

Norris Embree Appointed to National Research Council

N. D. Embree (1940), vice-president in charge of technical operations, Distillation Products Industries Division of Eastman Kodak Company, has been appointed a member of the National Research Council in the Division of Chemistry and Chemical Technology. His term will be for a period of three years, through June, 1968.

N. D. Embree

He is serving the NRC as chairman of the division's Committee on Fats and Oils, and as a member of the Advisory Panel on Food Chemicals Codex and of the Industrial Liaison Panel of Food Protection Committee.

The Council has wide-ranging functions that include looking into the broad possibilities of science, stimulating research in general, promoting cooperation in research at home and abroad, and directing the attention of scientific and technical investigators to the importance of military and industrial problems in connection with national defense.

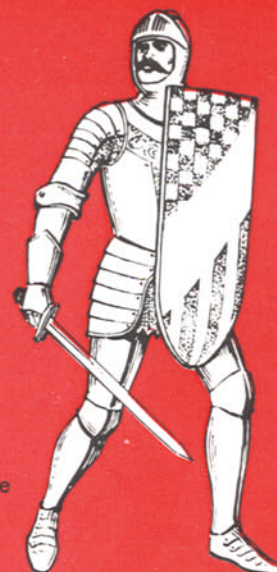

Dr. Embree began his association with Eastman Kodak in 1934. He was a member of the research and development group that became Distillation Products Industries in 1939. He has been concerned with the production of vitamins, fats, and oils and has directed research leading to many new methods and processes for high-vacuum distillation and for vitamin products.

Among numerous professional affiliations, he has served as president of the American Oil Chemists' Society, chairman of the Rochester Section of the American Chemical Society, and is currently a member of the advisory committee of the National Vitamin Foundation, of the research committee of the Pharmaceutical Manufacturers Association, of the advisory board of Gordon Research Conferences, and of the International Union of Pure and Applied Chemistry.

Sir Alfohol

THE ABSTERGENT

champion of surfactant alcohol performance

Fighting the clean fight in behalf of ALFOL® primary straight-chain alcohols, Sir Alfohol still represents the only full-scale source of synthetic fatty alcohols chemically identical with the natural materials. Conoco first came to the marketplace three years ago, when Sir Alfohol first began to battle "After-Foam" — the persistent dragon who lived on and on after the suds went down the drain.

Tailored blends of Conoco's ALFOL alcohols in the C₁₂ to C₁₈ range yield soft surfactants of all three functional types:

Anionic — straight-chain alcohol sulfate salts for excellent foaming, wetting, detergency; ether sulfate salts for superior heavy-duty or light-duty formulations

Nonionic — high-mole ethoxylates for outstanding deterative properties in light-duty and heavy-duty liquids and heavy-duty solids

Cationic — quaternary ammonium salts for bactericides, antistatic agents, corrosion inhibitors, etc.

ALFOL-based alcohol sulfates provide the fastest biodegradability of any synthetic product — equal to that for natural-based alcohol sulfates — and they provide equally good performance.

CONOCO'S ARMY OF SUPPORT PRODUCTS

ALFONIC® straight-chain ethylene oxide adducts and ether sulfate salts
NALKYLENE® linear alkylbenzenes plus their sulfonic acid derivatives and LAS slurries

CONOCO biodegradable hydrotropes
