SYMBOLS FOR THERMODYNAMICAL AND PHYSICO-CHEMICAL QUANTITIES AND CONVENTIONS RELATING TO THEIR USE, ADOPTED AS RECOMMENDED PRACTICE BY THE CHEMICAL SOCIETY.

(Where two or more symbols separated by commas or semicolons are given for a quantity, these symbols are to be regarded as alternatives for which no preference is expressed. On the other hand, where two symbols are separated by a dotted line, the former is the first preference.)

1. To be Printed in Black Italic.

(Certain important physical constants.)

- F Faraday's constant.
- J Mechanical equivalent of heat.
- N Avogadro's number.
- R {Gas constant per mol. Rydberg's constant.
- c Velocity of light in vacuo.
- e Electronic charge (charge equal and opposite in sign to that of an electron).
- **g** Acceleration due to gravity (standard value, if variation from standard is significant).
- h Planck's constant.
- k Boltzmann's constant.
- m Rest mass of an electron.

2. To be Printed in Ordinary Italic, when not Greek.

(b) Examples of single-letter abbreviations.

*Ampère	(in su	ıb-uni	its)	•			•		a.
Volt	•		•	•	•	•	•		v.
Ohm	•		•	•	•	•		•	Ω .
Watt	•								w.
Farad	•		•	•	•	•	•	•	F.
Henry	•		•	•	•		•	•	H.
Centigrad									c.
Fahrenhe	it		•	•	•	•	•		F.
Kelvin	•	•			•		•		ĸ.
Ångstron	n unit		•	•	•				Ą.
micron	•	•	•	•	•	•	•	•	μ.
metre	•	•	•	•	•	•	•	•	m.
gram				•			•		g.
litre	•	•	•	•	•	•	•	•	I.
Röntgen	unit						•		r.
†Normal				•	•				N.
†Molar (c	oncen	tratio	n)	•	•	•	•	•	М.

The following prefixes to abbreviations for the names of units should be used to indicate the specified multiples or sub-multiples of these units:

M	mega-	$10^6 \times$
k	kilo-	$10^3 \times$
d	deci-	$10^{-1} \times$
c	centi-	$10^{-2} \times$
m	milli-	$10^{-3} \times$
μ	micro-	$10^{-6} \times$

e.g., M Ω . denotes megohm; kw., kilowatt; and µg., microgram. The use of µµ. instead of mµ. to denote 10^{-7} cm., or of γ to denote microgram is deprecated.

4. Subscripts and other Modifying Signs.

(a) Subscribts to symbols for quantities

	(a) Subscripts to symbols for quantities.
I, II 1, 2 A B . i	sespecially with symbols for thermodynamic functions, referring to different systems or different states of a system. referring to molecular species A, B, etc. referring to a typical ionic species i. referring to an undissociated molecule.
+,	referring to a positive or negative ion, or to a positive or negative electrode.
p, v, T	indicating constant pressure, volume, and temperature respectively.
q	indicating adiabatic conditions.
v	indicating that no work is performed.
p, c, a	with symbol for an equilibrium constant, indicating that it is expressed in terms of pressure, concentration, or activity.
G, V, L, X	referring to gas, vapour, liquid, and crystalline states, respectively.
f, e, s, t, d	referring to fusion, evaporation (vaporisation of liquid), sublimation, transition, and dissolution or dilution respectively.
o	referring to the critical state or indicating a critical value.
0	referring to a standard state, or indicating limiting value at infinite dilution.

^{*} E.g. "ma." for "milliampère"; but "amp." is preferred for "ampère."
† Separated by a hyphen (and no full stop) from a chemical formula which follows it.

with symbols for optical properties, referring to a particular wavelength.

Where a subscript has to be added to a symbol which already carries a subscript, the two subscripts may be separated by a comma or the symbol with the first subscript may be enclosed in parentheses with the second subscript outside.

(b) Other modifying signs.

- o as right-hand superscript to symbol (particularly to a symbol for a general thermodynamic function—see p. 718), referring to a standard state.
- [] enclosing formula of chemical substance, indicating its molar concentration.
- { } enclosing formula of chemical substance, indicating its molar activity.

In crystallography it is recommended that:

Millerian indices be enclosed in parentheses, ();

Laue indices be unenclosed;

Indices of a plane family be enclosed in braces, { };

Indices of a zone axis or line be enclosed in brackets, [].

Numerals attached to a symbol for a chemical element in various positions have the following meanings:

```
upper l ft mass number of atom. lower left nuclear charge of atom.
```

lower right number of atoms in molecule.

e.g., ${}_{2}^{7}\text{Li}$; ${}_{1}^{2}\text{H}_{2}$ (= D_{2}).

ALPHABETICAL INDEX OF RECOMMENDED SYMBOLS, and single-letter abbreviations.

including all those given in the above lists except prefixes, subscripts and other modifying signs.

The name of any quantity for which a given symbol is a second preference is printed in parentheses.

```
A free energy—Helmholtz; atomic weight; surface area.
```

A. Ångstrom unit.

a activity; (acceleration).

- a. ampère, in sub-units-see footnote, p. 988.
- B magnetic induction.
- C concentration; electrostatic capacity. with subscript: molecular heat capacity.
- c. Centigrade.
- c velocity of light in vacuo.
- c velocity; concentration.

 with subscript: specific heat.
- D diffusion coefficient.
- d diameter; distance; (density).
- d differential.
- artial differential.
- E energy; (intrinsic energy); potential difference, especially electromotive force of voltaic cells.
- with subscript: single electrode potential.
 electronic charge—charge equal and opposite in sign to that of an electron.
 quantity of electricity, especially electrostatic charge.
 with subscript: single electrode potential.

```
е
    base of natural logarithms.
F
    Faraday's constant.
F
    force; (free energy—Helmholtz).
    farad; Fahrenheit.
F.
    acceleration; activity coefficient, for molar concentration; partition
f
      function.
f
    function.
G
    thermodynamic potential, Gibbs function, free energy—G. N. Lewis.
    acceleration due to gravity, standard value.
\boldsymbol{g}
    acceleration due to gravity, as a variable; osmotic coefficient.
g
g.
Η
    enthalpy, total heat, heat content; magnetic field strength.
H.
    henry.
    Planck's constant.
h
h
    height.
I
    moment of inertia; ionic strength; electric current; intensity of light.
    vapour pressure constant; van 't Hoff's factor.
J
    mechanical equivalent of heat.
J
K
    gram-equivalent weight.
    chemical equilibrium constant; (compressibility).
    K, solubility product.
ĸ.
    Kelvin.
    Boltzmann's constant.
k
    thermal conductivity; velocity constant of chemical reaction.
k
L
    latent heat per mol; self inductance; (solubility product).
    latent heat per g.; length; mean free path of molecules.
    with subscript: equivalent ionic conductance, "mobility".
1.
    litre.
M
    molecular weight; mutual inductance; magnetic moment.
    molar concentration.
m rest mass of an electron.
m
   mass.
m. metre.
    Avogadro's number.
N
N mol fraction.
N. normal concentration.
    number of mols.
    with subscript: (transport number).
    with subscript: refractive index.
P
    pressure.
[P] parachor.
    pressure.
Q
    quantity of electricity.
    heat entering a system.
R
    gas constant per mol; Rydberg's constant.
    electrical resistance.
R
[R] with subscript: molecular refraction.
    radius; (specific resistance).
    with subscript: specific refraction.
r.
    Röntgen unit.
S
    entropy.
    solubility; (surface area).
T
    temperature, on absolute Kelvin scale.
    with subscript: transport number.
    time; (temperature—not on absolute scale).
U
    intrinsic energy.
    velocity component.
    with subscript: velocity of ions.
```

volume; potential, potential difference, including Volta potential.

- v. volt.
- v volume; velocity; velocity component.
- W (work done by or on a system).
- w. watt.
- w work done by or on a system; velocity component.
- X force component; potential gradient in electric field.
- x mol fraction.
- Y force component.
- Z force component; g.-equivalent weight; number of molecular collisions per second; atomic number.
- z valency of an ion.
- a degree of electrolytic dissociation; angle of optical rotation.
- [a] specific optical rotation.
- Γ surface concentration excess.
- γ ratio of specific heats; surface tension.
- Δ increment.
- δ very small increment.
- ϵ dielectric constant; molar extinction coefficient.
- ζ electrokinetic potential.
- η efficiency of any process; viscosity; electrolytic polarisation, overvoltage.
- $\dot{\theta}$ angle of contact; temperature—not on absolute scale.
- κ compressibility; specific conductance; magnetic susceptibility—volume.
- Λ equivalent conductance.
- λ wave length.
- μ chemical potential; dipole moment; magnetic permeability.
 with subscript: (refractive index).
- μ. micron.
- v frequency; wave number.
- Π pressure, especially osmotic pressure.
- II product.
- π (electrolytic polarisation, overvoltage).
- π ratio of circumference to diameter.
- ρ density; specific resistance.
- Σ sum.
- σ diameter of molecules; (surface tension); (specific conductance).
- τ time interval, especially half or mean life.
- 6 fluidity; electronic exit work function; magnetic flux.
- φ function.
- χ magnetic susceptibility—mass.
- $\dot{\boldsymbol{\psi}}$ wave function.
- $\hat{\Omega}$. ohm.
- ω angular velocity; specific magnetic rotation.
