21. Syntheses in the Naphthalene Series. Part II. 3-Hydroxy-2-alkyl-1: 4-naphthaquinones.

By Gabra Soliman and (in part) Albert Latif.

A new method for the synthesis of 3-hydroxy-2-alkyl-1:4-naphthaquinones is described in which 2-alkyl-1:3-dihydroxynaphthalenes are oxidised with atmospheric oxygen in presence of alcoholic potassium hydroxide.

ALKYLATED 1: 4-naphthaquinones have recently been the subject of considerable study. These include phthiocol (I), the yellow pigment of human tubercle bacillus, which has recently been shown to possess vitamin-K activity (Almquist and Klose, J. Amer. Chem. Soc., 1939, 61, 2557), and dihydrolapachol (III), the reduction product of lapachol (III) occurring in Lapacho wood (Bignoniaceæ) (Paternò, Gazzetta, 1879, 9, 505) and Bethabarra wood (Greene and Hooker, J. Amer. Chem. Soc., 1889, 11, 267).

 (II.)
$$\begin{array}{c} O \\ C \\ C \\ O \\ \end{array}$$
 (III.)
$$\begin{array}{c} O \\ C \\ O \\ O \\ \end{array}$$

The published syntheses of phthiocol and dihydrolapachol (Madinaveitia, Anal. Fis. Quim., 1933, 31, 750; Anderson and Newmann, J. Biol Chem., 1933, 103, 405; 1934, 105, 279; Monti, Gazzetta, 1915, 45, 51; Hooker.

56

J. Amer. Chem. Soc., 1936, 58, 1163) leave much to be desired. They are, however, readily prepared by a method, first recorded by one of us (Soliman) in an M.Sc. thesis in 1931, which involves oxidation of a 2-alkyl-1:3-dihydroxynaphthalene by atmospheric oxygen in presence of alcoholic potassium hydroxide. This process gave phthiocol in almost quantitative yield. Similarly, 1:3-dihydroxynaphthalene was converted into 2hydroxy-1: 4-naphthaquinone, and the ethyl, propyl, isopropyl, butyl, isobutyl, and isoamyl homologues were prepared from the corresponding 1: 3-dihydroxynaphthalenes, with melting points somewhat higher than those recorded in the literature (cf. Hooker, J. Amer. Chem. Soc., 1936, 58, 1163; Hooker and Steyermark, ibid., p. 1168).

Koelsch and Byers (J. Amer. Chem. Soc., 1940, 62, 560) found that 2-ethyl- and 2-butyl-3-carbethoxy-1: 4naphthaquinone gave, on treatment with air and warm dilute sodium hydroxide solution, the corresponding 3-hydroxyquinones. This reaction involves hydrolysis of the ester group and decarboxylation prior to hydroxylation in position 3, whereas, in the reaction now described, hydroxylation involves carbon atom 4:

$$(IV.) \xrightarrow{OH} OH OH R$$

$$OH OH OH R$$

$$(VI.) (VI.) (VI.)$$

3-Hydroxy-2-phenyl-1: 4-naphthaquinone (Gheorgiu and Radulescu, Ber., 1927, 60, 186) has also been obtained by the general reaction, and by Volhard (Annalen, 1897, 296, 14) from 1:3-dihydroxy-2-phenylnaphthalene by treatment with dilute sodium hydroxide solution, and this indicates that the reaction now described may be successfully applied to aromatic derivatives.

EXPERIMENTAL.

2-Hydroxy-1: 4-naphthaquinone.—When a solution of 1: 3-dihydroxynaphthalene (3.5 g.) in alcohol (10 c.c.) and 5% alcoholic potassium hydroxide (30 c.c.) was exposed to air for 2 days, a red crystalline potassium salt separated. dissolved freely in water, and on acidification gave a yellowish precipitate which crystallised from benzene in plates,

dissolved freely in water, and on acidification gave a yellowish precipitate which crystallised from benzene in plates, m. p. 192°, identical with an authentic specimen (Found: C, 69·0; H, 3·5. Calc. for C₁₀H₆O₃: C, 69·0; H, 3·5%).

3-Hydroxy-2-alkyl-1: 4-naphthaquinones.—The following homologues were prepared by the method described above and crystallised from dilute methanol: 2-Methyl-, canary-yellow needles, m. p. 174° (Found: C, 70·0; H, 4·3. Calc. for C₁₁H₈O₃: C, 70·1; H, 4·3%); acetate (acetic anhydride and sodium acetate), yellowish needles, m. p. 108°, from methanol (Found: C, 67·7; H, 4·4. Calc.: C, 67·8; H, 4·4%). 2-Ethyl-, yellow needles, m. p. 141° (Found: C, 71·2; H, 5·0. Calc.: C, 71·3; H, 5·0%); acetate (acetic anhydride and pyridine), needles, m. p. 91°, from methanol (Found: C, 68·8; H, 4·9. Calc.: C, 68·9; H, 4·9%). 2-Propyl-, plates, m. p. 103—104° (Found: C, 72·2; H, 5·6%); acetate, plates, m. p. 52° (Found: C, 69·6; H, 5·7. Calc.: C, 69·7; H, 5·5%). 2-iso-Propyl-, plates, m. p. 95° (Found: C, 72·2; H, 5·6. Calc.: C, 72·2; H, 5·6%). 2-Butyl-, needles, m. p. 101—102° (Found: C, 73·1; H, 5·9%). Calc.: C, 73·0; H, 6·1%). 2-isoButyl-, prisms, m. p. 134° (Found: C, 73·1; H, 6·1. Calc.: C, 73·0; H, 6·1%). 3-eetate, needles, m. p. 53° (Found: C, 70·5; H, 5·8. Calc.: C, 70·5; H, 5·9%). 2-iso-Amyl- (dihydrolapachol), yellow plates, m. p. 94° (Found: C, 73·8; H, 6·4. Calc.: C, 73·7; H, 6·6%); acetate, needles, m. p. 76—77°, from light petroleum. When dihydrolapachol (0·4 g.) was heated with zinc dust (0·5 g.) and acetic anhydride (15 c.c.) for 3 hours, the triacetate corresponding to the quinol was obtained; it crystallised from dilute methanol in needles, m. p. 120° (Monti, loc. cit., gives m. p. 110—112°).

3-Hydroxy-2-phenyl-1: 4-naphthaquinone, obtained in almost quantitative yield when 2-phenyl-1: 3-dihydroxy-

3-Hydroxy-2-phenyl-1: 4-naphthaquinone, obtained in almost quantitative yield when 2-phenyl-1: 3-dihydroxynaphthalene was subjected to the same process of oxidation, crystallised from methanol in orange needles, m. p. 147°

(cf. Volhard, loc. cit.).
