

## Bibliography Section

---

The aim of the Bibliography Section is to provide a rapid survey of the international literature on thermal investigation for individuals working in this field.

Every effort will be made, as far as is technically possible, to include all the latest publications and, thus, to make our Bibliography Section up-to-date. We wish to emphasize that, however carefully prepared, this compilation cannot be complete owing to the fact that we intend to keep our readers informed without delay.

In view of the enormous number of papers published it is proposed to give only the name and working-place of the authors, the title of communications and the place of publication. A translation of the titles of publications other than those in English, French or German is presented, the original language being indicated in brackets.

Abstracts that cover the field broadly and in detail can be found in "Thermal Analysis, Review" published by Stanton Instruments, Ltd.

The Editor will gladly accept reprints, bibliographical comments and suggestions.
