$m\mu$ (log ϵ) at 235 (4.26), 327 (3.78), 368 (3.59) and 392 (3.11) and minima at 273 (3.25), 363 (3.57) and 387 (3.30). II absorbs four molar equivalents of hydrogen in ethanol with platinum oxide giving an oil oxidized with permanganate to pimelic acid, m. p. 99–102° (m. p. 100–102° in admixture with authentic material, m. p. 101– 102°). These facts are consistent with the assignment of tropolone (IIa) as the structural hypothesis for II but do not completely exclude IIb.

This investigation was supported in part by a research grant from the National Institutes of Health, Public Health Service, and in part by a research grant from the American Cancer Society.

THE ACTION OF METHANOLIC POTASSIUM HYDROXIDE ON A Δ^{16} -20-KETOSTEROID: ISOLATION OF 3β -ACETOXY-16-METHOXY- Δ^{5} -PREGNEN-20-ONE

Sir:

The reaction recently described by Marker¹ for the introduction of a 17-hydroxyl group could have great significance in the synthesis of adrenal cortical hormones. Since no evidence was offered for the presence of a 17-hydroxyl group other than failure to acetylate the newly introduced oxygen function, and since the reaction postulated was improbable, we have investigated the problem and have arrived at a completely different conclusion.

3 β -Acetoxy- $\Delta^{5,16}$ -pregnadien-20-one was refluxed with a solution of potassium hydroxide in methanol. As evidenced by the ultraviolet absorption spectrum, $E_{1 \text{ cm.}}^{1\%} = 121 \text{ at } 2390 \text{ Å., ap-}$ proximately half the product no longer contained the α,β -unsaturated carbonyl group of the initial compound. Acetylation followed by chromatography resulted in the separation of 3β -acetoxy- $\Delta^{5,16}$ -pregnadien-20-one and a compound, m. p. $158.5-159.5^{\circ}$; $[\alpha]^{25}D - 28.5^{\circ}$ (chloroform), which showed no absorption in the ultraviolet above 2250 Å. The possibility that the compound was a 3β -acetoxy-17-hydroxy- Δ^{5} -pregnen-20-one was readily eliminated by comparison of the physical constants with the known epimers $(17\alpha^{-2} \text{ m. p.} 234-235^{\circ}; [\alpha]_{D} - 41.8^{\circ} \text{ [dioxane]}; 17\beta^{-3} \text{ m. p.} 187-188^{\circ}; [\alpha]_{D} - 61.3^{\circ} \text{ (chloroform)}). A D$ homosteroid was similarly discarded as a possible interpretation. The most important evidence against these structures was provided by infrared spectrometry⁴ which revealed that no free hydroxyl group was present in the product.

The elementary analysis conformed to the

molecular formula $C_{24}H_{36}O_4$. Anal. Calcd.: C, 74.29; H, 9.34. Found: C, 74.53; H, 9.18. The additional carbon atom was shown to be in a methoxyl group by Zeisel determination (calcd. 7.99; found 8.59). When an ethanol solution of potassium hydroxide was used for the reaction a different product, the corresponding ethoxy compound, was obtained, m. p. 143–144.5°, $[\alpha]_D$ -30.6° (chloroform). These results clearly prove that the reaction led to the formation of an ether rather than an alcohol. An examination of Marker's analytical data shows that there is equally good agreement for a methoxy derivative.

The addition of alcohol to an α,β -unsaturated 20-ketosteroid is entirely analogous to the basecatalyzed addition of alcohols to methyl acrylate or acrylonitrile to yield β -alkoxy propionic acid derivatives.⁵ The product formed from 3 β acetoxy- $\Delta^{5,16}$ -pregnadien-20-one upon treatment with methanolic potassium hydroxide is therefore 3β -hydroxy-16-methoxy- Δ^{5} -pregnen-20-one. The reaction is reversible, and an equilibrium mixture containing 69% of the 16-methoxy compound spectrophotometrically is reached from either compound at 23° in 3% methanolic potassium hydroxide in about two hours.
