}}{q-q^{-1}}}  \tag{3.5a}\\
& K_{i}^{ \pm} E_{j}=q^{ \pm \alpha_{i j}} E_{j} K_{i}^{ \pm} \quad K_{i}^{ \pm} F_{j}=q^{\mp \alpha_{i j}} F_{j} K_{i}^{ \pm} \\
& G_{i}^{2} G_{j}-\left(q+q^{-1}\right) G_{i} G_{j} G_{i}+G_{j} G_{i}^{2}=0  \tag{b}\\
& i \neq j \quad i, j=1,2 \quad G_{i}=E_{i} \text { or } F_{i}
\end{align*}
$$

we have the following proposition.
Proposition 4. There exists a realization of $\mathrm{sl}_{q}(3)$ determined by $\varphi: \mathrm{sl}_{q}(3) \rightarrow B_{\mathrm{c}}(3)$

$$
\begin{align*}
& \hat{E}_{1}=a_{1}^{\dagger} \\
& \hat{F}_{1}=q^{-\lambda_{1}} a_{2}^{\dagger} a_{3}-a_{1}\left[N_{1}-N_{2}+N_{3}-1-\lambda_{1}\right]  \tag{3.6a}\\
& K_{1}^{ \pm}=q^{\mp \lambda_{1}} a_{1}^{ \pm 2} Q_{2}^{\mp 1} Q_{3}^{ \pm 1} \\
& \hat{E}_{2}=a_{2}^{\dagger} Q_{1}^{-1}-q^{-1} Q_{2}^{-1} a_{1} a_{3}^{\dagger} \\
& \hat{F}_{2}=Q_{3} a_{2}\left[1+\lambda_{2}-N_{2}\right]-q^{1+\lambda_{2}} Q_{2}^{-1} a_{1}^{\dagger} a_{3}  \tag{3.6b}\\
& K_{2}^{ \pm}=q^{\mp \lambda_{2}} Q_{2}^{ \pm 2} Q_{1}^{\mp 1} Q_{3}^{ \pm 1}
\end{align*}
$$

where $\lambda_{1}$ and $\lambda_{2}$ are complex parameters.

Proof. The proof follows from direct calculation.

It is worth pointing out that on the usual Fock spaces $\mathscr{F}_{1}$

$$
\left.\left\{|m\rangle=a^{+m}|0\rangle|a| 0\right\rangle=0, Q|0\rangle=0\right\}
$$

and $\mathscr{F}_{2}$

$$
\left.\left\{\left|m_{1} m_{2}\right\rangle=a_{1}^{+m_{1}} a_{2}^{+m_{2}}|0\rangle\left|a_{1}\right| 0\right\rangle=a_{2}|0\rangle=0, Q_{1}|0\rangle=Q_{2}|0\rangle=0\right\}
$$

where $a^{ \pm}$and $a_{i}^{ \pm}(i=1,2)$ only satisfy equation (2.1), the realizations (3.2) and (3.6) define the so-called Verma representation of $\operatorname{sl}_{q}(2)$ and the Verma representation of $\mathrm{sl}_{q}(3)$ respectively.

## 4. The cyclic representation of $\mathrm{sl}_{q}(3)$

We construct the representation of $\mathrm{sl}_{q}(3)$ from the realization (3.6). The action of $\mathrm{sl}_{q}(3)$ on $\mathscr{F}_{c}(3)$ is defined by
$g \circ F\left(m_{1}, m_{2}, m_{3}\right)=\varphi(g) \circ a_{1}^{+m_{1}} a_{2}^{+m_{2}} a_{3}^{+m_{3}} v_{\mu} \quad g \in\left\{F_{i}, F_{i}, Q_{i}^{ \pm} i=1,2\right\}$.
Proposition 5. The following equations define a $p^{3}$-dimensional representation of sl $_{q}(3)$ :

$$
\begin{align*}
& E_{1} F\left(m_{1}, m_{2}, m_{3}\right)=F\left(m_{1}+1, m_{2}, m_{3}\right) \quad\left(m_{1} \neq p-1\right) \\
& E_{1} F\left(p-1, m_{2}, m_{3}\right)=\xi_{1+} F\left(0, m_{2}, m_{3}\right) \\
& \begin{aligned}
F_{1} F\left(m_{1}, m_{2},\right. & \left.m_{3}\right) \\
= & q^{-\lambda_{1}}\left[m_{3}+\mu_{3}\right] F\left(m_{1}, m_{2}+1, m_{3}-1\right) \\
& \quad-\left[m_{1}+\mu_{1}\right]\left[\left(m_{1}+\mu_{1}\right)-\left(m_{2}+\mu_{2}\right)+\left(m_{3}+\mu_{3}\right)-1-\lambda_{1}\right] F\left(m_{1}-1, m_{2}, m_{3}\right) \\
& \left(m_{1} \neq 0, m_{2} \neq p-1, m_{3} \neq 0\right)
\end{aligned} \\
& \begin{aligned}
& F_{1} F\left(m_{1}, p-1, m_{3}\right) \\
&= q^{-\lambda}\left[m_{3}+\mu_{3}\right] \xi_{2} F\left(m_{1}, 0, m_{3}-1\right) \\
& \quad-\left[m_{1}+\mu_{1}\right]\left[m_{1}+m_{3}+\mu_{1}+\mu_{3}-\lambda_{1}\right] F\left(m_{1}-1, p-1, m_{3}\right) \\
& F_{1} F\left(0, m_{2},\right.\left.m_{3}\right) \\
&= q^{-\lambda_{1}}\left[m_{3}+\mu_{3}\right] F\left(0, m_{2}+1, m_{3}-1\right) \\
&-\frac{\left[\mu_{1}\right]}{\xi_{1}+}\left[\mu_{1}-\left(m_{2}+\mu_{2}\right)+\left(m_{3}+\mu_{3}\right)-1-\lambda_{1}\right] F\left(p-1, m_{2}, m_{3}\right) \\
&= q^{-\lambda_{1}} \frac{\left[\mu_{3}\right]}{\xi_{3}+} F\left(m_{1}, m_{2}+1, p-1\right) \\
& \quad\left[m_{1}+\mu_{1}\right]\left[m_{1}+\mu_{1}-\left(m_{2}+\mu_{2}\right)+\mu_{3}-1-\lambda_{1}\right] F\left(m_{1}-1, m_{2}, 0\right) \\
& F_{1} F\left(m_{1}, m_{2}, 0\right)
\end{aligned} \\
& K_{1}^{ \pm} F\left(m_{1}, m_{2}, m_{3}\right)=q^{ \pm\left(2\left(m_{1}+\mu_{1}\right)-\left(m_{2}+\mu_{2}\right)+\left(m_{3}+\mu_{3}\right)-\lambda_{1}\right) F\left(m_{1}, m_{2}, m_{3}\right) .}
\end{align*}
$$

$$
\begin{align*}
& E_{2} F\left(m_{1}, m_{2},\right.\left.m_{3}\right) \\
&= q^{-\left(m_{1}+\mu_{1}\right)} F\left(m_{1}, m_{2}+1, m_{3}\right)-q^{-\left(m_{2}+\mu_{2}\right)-1}\left[m_{1}+\mu_{1}\right] F\left(m_{1}-1, m_{2}, m_{3}+1\right) \\
&\left(m_{1} \neq 0, m_{2} \neq p-1, m_{3} \neq p-1\right) \\
& E_{2} F\left(0, m_{2}, m_{3}\right)=q^{-\mu_{1}} F\left(0, m_{2}+1, m_{3}\right)-\frac{\left[\mu_{1}\right]}{\xi_{1}+} q^{-\left(m_{2}+\mu_{2}+1\right)} F\left(p-1, m_{2}, m_{3}+1\right) \\
& E_{2} F\left(m_{1}, p-1, m_{3}\right)=q^{-\left(m_{1}+\mu_{1}\right)} \xi_{2+} F\left(m_{1}, 0, m_{3}\right)-q^{-\mu_{2}}\left[m_{1}+\mu_{1}\right] F\left(m_{1}-1, p-1, m_{3}+1\right) \\
& E_{2} F\left(m_{1}, m_{2}, p-1\right) \\
&= q^{-\left(m_{1}+\mu_{1}\right)} F\left(m_{1}, m_{2}+1, p-1\right)-q^{-\left(m_{2}+\mu_{2}+1\right)}\left[m_{1}+\mu_{1}\right] \xi_{3+} F\left(m_{1}-1, m_{2}, 0\right) \\
& F_{2} F\left(m_{1}, m_{2},\right.\left.m_{3}\right) \\
&= q^{m_{3}+\mu_{3}}\left[1+\lambda_{2}-\left(m_{2}+\mu_{2}\right)\right]\left[m_{2}+\mu_{2}\right] F\left(m_{1}, m_{2}-1, m_{3}\right) \\
& \quad-q^{1+\lambda_{2}-\left(m_{2}+\mu_{2}\right)}\left[m_{3}+\mu_{3}\right] F\left(m_{1}+1, m_{2}, m_{3}-1\right) \\
&\left(m_{2} \neq 0, m_{1} \neq p-1, m_{3} \neq 0\right)  \tag{4.1b}\\
& F_{2} F(p-1, m_{2}, \\
&=\left.m_{3}\right) \\
&= q^{m_{3}+\mu_{3}}\left[1+\lambda_{2}-\left(m_{2}+\mu_{2}\right)\right]\left[m_{2}+\mu_{2}\right] F\left(p-1, m_{2}-1, m_{3}\right) \\
& \quad-q^{1+\lambda_{2}-\left(m_{2}+\mu_{2}\right)}\left[m_{3}+\mu_{3}\right] \xi_{1+} F\left(0, m_{2}, m_{3}-1\right) \\
& F_{2} F\left(m_{1}, 0,\right.\left.m_{3}\right) \\
&= q^{m_{3}+\mu_{3}}\left[1+\lambda_{2}-\left(m_{2}+\mu_{2}\right)\right] \frac{\left[\mu_{2}\right]}{\xi_{2}+} F\left(m_{1}, p-1, m_{3}\right) \\
& \quad-q^{1+\lambda_{2}-\mu_{2}\left[m_{3}+\mu_{3}\right] F\left(m_{1}+1,0, m_{3}-1\right)} \\
& K_{2}^{ \pm} F\left(m_{1}, m_{2},\right.\left.m_{3}\right)=q^{ \pm\left(2\left(m_{2}+\mu_{2}\right)-\left(m_{1}+\mu_{1}\right)+\left(m_{3}+\mu_{3}\right)-\lambda_{2}\right)} F\left(m_{1}, m_{2}, m_{3}\right) .
\end{align*}
$$

Proof. It is proved through lengthy but straightforward calculation.
Remark 1. When $\mu_{i}, \xi_{i+} \neq 0(i=1,2)$, the representation (4.1) has neither the lowest nor the highest weight, and $E_{i}^{p}$ and $F_{i}^{p}$ are non-zero constants in this representation. So it is an irreducible cyclic representation. In fact, according to Kac and Concini, the dimension $D$ of an irreducible representation of a quantum algebra $G_{q}$ satisfies

$$
\begin{equation*}
D \leqslant p^{m} \quad m=(\operatorname{dim} G-\operatorname{rank} G) / 2 \tag{4.2}
\end{equation*}
$$

where $\operatorname{dim} G$ and rank $G$ are respectively the dimension and the rank of the Lie algebra $G$ corresponding to the quantum algebra. For $\mathrm{sl}_{q}(3)$, $\operatorname{dim} G=8$, rank $=2$ and $m=3$. Thus, the representation (4.1) is an irreducible cyclic representation with the maximum dimension.

Remark 2. If $\left[\mu_{i}\right]=0(i=1,2),(4.1)$ determines a representation with the lowest weight, which can be obtained on the cyclic Verma module

$$
\left\{f\left(m_{1}, m_{2}, m_{3}\right)=E_{1}^{m_{1}} E_{2}^{m_{2}} E_{3}^{m_{3}} v_{\lambda} \mid m_{1}, m_{2}, m_{3} \in \mathbb{Z}^{+}\right\}
$$

where $\quad E_{i}^{p}=\xi_{i+} \quad(i=1,2,3), \quad F_{1} v_{\lambda}=f_{2} v_{\lambda}=0, \quad K_{i}^{ \pm} v_{\lambda}=q^{\mp \lambda_{i}} v_{\lambda} \quad(i=1,2) \quad$ and $\quad E_{3}=$ $E_{1} E_{2}-q E_{2} E_{1}$ is the generator corresponding to the third root of Lie algebra $A_{2}$.

## 5. The boson representation of $\operatorname{sl}_{q}(\mathbf{2})$

Since $\mathrm{sl}_{q}(2)$ is a subalgebra of $\mathrm{sl}_{q}(3)$, the restriction of the representation (4.1) to it naturally defines a representation of it. This representation is given by (4.1a). According to Concini and Kac (see equation (4.2)), this $p^{3}$-dimensional representation of $\mathrm{sl}_{q}(2)$ is reducible. We are trying to find an irreducible cyclic representation from it.

In (4.1a), we let $\mu_{i}=0(i=2,3)$. Then we obtain the representation of $s l_{q}(2)$ :

$$
\begin{align*}
& E_{1} F\left(m_{1}, m_{2}, m_{3}\right)=F\left(m_{1}+1, m_{2}, m_{3}\right) \quad\left(m_{1} \neq p-1\right) \\
& \begin{array}{c}
E_{1} F\left(p-1, m_{2}, m_{3}\right)=\xi_{1+} F\left(0, m_{2}, m_{3}\right) \\
F_{1} F\left(m_{1}, m_{2}, m_{3}\right) \\
=q^{-\lambda}\left[m_{3}\right] F\left(m_{1}, m_{2}+1, m_{3}-1\right)-\left[m_{1}+\mu_{1}\right]\left[\left(m_{1}+\mu_{1}\right)-m_{2}+m_{3}-1-\lambda_{1}\right] \\
\quad \times F\left(m_{1}-1, m_{2}, m_{3}\right) \quad\left(m \neq 0, m_{2} \neq p-1, m_{3} \neq 0\right)
\end{array} \\
& \begin{array}{c}
F_{1} F\left(m_{1}, p-1, m_{3}\right)=-\left[m_{1}+\mu_{1}\right]\left[m_{1}+m_{3}+\mu_{1}-\lambda_{1}\right] F\left(m_{1}-1, p-1, m_{3}\right) \\
F_{1} F\left(0, m_{2}, m_{3}\right) \\
=q^{-\lambda_{1}}\left[m_{3}\right] F\left(0, m_{2}+1, m_{3}-1\right) \\
\quad-\frac{\left[\mu_{1}\right]}{\xi_{1+}}\left[\mu_{1}-m_{2}+m_{3}-1-\lambda_{1}\right] F\left(p-1, m_{2}, m_{3}\right) \\
F_{1} F\left(m_{1}, m_{2}, 0\right)=-\left[m_{1}+\mu_{1}\right]\left[m_{1}+\mu_{1}-m_{2}-1-\lambda_{1}\right] F\left(m_{1}-1, m_{2}, 0\right] \\
K_{1}^{ \pm} F\left(m_{1}, m_{2}, m_{3}\right)=q^{ \pm\left(2\left(m_{1}+\mu_{1}\right)-m_{2}+m_{3}-\lambda_{1}\right)} F\left(m_{1}, m_{2}, m_{3}\right) .
\end{array}
\end{align*}
$$

We note that $V_{c}$

$$
\{F(m, 0,0) \equiv F(m) \mid m=0,1,2, \ldots, p-1\}
$$

is a $p$-dimensional invariant subspace for the representation defined by (5.1), so we have:

Proposition 6. On the space $V_{\mathrm{c}}$, the representation (5.1) subduces an irreducible cyclic representation of $\mathrm{sl}_{q}(2)$

$$
\begin{aligned}
& E_{1} F(m)=F(m+1) \quad(m \neq p-1) \\
& E_{1} F(p-1)=\xi_{1} F(0) \\
& F_{1} F(m)=\left[m+\mu_{1}\right]\left[1+\lambda_{1}-\left(m+\mu_{1}\right)\right] \cdot F(m-1) \quad(m \neq 0) \\
& F_{1} F(0)=\left[\lambda_{1}+1-\mu_{1}\right] \cdot \frac{\left[\mu_{1}\right]}{\xi_{1+}} F(p-1) \\
& K_{1}^{ \pm} F(m)=q^{ \pm\left(2\left(m+\mu_{1}\right)-\lambda_{1}\right)} F(m)
\end{aligned}
$$

Remark. When $\mu=0$, this representation can be directly obtained on the cyclic Verma module

$$
\left\{f(m)=E_{1}^{m} v_{\lambda_{1}} \mid m \in \mathbb{Z}^{+}\right\}
$$

where $E_{1}^{p}=\xi_{1+}, F_{1} v_{\lambda_{1}}=0$ and $K_{1}^{ \pm} v_{\lambda_{1}}=q^{\mp \lambda_{1}} v_{\lambda_{1}}$.

## 6. Short discussion

We have seen that the $q$-deformed boson realization is indeed a powerful method of constructing representations of a quantum algebra. In fact, not only can it greatly simplify the calculation made to obtain the explicit representations of a quantum algebra, but it can also stimulate one's imagination: the fact that the special cyclic boson (with $\xi_{i \pm}=0$ and $p=2$ ) satisfies $a_{i}^{ \pm 2}=0$ may lead one to make a guess at the relation between a general cyclic boson and an anyon. Finally we point out that the method discussed in this paper can be generalized to other quantum algebras in a straightforward way.
