

Correction to “Supramolecular Autoregulation”

Francisco Rodríguez-Llansola and E. W. Meijer*

J. Am. Chem. Soc. **2013**, *135*, 6549–6553. DOI: 10.1021/ja4006833

The published paper reported on the autoregulation of a Michael addition between 2,4-pentanedione and *trans*- β -nitrostyrene catalyzed by 2,7-diamido-1,8-naphthyridine (NaPy). Recently, we found out that the observed catalytic activity of NaPy stems from a strong synergy between NaPy and trace amounts of K_2CO_3 . NaPy is proposed to be the phase-transfer catalyst for K_2CO_3 , resulting in a more than 100-fold increase in reaction rate compared to the two compounds separately. The required presence of K_2CO_3 is not described in the published paper. However, this finding does not influence the supramolecular autoregulation of NaPy in the reactions described.
