> Received April 18, 1995 Revised Manuscript Received July 31, 1995

Development of a general synthetic method for the construction of seven-membered carbocycles or the annulation of a seven-membered ring onto an existing carbocycle has been an active area of research, in part due to a wide occurrence of hydroazulenic sesquiterpenes and related bicyclic natural prod-Among many elegant synthetic methods that have emerged, the Cope rearrangement of cis-divinylcyclopropanes proved to be of considerable synthetic utility.²⁻⁵ Herein we report a diastereoselective synthesis of cis-1,2-dialkenylcyclopropanols (2: R = H and tert-butyldimethylsilyl) and subsequent oxy-Cope rearrangement $(2 \rightarrow 3)$ under relatively mild conditions.6

$$(CH_2)_n \xrightarrow{CO_2Me} (CH_2)_n \xrightarrow{RO} (CH_2)_n \xrightarrow{H} \xrightarrow{H} \xrightarrow{Y}$$

We envisioned that a convenient assembly of cis-1,2dialkenylcyclopropanols could be developed by the Kulinkovich hydroxycyclopropanation, which involves treatment of a carboxylic ester with an excess (3 equiv) of Grignard reagent at -78 to 0 °C in the presence of Ti(O-i-Pr)₄ (1 equiv), affording 1-alkylcyclopropan-1-ols in good yields!⁷ In the case of 2-phenethylmagnesium bromide, Kulinkovich and co-workers documented the formation of the corresponding cis-1,2-disubstituted cyclopropanols.7b They also developed a catalytic process [2 equiv of Grignard reagent, 5-10 mol % Ti(O-i-Pr)4,

(6) A stereoselective preparation of cis-1,2-divinylcyclopropanes is of practical importance, since the corresponding trans-divinyleyclopropanes often undergo a competing homo [1,5]-sigmatropic shift. ether, 20 °C] and put forth an attractive reaction mechanism which involves the formal "double alkylation" of titanacyclo-propane intermediate 5 (Scheme 1).7cd,8-10 More recently, Corey reported an improved procedure for this hydroxycyclopropanation, along with the unequivocal determination of exceptionally high diastereoselectivity for cis-1,2-disubstituted cyclopropanols and an enantioselective version mediated by a chiral C_2 symmetric diol ligand. 11

Our initial efforts were directed at the application of the Kulinkovich cyclopropanation to commercially available methyl 1-cyclohexene-1-carboxylate (9) (Scheme 2). Addition of EtMgBr or n-BuMgCl to 9 in the presence of Ti(O-i-Pr)₄ under catalytic conditions gave the expected cyclopropanols 10a and 10b, respectively (46-54%; unoptimized yield). However, none of the desired product was isolated from the use of CH2=CHCH2-CH₂MgBr under identical reaction conditions; a complex mixture of the unidentified products was found. No cyclopropanols were obtained from (2-(3'-furanyl)ethyl)magnesium bromide¹² or 2-phenethylmagnesium bromide.¹³ If the reactions

Scheme 3

with these substrates had been successful, this procedure would have provided a one-step synthesis of the requisite substrates for the subsequent oxy-Cope rearrangement.

These disappointing results prompted us to employ a 4-alkoxybutyl Grignard reagent. Indeed, both reagents 11a,b gave the desired cyclopropanols 12a,b in 77% and 46% yield (under stoichiometric conditions), respectively (Scheme 3). Removal of the protecting group provided alcohol 13 as a single isomer. Unfortunately, several attempts to convert 13 into olefin 14 were unsuccessful. This unexpected difficulty was circumvented by the formation of the silyl enol ether: Swern oxidation (1.5 equiv of oxalyl chloride and 2.5 equiv of DMSO in CH2Cl2, followed by 5.0 equiv of Et₃N) of alcohol 13, followed by treatment with TBSOTf and triethylamine, 14 resulted in the exclusive formation of the (Z)-silyl enol ether 15a (J = 5.9 Hz), along with a small amount of 15b. When heated at reflux in benzene, the enol ethers underwent the oxy-Cope rearrangement to provide bicyclic cycloheptadiene 16a in 72% overall yield from 13, along with 4% of 16b. 15 The stereochemical assignment of 16a was initially made by consideration of the transition state for the Cope rearrangement of divinylcyclopropanes and was unequivocally confirmed by difference NOE spectroscopy of cyclopropane 20, which was readily prepared from cyclopropanation of 16a (vide infra). 16

Oxidation of alcohol 13 could also be accomplished by the Saigo—Mukaiyama protocol¹⁷ or TPAP. 18 As outlined above, the resulting aldehyde was then directly converted into cycloheptadiene 16a in 69% and 57% overall yield (from 13), respectively.

The identical synthetic sequence on methyl 1-cyclopentene-1-carboxylate (17)¹⁹ afforded hydroazulene 19 in 53% overall yield by means of cyclopropanol 18 (Scheme 4).²⁰

(15) No purification is necessary for $13 \rightarrow 16a,b$.

(16) Difference NOE data of 20 are included in the supporting informa-

Scheme 4

Scheme 5

Having developed a convenient synthetic method for fused bicyclic systems 16a and 19, we briefly examined subsequent elaborations of the cycloheptadiene functionality. For example, Simmons-Smith cyclopropanation (CH₂I₂, Et₂Zn)²¹ of **16a** gave cyclopropane 20 as a single diastereomer (75%) (Scheme 5). The stereochemical assignment was firmly established on the basis of the NOE difference experiment. 16 Hydrogenation (H₂, Pd/C) of the remaining double bond, followed by treatment with HF in aqueous acetonitrile, produced ketone 21 in 69% overall yield. Treatment of 16a with dichlorocarbene²² gave dichlorocyclopropane 22 in nearly quantitative yield. Hydrogenation (H₂, Pd/C), followed by treatment with silver nitrate in aqueous acetone, resulted in one-carbon ring expansion to afford ketal 23, a bicyclo[6.4.0]dodecanone derivative, in 70% overall yield.²³ Also, hydrogenation (H₂, Pd/C) of 16a took place readily to give the fully reduced product 24.

In summary, tandem application on 1-cycloalkene-1-carboxylate of the Kulinkovich hydroxycyclopropanation and the oxy-Cope rearrangement provides a stereoselective synthesis of fused bicyclic compounds (such as bicyclo[5.4.0]undecanes or bicyclo-[6.4.0]dodecanes) bearing several sites for further structural elaboration. Further mechanistic and synthetic studies, as well as the development of enantioselective hydroxycyclopropanation,20 will be reported in due course.

Acknowledgment. We are grateful to the National Institutes of Health (GM35956) for generous financial support. One of us (J.K.C.) also thanks the National Institutes of Health for a Research Career Development Award (GM00575). We thank Dr. Ken Belmore for the difference NOE measurement of 20.
