## 54. The Temperature Coefficient of the Thermal Decomposition of Silver Oxalate.

By James Y. Macdonald.

Benton and Cunningham, studying the decomposition of silver oxalate ( $J$. Amer. Chem. Soc., 1935,57, 2227), claimed to have evidence that the energy of activation of the formation of nuclei was much greater than that of the rate of propagation of decomposition through the crystals. This would mean an increase in the temperature coefficient of the whole reaction at low temperatures, since its course would be governed by the relatively slow rate of formation of nuclei. At higher temperatures, the rate of spreading of decomposition from nuclei would become the " slow" reaction which would control the form of the reaction as a whole. The figure which they give, viz., 64,000 cals., is equivalent to a temperature coefficient of 11.0 in the range $80-110^{\circ}$, and in support of this they quote experiments in which they were unable to detect any reaction during $13 \frac{1}{2}$ hours at $80^{\circ}$. On the other hand, the author ( $J ., 1936,839$ ) showed that their calculation was erroneous, and found that the over-all temperature coefficient of the reaction was about $3 \cdot 0$, and that it was constant over the more limited range examined. Unfortunately, his experiments at the lowest temperature $\left(85^{\circ}\right)$ had to be curtailed for technical reasons, and were not considered
sufficiently trustworthy to quote. In order to settle the point, two complete runs have now been made at $80^{\circ}$, and these are compared below with runs with the same specimen at $110^{\circ}$ and $130^{\circ}$. It will be seen that all the characteristics of the reaction are maintained at the low temperature, and that a coefficient of about 3.0 was obtained, in agreement with the author's earlier results.

## Experimental.

The specimen used ( $R$ ) had been prepared about 1931 in complete darkness, and had never been exposed to light. The initial rate of decomposition was found to be rather high, in accordance with the assumption that slight decomposition had taken place at room temperature, and calculation showed that this was of the right order of magnitude for a temperature of $18^{\circ}$, a time of 5 years, and a coefficient of $\mathbf{3 . 0}$. The specimen had been prepared with an excess of sodium oxalate, and was therefore of the more unstable type. Its rate of decomposition was measured exactly as described by the author ( $\mathrm{J} ., 1936,832$ ), and the two runs at $80^{\circ}$ were conducted simultaneously, the same thermostat and the same vacuum backing being used.

In the following table, cols. 2-5 give the times (in mins.) talken by the various samples to attain the degree of decomposition given in col. 1. These figures were obtained by integrating the rate-time graphs, as already described (loc.cit.). Cols. 6 and 7 give, respectively, the temperature coefficient between $80^{\circ}$ and $110^{\circ}$ (the mean of the two experiments at $80^{\circ}$ being used) and that between $110^{\circ}$ and $130^{\circ}$. The coefficients are worked out for each percentage decomposition, and their constancy shows that the shape of the graphs is independent of temperature.

| Decomptn., \%. | $80^{\circ}$. | $80^{\circ}$. | $110^{\circ}$. | $130^{\circ}$. | Coeff., 80-110 ${ }^{\circ}$ | Coeff., 110-130 ${ }^{\circ}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 5 | 1850 | 1850 | $94 \cdot 0$ | $8 \cdot 0$ | $2 \cdot 70$ | $3 \cdot 42$ |
| 10 | 2500 | 2460 | $124 \cdot 1$ | $11 \cdot 1$ | $2 \cdot 71$ | $3 \cdot 34$ |
| 20 | 3360 | 3200 | 156.0 | $14 \cdot 5$ | $2 \cdot 76$ | $3 \cdot 27$ |
| 30 | 3660 | 3910 | $179 \cdot 0$ | 16.9 | $2 \cdot 76$ | $3 \cdot 28$ |
| 40 | 4070 | 4330 | $197 \cdot 6$ | $18 \cdot 4$ | $2 \cdot 76$ | $3 \cdot 26$ |
| 50 | 4430 | 4750 | 214.0 | $20 \cdot 4$ | $2 \cdot 78$ | $3 \cdot 24$ |
| 60 | 4850 | 5210 | $231 \cdot 0$ | $22 \cdot 0$ | $2 \cdot 79$ | $3 \cdot 24$ |
| 70 | 5350 | 5710 | $249 \cdot 8$ | $23 \cdot 9$ | $2 \cdot 81$ | $3 \cdot 22$ |
| 80 | 5910 | 6300 | $270 \cdot 5$ | $26 \cdot 0$ | $2 \cdot 83$ | $3 \cdot 22$ |
| 90 | 6660 | 7090 | 303.0 | $29 \cdot 7$ | $2 \cdot 83$ | $3 \cdot 19$ |
|  |  |  |  |  | Mean 2.77 | $3 \cdot 27$ |

The second table gives the values of $a$ and $p$ in the equation $d x / d t=a e^{p t}[l o c . c i t .$, p. 843, equation (3)], and these may be compared with the values for other specimens given in that paper. In the present case, the figures are not very reliable, because the logarithmic graphs from which they are obtained show considerable curvature.

|  |  | $80^{\circ}$. | $110^{\circ}$. | $130^{\circ}$. | Coeff. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $a \times 10^{6}$ | $\ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots$. | $0 \cdot 358$ | $11 \cdot 0$ | $90 \cdot 8$ | $3 \cdot 03$ |
| $p \times 10^{4}$ | $\ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots$ | 0.0987 | 1.82 | $20 \cdot 6$ | 2.87 |
