Reinvestigation of the Structure of K₂FeF₅

A. LE BAIL, A. DESERT,* AND J. L. FOURQUET

Laboratoire des Fluorures UA CNRS 449, and *Laboratoire de Physique de l'Etat Condensé, UA CNRS 807, Faculté des Sciences, Université du Maine, Route de Laval, 72017 Le Mans Cedex, France

Received July 21, 1989; in revised form October 16, 1989

The structure of K₂FeF₅ is reinvestigated: space group *Pbcn*, Z = 16, a = 7.4059(4), b = 12.8771(9), c = 20.4282(13) Å (previous proposition: S.G. *Pn*₂₁*a* with *c*, *a*, *b* permutation). R = 0.036 ($R_w = 0.040$) for 1663 reflections and 149 parameters. All essential features of the previous description are maintained. © 1990 Academic Press, Inc.

1. Introduction

During a recent investigation of the thermal dehydration of $(NH_4)_2FeF_5 \cdot H_2O$, two phases were evidenced (1): $\beta \cdot (NH_4)_2FeF_5$ which is isostructural with $(NH_4)_2MnF_5$ (2) and $\alpha \cdot (NH_4)_2FeF_5$ which exhibits a new structural type. The structure resolution of the α phase was realized by X-ray powder diffraction technique; strong structural correlations with the K₂FeF₅-type were observed. If $\alpha \cdot (NH_4)_2FeF_5$ crystallizes in the centrosymmetric space group *Pbcn* (unambiguously), then some doubt arises about the description of K₂FeF₅ in the noncentrosymmetric space group *Pn2*₁*a* (3). Therefore, the structure was reinvestigated.

2. Experimental

Single crystals were prepared in a platinum crucible by the horizontal Bridgman method, from a mixture of 0.495 KF + 0.505 FeF₃. They were obtained together with KFeF₄ crystals from which they can be easily separated.

A colorless transparent crystal was selected. Data were collected on an AED2 Siemens-Stoe four circles diffractometer.

The systematic extinctions were not consistent with the previously retained space group $Pn2_1a$ (or Pnma) but with the nonequivocally centrosymmetric Pbcn space group, when an appropriate parameters permutation was performed. The experimental details of the data collection are given in Table I. Refinements were performed using the SHELX-76 program (4). Ionic scattering factors and anomalous dispersion terms were taken from *International Tables for X-ray Crystallography* (5). The refinements converge rapidly to R =0.059 in the isotropic approximation (65 parameters) and R = 0.036 ($R_w = 0.040$)¹ with

3. Results and Discussion

As shown in Fig. 1, all essential features of the previous structural description are maintained. The coordinates and anisotropic thermal parameters are given in Table II, selected interatomic distances and angles in Table III. Some understandable anomalies appearing in the previous study (Fe-F and K-F distances as short as 1.804 and 2.539 Å, respectively) are rectified. The usual shortening of the four Fe-F terminal bonds is confirmed. The K⁺ coordinations were given as being 9 and 10. In fact, we observe a clear cut of the K-F distances near 3.25 Å, the next nearest F neighbors being at 3.5 Å, so the K⁺ coordinations are 11 (K2, K4), 10 (K3, K5), and 9 (K1). However, K1 could be considered as eightfold coordinated because the 9th F is clearly at a very much longer distance than the others (0.35 Å more).

In the A_2BF_5 -type compounds, three are

TABLE III Interatomic Distances (Å) and Angles (°) for K_2FeF_5

FIG. 3. Projection of the α -(NH₄)₂FeF₅ structure on the (100) plane.

now known to be made up with octahedral zig-zag *cis* chains: K_2FeF_5 , Rb_2CrF_5 (6) (Fig. 2), and α -(NH₄)₂FeF₅ (1) (Fig. 3). These three structural types provide an in-

teresting series for the intercomparison of one-dimensional magnetic behavior.

4. Acknowledgments

One of the authors (A.D.) would like to thank Professor J. Nouet and G. Niesseron for providing her with single crystals of K_2FeF_5 .
