Six quaternary rubidium selenides  $\text{RbLn}_2\text{CuSe}_4$  ( $\text{Ln} = \text{Sm, Gd, Dy}$ ),  $\text{Rb}_{1.5}\text{Ln}_2\text{Cu}_{2.5}\text{Se}_5$  ( $\text{Ln} = \text{Gd, Dy}$ ), and  $\text{RbSm}_2\text{Ag}_3\text{Se}_5$  have been synthesized at 1073 K with the use of a reactive flux of  $\text{Rb}_2\text{Se}_3$ . At 153 K all compounds contain four formula units in orthorhombic unit cells. The isostructural compounds  $\text{RbLn}_2\text{CuSe}_4$  crystallize in space group *Cmcm*; the isostructural compounds  $\text{Rb}_{1.5}\text{Ln}_2\text{Cu}_{2.5}\text{Se}_5$  crystallize in space group *Pnmm*;  $\text{RbSm}_2\text{Ag}_3\text{Se}_5$  crystallizes in space group *Cmcm*. The cells of  $\text{RbLn}_2\text{CuSe}_4$  are ( $\text{Ln}$ ,  $a$ ,  $b$ ,  $c$  (Å)): Sm, 4.1834(9), 14.308(3), 14.439(3); Gd, 4.1568(8), 14.227(3), 14.409(3); Dy, 4.1237(10), 14.083(4), 14.291(3), and the corresponding  $R_1$  indices for the refined structures are 0.023, 0.029, and 0.039. The cells of  $\text{Rb}_{1.5}\text{Ln}_2\text{Cu}_{2.5}\text{Se}_5$  are: Gd, 16.243(3), 16.449(3), 4.0980(7); Dy, 16.120(3), 16.292(3), 4.0610(8), and the  $R_1$  indices are 0.036 and 0.043. The cell of  $\text{RbSm}_2\text{Ag}_3\text{Se}_5$  is 4.3223(6), 15.229(2), 17.420(3) Å and the  $R_1$  index is 0.025. All six are closely related three-dimensional tunnel structures. Their anionic frameworks are built from  $\text{LnSe}_6$  octahedra and  $\text{MSe}_4$  ( $M = \text{Cu, Ag}$ ) tetrahedra.  $\text{RbLn}_2\text{CuSe}_4$  contains infinite  $^1_\infty[\text{CuSe}_3]$  chains of vertex-sharing tetrahedra;  $\text{Rb}_{1.5}\text{Ln}_2\text{Cu}_{2.5}\text{Se}_5$  also contains infinite chains of tetrahedra; and the tunnel in  $\text{RbSm}_2\text{Ag}_3\text{Se}_5$  holds one  $\text{Rb}^+$  cation in a 10-membered ring consisting of six Ag–Se bonds and four Sm–Se bonds.  $\text{Rb}_{1.5}\text{Dy}_2\text{Cu}_{2.5}\text{Se}_5$ , which is paramagnetic, obeys the Curie–Weiss law and has an effective magnetic moment of 10.63(4)  $\mu_B$ . © 2000 Academic Press

## INTRODUCTION

Quaternary lanthanides and actinides that contain a  $d$ -block metal in addition to the  $f$ -block metal are of interest because intriguing structural and physical properties may result from the interplay of covalent transition-metal and the more ionic lanthanide and actinide bonding. The high- $T_c$  cuprate superconductors provide a spectacular example. Recently, a number of  $A/\text{Ln}/M/Q$  ( $A = \text{alkali or earth-alkaline metal}$ ;  $\text{Ln} = f\text{-block element, usually a rare earth}$ ;  $M = d\text{-block element}$ ;  $Q = \text{chalcogen} = \text{S, Se, Te}$ ) systems have been synthesized. These include  $\text{CsUTiTe}_5$  (1),

$\text{BaLnMQ}_3$  ( $\text{Ln} = \text{rare-earth}$ ;  $M = \text{Cu, Ag, Au}$ ;  $Q = \text{S, Se, Te}$ ) (2–5),  $\text{Ba}_2\text{LnAg}_5\text{S}_6$  ( $\text{Ln} = \text{La, Y}$ ) (6),  $\text{K}_{1.5}\text{Dy}_2\text{Cu}_{2.5}\text{Te}_5$  (5),  $\text{K}_{0.5}\text{Ba}_{0.5}\text{DyCu}_{1.5}\text{Te}_3$  (5),  $\text{KGd}_2\text{CuS}_4$  (7),  $\text{K}_2\text{CeCu}_2\text{S}_4$  (8),  $\text{ALnCu}_2\text{S}_6$  ( $A = \text{K, Cs}$ ;  $\text{Ln} = \text{La, Ce, Eu}$ ) (8–10),  $\text{ALnCuQ}_3$  ( $A = \text{K, Cs}$ ;  $\text{Ln} = \text{Ce, U}$ ;  $Q = \text{S, Se, Te}$ ) (1, 10),  $\text{K}_2\text{CeAg}_3\text{Te}_4$  (11),  $\text{KCeCuTe}_4$  (12), and  $\text{Rb}_2\text{CeCu}_3\text{Te}_5$  (13). These compounds crystallize in a variety of structure types that include two-dimensional layered structures and three-dimensional tunnel structures. The  $M$  atoms (except Ti) are tetrahedrally coordinated by chalcogen atoms. These tetrahedra enter into chains, layers, and other frameworks. Here we report the synthesis and structural characterization of six new compounds containing  $f$ - and  $d$ -block metals, namely the quaternary rubidium selenides  $\text{RbLn}_2\text{CuSe}_4$  ( $\text{Ln} = \text{Sm, Gd, Dy}$ ),  $\text{Rb}_{1.5}\text{Ln}_2\text{Cu}_{2.5}\text{Se}_5$  ( $\text{Ln} = \text{Gd, Dy}$ ), and  $\text{RbSm}_2\text{Ag}_3\text{Se}_5$ .

## EXPERIMENTAL

### Syntheses

The following reagents were used as obtained: Rb (Aldrich, 98 + %), Sm (Alfa, 99.9%), Gd (Alfa, 99.9%), Dy (Aldrich, 99.9%), Cu (Aldrich, 99.999%), Ag (Alfa, 99.99%), Se (Aldrich, 99.5%).  $\text{Rb}_2\text{Se}_3$ , the reactive flux (14) employed in the syntheses, was prepared by the stoichiometric reaction of the elements in liquid  $\text{NH}_3$ . The reaction mixtures were ( $\text{Rb}_2\text{Se}_3$ ,  $\text{Ln}$ , Cu or Ag, Se in mmol):  $\text{RbLn}_2\text{CuSe}_4$  (1.2, 1.0, 0.5, 2.0);  $\text{Rb}_{1.5}\text{Ln}_2\text{Cu}_{2.5}\text{Se}_5$  (1.2, 1.0, 1.0, 2.0);  $\text{RbSm}_2\text{Ag}_3\text{Se}_5$  (1.2, 1.0, 1.0, 3.0). These mixtures were loaded into fused-silica tubes under an Ar atmosphere in a glove box. These tubes were sealed under a  $10^{-4}$  Torr atmosphere and then placed in a computer-controlled furnace. The samples were heated to 1073 K in 15 h, kept at 1073 K for 30 h, and then cooled to 298 K in 10 h. Major products in all instances were red needles of the desired materials. Yields varied from 70 to 90%. Selected single crystals were examined with an EDX-equipped Hitachi S-4500 SEM and were found to have the stated compositions within the accuracy

of the method ( $\pm 5\%$ ). All these compounds are modestly stable in air.

### Crystallography

Single-crystal X-ray diffraction data were obtained with the use of graphite-monochromatized MoK $\alpha$  radiation ( $\lambda = 0.71073$  Å) at 153 K on a Bruker Smart-1000 CCD diffractometer (15). Intensity data were collected with the program SMART (15). Cell refinement and data reduction were carried out with the use of the program SAINT (15) and face-indexed absorption corrections were carried out numerically with the program XPREP (16). Then the program SADABS (15) was employed to make incident beam and decay corrections.

The structures were solved with the direct methods program SHELXS and refined with the full-matrix least-squares program SHELXL of the SHELXTL-PC suite of programs (16). Each final refinement included anisotropic displacement parameters. A secondary extinction correction was included for all but Rb<sub>1.5</sub>Gd<sub>2</sub>Cu<sub>2.5</sub>Se<sub>5</sub>.

Refinements of the structures of RbLn<sub>2</sub>CuSe<sub>4</sub> (Ln = Sm, Gd, Dy) and RbSm<sub>2</sub>Ag<sub>3</sub>Se<sub>5</sub> were straightforward, whereas those of the structures of Rb<sub>1.5</sub>Ln<sub>2</sub>Cu<sub>2.5</sub>Se<sub>5</sub> (Ln = Gd, Dy) were not. In these latter isostructural compounds there are three crystallographically independent Cu sites. Initial isotropic refinements resulted in displacement parameters of the Cu3 atoms that were much larger than those for atoms Cu2 and Cu1. Accordingly, the occupancies of all three Cu sites were varied in a refinement that involved anisotropic displacement parameters. The resultant occupancies of Cu1, Cu2, and Cu3 in the Dy compound were 1.000(8), 0.862(8),

and 0.650(9), and in the Gd compound they were 0.992(7), 0.935(7), and 0.559(7). In the final refinements the occupancy of Cu1 was fixed at 1.0 in both structures and the occupancies of Cu2 and Cu3 were varied. The resultant compositions are Rb<sub>1.5</sub>Gd<sub>2</sub>Cu<sub>2.496(5)</sub>Se<sub>5</sub> and Rb<sub>1.5</sub>Dy<sub>2</sub>Cu<sub>2.512(6)</sub>

<sup>a</sup> The *x* coordinate of all atoms is 0.

<sup>b</sup>  $U_{eq}$  is defined as one third of the trace of the orthogonalized  $U_{ij}$  tensor.

Se<sub>5</sub>. As there are no close Se...Se interactions the oxidation states of +1, +3, +1, and -2 for Rb, Ln, Cu, and Se, respectively, may be assigned and charge balance is achieved. Additional crystallographic details are given in Table 1. Tables 2, 3, and 4 give positional parameters and equivalent isotropic displacement parameters, and Tables 5, 6, and 7 present selected bond distances for RbLn<sub>2</sub>CuSe<sub>4</sub> (Ln = Sm, Gd, Dy), Rb<sub>1.5</sub>Ln<sub>2</sub>Cu<sub>2.5</sub>Se<sub>5</sub> (Ln = Gd, Dy), and RbSm<sub>2</sub>Ag<sub>3</sub>Se<sub>5</sub>, respectively.

### Magnetic Susceptibility

A 24-mg sample of Rb<sub>1.5</sub>Dy<sub>2</sub>Cu<sub>2.5</sub>Se<sub>5</sub> containing single crystals was used for magnetic susceptibility measurements. Composition of the sample was verified by EDX measurements. The magnetization was measured at 200 G between 5 and 300 K with the use of a Quantum Design SQUID magnetometer. All measurements were corrected for core diamagnetism (17).

## RESULTS AND DISCUSSION

The structure of the compounds RbLn<sub>2</sub>CuSe<sub>4</sub> (Ln = Sm, Gd, Dy) (Fig. 1) is isostructural to KGd<sub>2</sub>CuS<sub>4</sub> (7). The

<sup>a</sup>The x coordinate of all atoms is 0.

structure has a three-dimensional tunnel framework. The tunnel, comprising 10-membered rings of four Cu–Se bonds and six Ln–Se bonds, is only large enough in cross section to accommodate one Rb<sup>+</sup> cation. The anionic [Ln<sub>2</sub>CuSe<sub>4</sub><sup>-</sup>] framework is built up from LnSe<sub>6</sub> octahedra and CuSe<sub>4</sub> tetrahedra. As shown in Fig. 2, there are one-dimensional vertex-sharing CuSe<sub>4</sub> tetrahedra running along the [100] direction. This one-dimensional chain can also be found in the KZrCuS<sub>3</sub> structure type (18), for example in BaDyCuTe<sub>3</sub> (5) (Fig. 3). But BaDyCuTe<sub>3</sub> is a layered structure that contains <sup>2</sup>/<sub>∞</sub>[DyCuTe<sub>3</sub><sup>2-</sup>] layers separated by Ba<sup>2+</sup> cations. The <sup>2</sup>/<sub>∞</sub>[DyCuTe<sub>3</sub><sup>2-</sup>] layer is built up from DyTe<sub>7</sub> monocapped trigonal prisms and CuTe<sub>4</sub> tetrahedra alternating along the [100] direction. If the Se3 atom in RbLn<sub>2</sub>CuSe<sub>4</sub> were broken into two atoms, then the structure would be made up of zigzag <sup>2</sup>/<sub>∞</sub>[Ln<sub>2</sub>CuSe<sub>3</sub><sup>3-</sup>] layers comprising two edge-sharing LnSe<sub>6</sub> octahedra and one CuSe<sub>4</sub> tetrahedron in turn along the [001] direction in Fig. 1. Some rules for the edge-sharing of octahedra and tetrahedra to form a two-dimensional layer have been described in the investigation of the A/M/Cu/Q (A = Na, K, Cs, Tl; M = Ti, Zr; Q = S, Se, Te) system (19).

The structure of Rb<sub>1.5</sub>Ln<sub>2</sub>Cu<sub>2.5</sub>Se<sub>5</sub> (Ln = Gd, Dy), illustrated in Fig. 4, is also a three-dimensional tunnel structure.

Ln2-Se4 × 2	2.9986(11)	2.9665(12)
Ln2-Se5	3.0555(15)	3.0180(17)
Cu1-Se1	2.484(2)	2.468(2)
Cu1-Se2 × 2	2.5286(13)	2.5074(14)
Cu1-Se3	2.464(2)	2.453(2)
Cu2-Se4 × 2	2.4903(14)	2.4613(16)
Cu2-Se5	2.410(2)	2.412(3)
Cu2-Se5	2.896(3)	2.942(3)
Cu3-Se4	2.396(4)	2.398(4)
Cu3-Se5 × 2	2.4189(19)	2.413(2)

Its structure is similar to that of  $\text{K}_{1.5}\text{Dy}_2\text{Cu}_2.5\text{Te}_5$ , but only three of the four tetrahedral Cu sites in  $\text{K}_{1.5}\text{Dy}_2\text{Cu}_2.5\text{Te}_5$  (5) are occupied in the present structure. In one tunnel three  $\text{Rb}^+$  cations are placed in a 20-membered ring composed of four Cu-Se bonds and 16 Ln-Se bonds. The three-dimensional anionic framework is also built from  $\text{LnSe}_6$  octahedra and  $\text{CuSe}_4$  tetrahedra. Infinite chains of vertex-sharing  $\text{CuSe}_4$  tetrahedra (Cu1) are found again running along the [001] direction (see Figs. 4 and 2). Infinite double chains made up from these infinite chains by edge-sharing run in the [001] direction, as shown in Fig. 5a. Such double chains have been found not only in  $\text{K}_{1.5}\text{Dy}_2\text{Cu}_2.5\text{Te}_5$  (5) but also in layered compounds  $\text{Na}M\text{Cu}Q_3$  ( $M = \text{Ti, Zr}; Q = \text{S, Se, Te}$ ) (20),  $\text{TiTiCuTe}_3$  (21), and  $\text{Na}_2\text{ZrCu}_2\text{Se}_4$  (22). The  $\text{CuSe}_4$  tetrahedra in these chains are distorted with Cu2-Se4 (× 2), Cu2-Se5, and Cu2-Se5 distances of 2.4613(16), 2.412(3), and

**TABLE 7**  
Selected Bond Distances (Å) for  $\text{RbSm}_2\text{Ag}_3\text{Se}_5$

Rb-Se1 × 4	3.6853(7)	Sm-Se3 × 2	2.9616(5)
Rb-Se2 × 2	3.4777(11)	Ag1-Se1 × 2	2.6966(8)
Rb-Se3 × 2	3.5773(9)	Ag1-Se2 × 2	2.6225(7)
Sm-Se1 × 2	2.9289(5)	Ag2-Se1	2.6792(8)
Sm-Se2	2.8758(6)	Ag2-Se1	2.7693(8)
Sm-Se3	2.9120(8)	Ag2-Se3 × 2	2.6572(5)

**FIG. 1.** The unit cell of  $\text{RbLn}_2\text{CuSe}_4$  viewed down in [100].

2.942(3) Å for  $\text{Rb}_{1.5}\text{Dy}_2\text{Cu}_2.5\text{Se}_5$ , as an example. Another potential tetrahedral site in the chain in Fig. 5b, which is partially occupied by a Cu atom in  $\text{K}_{1.5}\text{Dy}_2\text{Cu}_2.5\text{Te}_5$ , is distorted into a triangular site (one Se4, two Se5) about a Cu3 atom. In  $\text{Rb}_{1.5}\text{Ln}_2\text{Cu}_2.5\text{Se}_5$  the Cu-Cu distances may range from 2.477(7) to 2.809(3) Å, but need not since the Cu2 and Cu3 sites are partially occupied. However, such  $\text{Cu}^+(d^{10})\text{-Cu}^+(d^{10})$  interactions have been described elsewhere (5, 23-26).

$\text{RbSm}_2\text{Ag}_3\text{Se}_5$  is also a three-dimensional tunnel structure, as shown in Fig. 6. The tunnel is very similar to that in  $\text{RbLn}_2\text{CuSe}_4$  and holds one  $\text{Rb}^+$  cation in a 10-membered ring consisting of six Ag-Se bonds and four Sm-Se bonds. The framework is related to that in  $\text{RbLn}_2\text{CuSe}_4$ , being built from  $\text{LnSe}_6$  octahedra and  $\text{AgSe}_4$  tetrahedra. Figure 7 shows some of the single chains and double chains that share vertices in  $\text{RbSm}_2\text{Ag}_3\text{Se}_5$ .

Selected bond distances for these six compounds are listed in Tables 5, 6, and 7. The  $\text{Rb}^+$  cations are coordinated to bicapped trigonal prisms of eight Se atoms in these

structures, with Rb-Se distance ranging from 3.266(3) to 3.9347(8) Å, consistent with those in Rb<sub>2</sub>Se<sub>5</sub> (3.36(2)–3.74(2) Å) (27). Ln-Se distances are unexceptional and decrease from Sm to Gd to Dy, as is expected given the lanthanide contraction.

A plot of 1/χ vs T is shown in Fig. 8 for Rb<sub>1.5</sub>Dy<sub>2</sub>Cu<sub>2.5</sub>Se<sub>5</sub>. This material is paramagnetic in the 5–300 K range. The susceptibility data were fit by a least-squares

method to the Curie-Weiss equation  $\chi = C/(T - \theta)$ , where  $C$  is the Curie constant and  $\theta$  is the Weiss constant. The resulting values for  $C$  and  $\theta$  are  $14.10(5) \text{ emuKmol}^{-1}$  and  $-11.23(7) \text{ K}$ , respectively. The calculated effective magnetic moment of  $10.63(4) \mu_B$  agrees well with the theoretical value of  $10.65 \mu_B$  for  $\text{Dy}^{3+}$  (28).

FIG. 8. Plot of the molar susceptibility  $1/\chi$  vs  $T$  for  $\text{Rb}_{1.5}\text{Dy}_2\text{Cu}_{2.5}\text{Se}_5$ , where the solid line is the least-squares fit.
