Camag Model 12B TLC Starter Kit

Mallinckrodt TLC Teaching and Trial Kit

In 1960, Thomas learned of a new European analytical technique termed "Dünnschichtchromatographie". Investigation convinced our R.&D. staff that Thin Layer Chromatography—as it was translated—offered a novel method of separating mixtures to which paper chromatography was inapplicable.

We now offer four complete Kits as well as coating materials from Camag, Mallinckrodt, and Schleicher & Schuell. Individual components of Kits and many accessory items—several developed by Thomas—are listed separately to permit selection for specific needs. Pre-Coated Plates provide the ultimate in convenience.

**Camag Bibliography Service.** A periodic review of new techniques and applications. Copies are available from Thomas free upon request.

*Detailed descriptive literature sent upon request*

on its campus. In addition to the acknowledged leadership he exercised in the field of lipid chemistry during his academic career, George O. Burr holds the respect, admiration and affection of a large number of colleagues and students, for he is an unusually kind, thoughtful, warm-hearted and unassuming man.

The discovery of essential fatty acids has been of considerable economic importance to the industry concerned with edible oils, as well as to the science of nutrition. It is altogether fitting, therefore, that the American Oil Chemists' Society at its Los Angeles Meeting holds a Symposium on Essential Fatty Acids in Honor of George O. Burr, and that he be given a Special Award of the American Oil Chemists' Society to recognize an outstanding contribution to the branch of science to which the society is dedicated.

Canisius College Host to  
 Three Institutes in 1966

**Gas Chromatography Institute, April 11-15**

The Eighth Annual Institute on Gas Chromatography at Canisius College will feature an introduction to the theory of gas chromatography on Monday and Tuesday, April 11, 12. The last three days will feature three simultaneous sessions on industrial, biomedical and pesticide chromatography.

The industrial sessions will be under the direction of H. A. Szymanski of Canisius College.

The pesticide sessions will be under the direction of L. R. Mattiek of Cornell University. An extensive laboratory will be conducted in all the three areas of lecture sessions.

**Nuclear Magnetic Spectroscopy Institute,  
 June 21-25**

This will be an introductory course on theory and interpretation of proton magnetic resonance spectra with emphasis on the interpretation of the spectra of organic compounds.

The Institute will be limited to 25 attendees.

Laboratory sessions are under the direction of J. J. Colson of the Hooker Chemical Company. Lectures are to be given by H. A. Szymanski. Robert Yelin will assist in laboratory and work sessions.

A guest lecture at the end of the session will be on "NMR Spectra of Metal Complexes," by Dr. P. J. McCarthy, S. J.

**Infrared Spectroscopy Institute,  
 Aug. 29-Sept. 2**

The Tenth Annual Infrared Spectroscopy Institute will include four simultaneous five-day sessions as follows: 1) Elementary Theory and Interpretation of Spectra conducted by H. A. Szymanski, Canisius College; 2) Theory and Practice in Inorganic and Organometallic Infrared Spectroscopy, conducted by John Ferraro, Argonne National Laboratory; 3) Organic and biomedical Infrared Spectroscopy, conducted by Leopold May of the Catholic University of America; 4) Group Theory sessions, conducted by Joseph Ziomok, Martin-Marietta Company.

For further information on all three Institutes write to: Dr. H. A. Szymanski, Canisius College, 2001 Main St., Buffalo, New York 14208.
