#### Abstract

Eight quaternary rare-earth chalcogenides, $\mathbf{R b N d}_{2} \mathbf{C u S}_{4}$, $\mathrm{RbSm}_{2} \mathrm{CuS}_{4}, \quad \mathrm{CsLa}_{2} \mathrm{CuSe}_{4}, \quad \mathrm{CsSm}_{2} \mathrm{CuSe}_{4}, \quad \mathrm{RbEr}_{2} \mathrm{Cu}_{3} \mathrm{~S}_{5}$, $\mathrm{CsGd}_{2} \mathrm{Ag}_{3} \mathrm{Se}_{5}, \mathrm{CsTb}_{2} \mathrm{Ag}_{3} \mathrm{Se}_{5}$, and $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$, have been synthesized at 973 K with the use of a reactive flux of $A_{2} Q_{3}$ ( $A=\mathrm{Rb}, \mathrm{Cs} ; Q=\mathrm{S}, \mathrm{Se}$ ). All structural data were obtained at 153 K . The isostructural compounds $A L n_{2} \mathrm{Cu} Q_{4}$ ( $L n=$ rare earth) crystallize with four formula units in the $\mathbf{K G d}_{2} \mathbf{C u S}_{4}$ structure type in space group Cmcm of the orthorhombic system; the isostructural compounds $\mathrm{ALn}_{2} \mathrm{M}_{3} Q_{5}(\mathrm{M}=\mathrm{Cu}, \mathrm{Ag})$ crystallize with four formula units in the $\mathrm{RbSm}_{2} \mathrm{Ag}_{3} \mathrm{Se}_{5}$ structure type in space group Cmcm of the orthorhombic system; and $\mathbf{R b}_{\mathbf{2}} \mathbf{G d}_{4} \mathbf{C u}_{4} \mathbf{S}_{\mathbf{9}}$ crystallizes with two formula units in space group $C 2 / m$ of the monoclinic system. The cell dimensions of $\operatorname{ALn}_{2} \mathrm{Cu} Q_{4}(a, b, c$ $(\AA))$ are as follows: $\mathrm{RbNd}_{2} \mathrm{CuS}_{4}, 4.0762(3)$, 13.954(1), 13.964(1); $\mathrm{RbSm}_{2} \mathrm{CuS}_{4}$, 4.0391(3), 13.815(1), 13.860(1); $\mathrm{CsLa}_{2} \mathrm{CuSe}_{4}$, 4.3129(6), 14.959(2), 14.798(2); $\mathrm{CsSm}_{2} \mathrm{CuSe}_{4}, \quad 4.2066(3)$, 14.6101(9), 14.5164(9). The corresponding $R_{1}$ indices for the refined structures are $0.0264,0.0196,0.0258$, and 0.0224 . The cell dimensions of $A \operatorname{Ln}_{2} M_{3} Q_{5}$ are as follows: $\mathrm{RbEr}_{2} \mathrm{Cu}_{3} \mathrm{~S}_{5}, 3.9283(3)$, 13.897(1), 16.348(1); $\mathrm{CsGd}_{2} \mathrm{Ag}_{3} \mathrm{Se}_{5}$, 4.2943(4), 15.424(1), 17.501(2); $\mathrm{CsTb}_{2} \mathrm{Ag}_{3} \mathrm{Se}_{5}$, 4.2779(4), 15.429(2), 17.426(2). The $R_{1}$ indices are $0.0257,0.0255$, and 0.0241 . The cell dimensions of $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}\left(a, b, c(\AA), \beta\left({ }^{\circ}\right)\right)$ is 13.897(1), 3.9883(3), 16.054(1), 109.273(1), and the $R_{1}$ index is 0.0199 . All eight compounds have closely related three-dimensional tunnel structures. All alkali metal atoms in the tunnels are coordinated to eight $Q$ atoms. Their anionic frameworks are built from $\operatorname{Ln} Q_{6}$ octahedra and $M Q_{4}$ tetrahedra. $A L n_{2} \mathrm{Cu} Q_{4}$ contains ${ }_{\infty}^{1}\left[\mathrm{Cu} Q_{3}\right]$ chains of vertex-sharing tetrahedra; $\mathbf{R b}_{\mathbf{2}} \mathbf{G d}_{4} \mathbf{C u}_{4} \mathrm{~S}_{9}$ contains ${ }_{\infty}^{1}\left[\mathrm{Cu}_{4} \mathrm{~S}_{8}\right]$ chains of tetrahedra; and $A L n_{2} M_{3} Q_{5}$ contains ${ }_{\infty}^{2}\left[M_{3} Q_{5}\right]$ layers of tetrahedra. $\mathrm{Rb}_{2} \mathbf{G d}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ and $\mathrm{RbEr}_{2} \mathrm{Cu}_{3} \mathrm{~S}_{5}$, which are paramagnetic, obey the Curie-Weiss law, and have effective magnetic moments of 7.9(2) $\mu_{\mathrm{B}}$ for $\mathbf{G d}^{3+}$ and 9.43(5) $\mu_{\mathrm{B}}$ for $\mathrm{Er}^{3+}$. A band gap of 1.94 eV for $\mathrm{Rb}_{\mathbf{2}} \mathbf{G d}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ was deduced from its diffuse reflectance spectrum, and the typical $4 f-4 f$ optical transitions for $\mathbf{E r}^{3+}$ were found in $\mathbf{R b E r}_{2} \mathbf{C u}_{3} \mathbf{S}_{5}$ at about 1.6, 1.9, and 2.5 eV .

## INTRODUCTION

A number of $A / L n / M / Q(A=s$-block metal; $L n=f$-block element, usually a rare earth; $M=d$-block element; $Q=$ chalcogen $=\mathrm{S}, \mathrm{Se}, \mathrm{Te}$ ) systems have been synthesized, since the development of the reactive flux method $(1,2)$. These include $\mathrm{Rb} \mathrm{Ln}_{2} \mathrm{CuSe}_{4} \quad(L n=\mathrm{Sm}, \mathrm{Gd}$, Dy) (3),
 $\mathrm{CsUTiTe}_{5}(4), \mathrm{BaLnM} Q_{3}(L n=$ rare-earth; $M=\mathrm{Cu}, \mathrm{Ag}$, $\mathrm{Au} ; Q=\mathrm{S}, \mathrm{Se}, \mathrm{Te})(5-8), \mathrm{Ba}_{2} \operatorname{LnAg}_{5} \mathrm{~S}_{6}(\operatorname{Ln}=\mathrm{La}, \mathrm{Y})(9)$, $\mathrm{K}_{1.5} \mathrm{Dy}_{2} \mathrm{Cu}_{2.5} \mathrm{Te}_{5} \quad$ (8), $\quad \mathrm{K}_{0.5} \mathrm{Ba}_{0.5} \mathrm{DyCu}_{1.5} \mathrm{Te}_{3}$ $\mathrm{KGd}_{2} \mathrm{CuS}_{4}(10), \mathrm{K}_{2} \mathrm{CeCu}_{2} \mathrm{~S}_{4}(11), A \operatorname{LnCu} \mathrm{~S}_{6}(A=\mathrm{K}, \mathrm{Cs} ;$ $L n=\mathrm{La}, \mathrm{Ce}, \mathrm{Eu})(11-13), A \operatorname{LnCu} Q_{3}(A=\mathrm{K}, \mathrm{Cs} ; L n=\mathrm{Ce}$, $\mathrm{U} ; Q=\mathrm{S}, \mathrm{Se}, \mathrm{Te})(4,13), \mathrm{K}_{2} \mathrm{CeAg}_{3} \mathrm{Te}_{4}(14), \mathrm{KCeCuTe}_{4}(15)$, and $\mathrm{Rb}_{2} \mathrm{CeCu}_{3} \mathrm{Te}_{5}$ (16). These compounds crystallize in a variety of structure types that include two-dimensional layered structures and three-dimensional tunnel structures. The $M$ atoms (except Ti ) are tetrahedrally coordinated by chalcogen atoms. These tetrahedra enter into chains, layers, and other frameworks. The compounds $A \operatorname{LnCu} \mathrm{~S}_{2}$, $\mathrm{KCeCuTe}_{4}$, and $\mathrm{Rb}_{2} \mathrm{CeCu}_{3} \mathrm{Te}_{5}$ all contain $Q-Q$ bonds and have layered structures. The coordination environment of these $L n$ atoms are bicapped or tricapped trigonal prisms. In the compounds without $Q-Q$ bonding interactions, each $L n$ atom is coordinated to an octahedron of six $Q$ atoms. These compounds provide considerable information about how diverse chalcogenide structures are constructed from octahedra and tetrahedra.

Here we report the syntheses and structural characterization of eight new compounds containing $f$ - and $d$-block metals, namely $\mathrm{RbNd}_{2} \mathrm{CuS}_{4}, \mathrm{RbSm}_{2} \mathrm{CuS}_{4}, \mathrm{CsLa}_{2} \mathrm{CuSe}_{4}$, $\mathrm{CsSm}_{2} \mathrm{CuSe}_{4}, \mathrm{RbEr}_{2} \mathrm{Cu}_{3} \mathrm{~S}_{5}, \mathrm{CsGd}_{2} \mathrm{Ag}_{3} \mathrm{Se}_{5}, \mathrm{CsTb}_{2} \mathrm{Ag}_{3} \mathrm{Se}_{5}$, and $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$. They all possess three-dimensional structures containing similar tunnels. In addition, we report the magnetic and optical properties of $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ and $\operatorname{RbEr}_{2} \mathrm{Cu}_{3} \mathrm{~S}_{5}$.

973 K for 3 days, slowly cooled at $10 \mathrm{~K} / \mathrm{h}$ to 473 K , and then cooled to room temperature. Major products in all instances were red $\left(A L n_{2} \mathrm{Cu}_{4}\right.$ and $\left.\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}\right)$ or brown $\left(A L n_{2} \mathrm{M}_{3} Q_{5}\right)$ needles of the desired materials. Yields varied from 70 to $90 \%$. Selected single crystals were examined with an EDX-equipped Hitachi S-4500 SEM and found to have the stated compositions within the accuracy of the method $( \pm 5 \%)$. All these compounds are modestly stable in air.

## Crystallography

Single-crystal X-ray diffraction data were obtained with the use of graphite-monochromatized $\operatorname{Mo} K \alpha$ radiation $(\lambda=0.71073 \AA)$ at 153 K on a Bruker Smart-1000 CCD diffractometer (17). The crystal-to-detector distance was 5.023 cm . Crystal decay was monitored by recollecting 50 initial frames at the end of data collection. Data were collected by a scan of $0.3^{\circ}$ in $\omega$ in groups of 606, 606, and 606 frames at $\varphi$ settings of $0^{\circ}, 120^{\circ}$, and $240^{\circ}$ for all the compounds except $\mathrm{CsSm}_{2} \mathrm{CuSe}_{4}$ for which 606, 606, 606, and

606 frames at $\varphi$ settings of $0^{\circ}, 90^{\circ}, 180^{\circ}$, and $270^{\circ}$ were collected. The exposure times were $15 \mathrm{~s} /$ frame for all the compounds. The collection of intensity data on the Bruker diffractometer was carried out with the program SMART (17). Cell refinement and data reduction were carried out with the use of the program SAINT (17) and face-indexed absorption corrections were carried out numerically with the program XPREP (18). Then the program SADABS (17)

was employed to make incident beam and decay corrections.
The structures were solved with the direct methods program SHELXS and refined with the full-matrix leastsquares program SHELXL of the SHELXTL-PC suite of programs (18). Each final refinement included anisotropic displacement parameters and a secondary extinction correction. Additional crystallographic details are given in Table 1. Tables 2, 3, and 4 give positional parameters and equivalent isotropic displacement parameters, and Tables 5 , 6 , and 7 present selected bond distances for $\mathrm{RbNd}_{2} \mathrm{CuS}_{4}$, $\mathrm{RbSm}_{2} \mathrm{CuS}_{4}, \mathrm{CsLa}_{2} \mathrm{CuSe}_{4}, \mathrm{CsSm}_{2} \mathrm{CuSe}_{4}, \mathrm{RbEr}_{2} \mathrm{Cu}_{3} \mathrm{~S}_{5}$, $\mathrm{CsGd}_{2} \mathrm{Ag}_{3} \mathrm{Se}_{5}, \mathrm{CsTb}_{2} \mathrm{Ag}_{3} \mathrm{Se}_{5}$, and $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$.

## Magnetic Susceptibility

A $20-\mathrm{mg}$ sample of $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ and a $15-\mathrm{mg}$ sample of $\mathrm{RbEr}_{2} \mathrm{Cu}_{3} \mathrm{~S}_{5}$ containing single crystals were used for mag-

tance spectra of the compounds $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ and $\mathrm{RbEr}_{2} \mathrm{Cu}_{3} \mathrm{~S}_{5}$ over the range $350 \mathrm{~nm}(3.54 \mathrm{eV})$ to 900 nm $(1.38 \mathrm{eV})$ at 293 K .

## RESULTS AND DISCUSSION

The structure of the isostructural compounds $\mathrm{RbNd}_{2} \mathrm{CuS}_{4}, \mathrm{RbSm}_{2} \mathrm{CuS}_{4}, \mathrm{CsLa}_{2} \mathrm{CuSe}_{4}$, and $\mathrm{CsSm}_{2} \mathrm{CuSe}_{4}$ is illustrated in Fig. 1. This is the $\mathrm{KGd}_{2} \mathrm{CuS}_{4}$ structure type

FIG. 5. The ${ }_{\infty}^{2}\left[L n_{2} Q_{5}\right]$ layer of $A L n_{2} M_{3} Q_{5}$ viewed down [010]. The ${ }_{\infty}^{1}\left[L n_{2} Q_{6}\right]$ chain is in the dashed box.

FIG. 7. The $L n / Q$ fragment of $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ viewed down [010]. The ${ }_{\infty}^{2}\left[L n_{2} Q_{5}\right]$ layer is in the dashed box.
(10). The structure of the isostructural compounds $\mathrm{RbEr}_{2} \mathrm{Cu}_{3} \mathrm{~S}_{5}, \mathrm{CsGd}_{2} \mathrm{Ag}_{3} \mathrm{Se}_{5}$, and $\mathrm{CsTb}_{2} \mathrm{Ag}_{3} \mathrm{Se}_{5}$ is illustrated in Fig. 2. This is the $\mathrm{RbSm}_{2} \mathrm{Ag}_{3} \mathrm{Se}_{5}$ structure type (3). The structure of $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$, a new structure type, is illustrated in Fig. 3. These three structures all have threedimensional tunnel frameworks with similarly shaped tun-

FIG. 8. Unit cell of $A L n_{2} \mathrm{Cu} Q_{4}$ viewed down [100] with only $\mathrm{Cu}-Q$ bonds shown.
nels. Each tunnel is only large enough in cross section to accommodate one $A$ atom. The tunnel in $A L n_{2} \mathrm{Cu} Q_{4}$ comprises a 10 -membered ring of two $\mathrm{Cu}-Q$ bonds and eight $L n-Q$ bonds, that in $A L n_{2} M_{3} Q_{5}$ consists of a 10 -membered ring of six $M-Q$ bonds and four $L n-Q$ bonds, and that in $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ consists of a $10-$ membered ring of four $\mathrm{Cu}-\mathrm{S}$ bonds and six Gd-S bonds.

FIG. 9. Unit cell of $A L n_{2} M_{3} Q_{5}$ viewed down [100] with only $M-Q$ bonds shown.

FIG. 10. Unit cell of $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ viewed down [010] with only $\mathrm{Cu}-\mathrm{S}$ bonds shown.

The entire framework in each of the three structure can be derived topologically from the NaCl structure. When larger eight-coordinated $A$ atoms and smaller four-coordinated $M$ atoms replace some of the six-coordinated $\operatorname{Ln}$ atoms, the NaCl -like $L n / Q$ framework distorts. Some alkali-metal/ rare-earth/chalcogenides, such as $A \operatorname{Ln} Q_{2}(20,21), \mathrm{CsEr}_{3} \mathrm{Se}_{5}$ (22), and $A_{3}{L n_{7}} \mathrm{Se}_{12}(22,23)$, are three-dimensional $\mathrm{NaCl}-$ like tunnel structures built from $\operatorname{Ln} Q_{6}$.

FIG. 11. Plots of the inverse molar susceptibility $(1 / \chi)$ vs $T$ for (a) $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ and (b) $\mathrm{RbEr}_{2} \mathrm{Cu}_{3} \mathrm{~S}_{5}$, where the solid lines are the least-squares fit.

The three-dimensional anionic frameworks in the three structures are built from $\operatorname{Ln} Q_{6}$ octahedra and $M Q_{4}$ tetrahedra, as shown in Figs. 1, 2, and 3. The $L n / Q$ fragments in these structures consist of similar ${ }_{\infty}^{2}\left[L n_{2} Q_{5}\right]$ layers, as shown in Figs. 4, 5, 6, and 7. As an example, the ${ }_{\infty}^{2}\left[\operatorname{Ln}_{2} Q_{5}\right]$ layer in $A n_{2} M_{3} Q_{5}$ is displayed in Fig. 5. This layer is composed of ${ }_{\infty}^{1}\left[L n_{2} Q_{6}\right]$ chains along [100], which are built from the edge-sharing of $\operatorname{Ln} Q_{6}$ octahedra. These chains are connected to each other by the vertex-sharing of $Q$ atoms to form the two-dimensional ${ }_{\infty}^{2}\left[L n_{2} Q_{5}\right]$ layer (Fig. 5). The

FIG. 12. Diffuse reflectance spectra of (a) $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ and (b) $\mathrm{RbEr}_{2} \mathrm{Cu}_{3} \mathrm{~S}_{5}$.
${ }_{\infty}^{2}\left[L n_{2} Q_{5}\right]$ layers in $A L n_{2} \mathrm{Cu}_{4}$ and $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ are connected to their neighboring layers by the edge-sharing of two $Q$ atoms to form the three-dimensional frameworks (Figs. 4 and 7), but such connections are not present in $A L n_{2} M_{3} Q_{5}$ (Fig. 6). In $A L n_{2} \mathrm{Cu}_{4}$ and $A L n_{2} M_{3} Q_{5}$ there is only one unique $L n$ atom and one unique ${ }_{\infty}^{1}\left[L n_{2} Q_{6}\right]$ chain, but in $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ there are two Gd atoms ( $\mathrm{Gd} 1, \mathrm{Gd} 2$ ) and two chains. Each ${ }_{\infty}^{1}\left[\operatorname{Ln}_{2} Q_{6}\right]$ chain in $A n_{2} \mathrm{Cu} Q_{4}$ is connected to two chains in the neighboring layers by edgesharing (Fig. 4). Although the ${ }_{\infty}^{1}\left[\mathrm{Gd}_{2} \mathrm{~S}_{6}\right]$ chain in $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ is not linked to other layers, each ${ }_{\infty}^{1}\left[\mathrm{Gd}_{2} \mathrm{~S}_{6}\right]$ chain is connected to other layers (Fig. 7) in a manner similar to the ${ }_{\infty}^{1}\left[\operatorname{Ln}_{2} Q_{6}\right]$ chains in $A L n_{2} \mathrm{Cu} Q_{4}$. In going from $A L n_{2} M_{3} Q_{5}$ to $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ to $A L n_{2} \mathrm{Cu} Q_{4}$, the $Q: L n$ ratio decreases. As a consequence, the linkages between the layers increase and the ${ }_{\infty}^{2}\left[n_{2} Q_{5}\right]$ layer becomes more distorted, as shown in Figs. 4, 6, and 7. The $A: \operatorname{Ln}$ ratio in the three structures is $1: 2$, but the $M: \operatorname{Ln}$ ratio decreases from 3:2 to $1: 1$ to $1: 2$. In fact, the $L n / Q$ framework in $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ can be considered to be an intermediate phase.

In order to understand the coordination environments of $M$, Figs. 8,9 , and 10 show only $M-Q$ bonds. $A L n_{2} \mathrm{Cu}_{4}$ contains some isolated $Q^{2-}$ species and one-dimensional vertex-sharing $M Q_{4}$ tetrahedra that result in single ${ }_{\infty}^{1}\left[\mathrm{Cu}_{3}\right]$ chains running along the [100] direction (Fig. 8) $A L n_{2} M_{3} Q_{5}$ contains single ${ }_{\infty}^{1}\left[M Q_{3}\right]$ chains as well as double ${ }_{\infty}^{1}\left[M_{2} Q_{4}\right]$ chains made up from two edge-sharing single ${ }_{\infty}^{1}\left[M Q_{3}\right]$ chains; the single chains and double chains are connected together by vertex-sharing to form the twodimensional ${ }_{\infty}^{2}\left[M_{3} Q_{5}\right]$ layer (Fig. 9). $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ contains one-dimensional ${ }_{\infty}^{1}\left[\mathrm{Cu}_{4} \mathrm{~S}_{8}\right]$ chains made up of two single ${ }_{\infty}^{1}\left[\mathrm{CuS}_{3}\right]$ chains and one ${ }_{\infty}^{1}\left[\mathrm{Cu}_{2} \mathrm{~S}_{4}\right]$ double chain (Fig. 10).

Selected bond distances for $\mathrm{RbNd}_{2} \mathrm{CuS}_{4}, \mathrm{RbSm}_{2} \mathrm{CuS}_{4}$, $\mathrm{CsLa}_{2} \mathrm{CuSe}_{4}, \mathrm{CsSm}_{2} \mathrm{CuSe}_{4}, \mathrm{RbEr}_{2} \mathrm{Cu}_{3} \mathrm{~S}_{5}, \mathrm{CsGd}_{2} \mathrm{Ag}_{3} \mathrm{Se}_{5}$, $\mathrm{CsTb}_{2} \mathrm{Ag}_{3} \mathrm{Se}_{5}$, and $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ are listed in Tables 5, 6, and 7. In these structures all $A$ atoms are in bicapped trigonal prisms of eight $Q$ atoms with reasonable $A-Q$ distances. $L n-Q$ distances are unexceptional and decrease from Nd to Er , as expected from the lanthanide contraction.

Plots of the reciprocal of the molar susceptibility $(1 / \chi)$ vs $T$ for $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ and $\mathrm{RbEr}_{2} \mathrm{Cu}_{3} \mathrm{~S}_{5}$ are shown in Fig. 11. Both of these materials are paramagnetic in the range of $5-300 \mathrm{~K}$. The susceptibility data were fit by a leastsquares method to the Curie-Weiss equation $\chi=C /(T-\theta)$, where $C$ is the Curie constant and $\theta$ is the Weiss constant. The resulting values for $C$ and $\theta$ are 7.8(1) emu $\mathrm{K} \mathrm{mol}^{-1}$ and $-8.9(2) \mathrm{K}$ for $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ and $11.12(4) \mathrm{emu} \mathrm{K} \mathrm{mol}^{-1}$ and $-7.60(5) \mathrm{K}$ for $\mathrm{RbEr}_{2} \mathrm{Cu}_{3} \mathrm{~S}_{5}$. The calculated effective magnetic moments of 7.9(2) $\mu_{\mathrm{B}}$ and 9.43(5) $\mu_{\mathrm{B}}$ agree well with the theoretical values of $7.94 \mu_{\mathrm{B}}$ and $9.58 \mu_{\mathrm{B}}$ for $\mathrm{Gd}^{3+}$ and $\mathrm{Er}^{3+}$, respectively (24).

The diffuse reflectance spectra of $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ and $\mathrm{RbEr}_{2} \mathrm{Cu}_{3} \mathrm{~S}_{5}$ from 1.5 to 3.5 eV are shown in Fig. 12. An optical band gap of 1.94 eV for $\mathrm{Rb}_{2} \mathrm{Gd}_{4} \mathrm{Cu}_{4} \mathrm{~S}_{9}$ was deduced with the use of a straightforward extrapolation method (25). This gap is consistent with the red color of the material. $\mathrm{RbEr}_{2} \mathrm{Cu}_{3} \mathrm{~S}_{5}$ exhibits a typical $\mathrm{Er}^{3+}$ absorption spectrum, with $4 f-4 f$ transitions at approximately $1.6,1.9$, and 2.5 eV .
