

stance, improved extraction processes may in themselves so improve the quality of the crude oil as to greatly lessen the extent and severity of the treatment during refining, bleaching, and deodorizing, and consequently decrease the possibilities for losses and some of the expense involved in these operations. In connection with refining losses, Mr. Guy S. Meloy's remarks in his paper presented at this meeting on his tentative theories concerning the production of free fatty acids in cottonseed oil during the development of the seed may bring about a general improvement in the quality of cottonseed oil. It is certainly uneconomic to market cottonseed with a high free fatty acid content.

It is obvious, of course, that much of the program that I have been discussing with reference to cottonseed oil applies also to peanut oil, and it is expected that the protein and oil problems of these two crops will be studied simultan-

eously. There will be other projects, which, naturally, will be of less interest to this group, as for example, those on carbohydrates for increasing the industrial utilization of sweetpotato starch.

I have mentioned previously the purpose of research in these Regional Laboratories and I should like to state it again. The ultimate objective of the work of the laboratories *must* be and *will* be the increased *industrial use of the products of agriculture*. Every effort will, therefore, be made to have the scientific and engineering projects at the Regional Laboratories so organized as to be promptly adaptable to industries' use. As soon as any project matures to the point that industrial development is justified, every facility of the laboratories will be afforded to those interested so that they may put into practice the experimental findings at the earliest practicable date. The fact that industrial research laboratories have been very

generous in cooperation during the Survey indicates that continued cooperation can be expected.

The Southern Laboratory is off to a good start in that we are getting splendid cooperation from the agriculture colleges, experiment stations and private laboratories and industries in this Region. That's exactly what we want. We want all the educational institutions, agricultural organizations and interested industries in the States that comprise the Southern Region to realize that the amount of help rendered by this Laboratory will depend, to a very great extent, on the cooperation it can develop.

In conclusion I want to say that we expect to put our best efforts into the Southern Laboratory. We plan to work for something worthwhile instead of something spectacular. In short, we plan to do our best to help the farmers of the South find new and more profitable outlets for their crops.

## Report of the Refining Committee 1938-9

### Expeller and Hydraulic Soybean Oils

It will be recalled that the tentative refining methods for expeller and hydraulic soybean oils, adopted after the Committee activities of 1936-37, were changed slightly after last year's cooperative study and were continued as tentative. The cooperative examination of these methods has been carried on again this year. Four check samples were sent to the Committee and the detailed results on individual samples are given on the attached tabulations covering samples numbered 1, 2, 5, and 6. Another tabulation ("Percentage Accuracy") shows the percentage of results both as to losses and color readings falling within the several tolerance limits up to within 0.5% of the average and over 0.5%. For ready reference, the following condensed tabulation will give the degree of accuracy based on the percentage of refining results falling within 0.3% of the average, within 0.5% of the average, and over 0.5%:

#### Expeller Oil

|                     | Maximum Lye         | 2/3 Maximum Lye |
|---------------------|---------------------|-----------------|
| No. 1               | Results within 0.3% | 75.0%           |
|                     | Results within 0.5% | 8.3%            |
|                     | Results over 0.5%   | 16.7%           |
| No. 2               | Results within 0.3% | 75.0%           |
|                     | Results within 0.5% | 12.5%           |
|                     | Results over 0.5%   | 12.5%           |
| No. 5               | Results within 0.3% | 80.0%           |
|                     | Results within 0.5% | 6.7%            |
|                     | Results over 0.5%   | 13.3%           |
| No. 6               | Results within 0.3% | 75.0%           |
|                     | Results within 0.5% | 12.5%           |
|                     | Results over 0.5%   | 12.5%           |
| Grand Average:      |                     |                 |
| Results within 0.3% | 76.3%               | 60.3%           |
| Results within 0.5% | 10.0%               | 15.8%           |
| Results over 0.5%   | 13.7%               | 23.9%           |

It will be noted that with maximum lye, 86.3% of the reported refining losses were within 0.5% of the average, and that 76.1% were within 0.5% of the average with the 2/3 maximum lye. The Chairman considers this an excellent showing, particularly in view of the lack of experience of a number of members of the Committee with this type of analytical method.

#### Extracted Oil

The Committee last year recommended the tentative adoption of a method for refining extracted soybean oil which appeared to give satisfactory results. The study of this method was continued this year through four cooperative samples numbered 3, 4, 7, and 8. The results reported on these samples are given on the attached tabulations. The percentage of results falling within the several tolerance limits are covered in the tabulation on "Percentage Accuracy." As in the case of the expeller and hydraulic oils, a condensed tabulation follows, giving the percentage of refining results falling within 0.3% of the average, within 0.5% of the average, and over 0.5%:

|       | % Maximum Lye (14 Be') | 2/3 Maximum Lye (14 Be') |
|-------|------------------------|--------------------------|
| No. 3 | Results within 0.3%    | 35.7%                    |
|       | Results within 0.5%    | 35.7%                    |
|       | Results over 0.5%      | 28.6%                    |
| No. 4 | Results within 0.3%    | 73.3%                    |
|       | Results within 0.5%    | 20.0%                    |
|       | Results over 0.5%      | 6.7%                     |
| No. 7 | Results within 0.3%    | 18.8%                    |
|       | Results within 0.5%    | 12.5%                    |
|       | Results over 0.5%      | 68.7%                    |
| No. 8 | Results within 0.3%    | 38.5%                    |
|       | Results within 0.5%    | 7.7%                     |
|       | Results over 0.5%      | 53.9%                    |

| Grand Average:      |       |       |
|---------------------|-------|-------|
| Results within 0.3% | 41.6% | 51.2% |
| Results within 0.5% | 18.9% | 18.3% |
| Results over 0.5%   | 39.5% | 30.5% |

Using  $\frac{1}{2}$  maximum lye (14 Bé) on extracted oil, 60.5% of the reported results were within 0.5% of the average, and with  $\frac{2}{3}$  maximum lye (14 Bé), 69.5% were within 0.5% of the average.

The consensus of the Committee and observations made in the Swift Laboratories indicate that 12 Bé lye is not suitable primarily because of lye water separation.

The results obtained on the cooperative extracted oil samples No. 3 and No. 4 can be considered satisfactory. The findings reported, however, on samples No. 7 and No. 8 lowered the grand average appreciably. There was considerable variation even in the

F.F.A. determination on these two samples. The Chairman suspects that there was something abnormal about these oils.

#### Recommendation

The Refining Committee recommends, as a result of this season's work, that the tentative refining methods for expeller and hydraulic soybean oils, as changed and augmented last year and followed in this year's cooperative program, be adopted as official methods of the A.O.C.S.

The Committee recommends that the tentative method for extracted oil, as adopted last year, be studied further next year.

Yours respectfully,  
H. S. Mitchell, Chairman
