## 711. Some $\alpha \omega$-Di(phenanthridin-6-yl)alkanes.

By B. L. Hollingsworth and V. Petrow.
The preparation of some $N N^{\prime}$-di-(2-biphenylyl)alkylenediamines and their cyclisation to the corresponding $\alpha \omega$-di(phenanthridin-6-yl)alkanes are described.

Some $\alpha \omega$-di(phenanthridin-6-yl)alkanes, which are structurally similar to emetine and were required for biological study as possible amœbicides, have been prepared.

Morgan and Walls ${ }^{1}$ prepared 6 -substituted phenanthridines by cyclisation of 2 -acylamidobiphenyls with phosphorus oxychloride. Ritchie ${ }^{2}$ extended this method to $N N^{\prime}$-di-(2-biphenylyl)adipamide (I; $n=4$ ) obtaining 1,4-di(phenanthridin-6-yl)butane (II; $n=4$ ) in low yield, together with a second, unidentified compound. We now find that, when ring closure is effected by phosphorus oxychloride in nitrobenzene, $\mathbf{1 , 4}$-di-(phenanthridin-6-yl)butane is formed in $50 \%$ yield, without the second compound described by Ritchie. ${ }^{2}$ The pentane, hexane, heptane, octane, and decane compounds (II; $n=5-8,10$ ) have now been prepared similarly in $55-80 \%$ yield, but the glutaramide derivative ( $\mathrm{I} ; n=3$ ) resisted attempts at ring closure, even under experimental conditions that led to extensive resinification (cf. Ritchie ${ }^{2}$ ).

Attempts to prepare amino-derivatives of compounds (II) by extending the ring closure to nitro-derivative of adipamide ( $\mathrm{I} ; n=4$ ) failed. This was not entirely unexpected, as Walls ${ }^{3}$ had shown that cyclisation of 2 -acetamido- $4^{\prime}$-nitrobiphenyl gives only a negligible yield of 6-methyl-8-nitrophenanthridine, presumably owing to the deactivating influence of the nitro-substituent. Aminophenanthridines were later prepared by Petrow ${ }^{4}$ and by Walls ${ }^{5}$ by reducing 2 -acylamido-nitrobiphenyls and protecting the amino-group by benzoylation or by ethoxycarbonylation before cyclisation.

[^0]Accordingly the 5 -nitro-2-biphenylyl-amide was reduced and benzoylated, but this product and its $4^{\prime}$-benzamido-isomer resisted cyclisation by phosphorus oxychloride alone or in mitrobenzene. The desired ring closures were achieved, however, by using the 5 and the $4^{\prime}$-ethoxycarbonylamino-derivatives.

The di(phenanthridin-6-yl)alkanes (II) are fairly high-melting, rather insoluble compounds, readily form quaternary salts and picrates, and exhibit the characteristic phenanthridine blue fluorescence in sulphuric acid. The quaternary salts are somewhat unstable in solution and have no biological activity.

1,4-Di(phenanthridin-6-yl)butane has slight action against Entamoeba histolytica in vivo and in vitro.

## Experimental

The following acid chlorides were prepared by refluxing the acids with an excess of thionyl chloride in benzene and were repeatedly distilled under reduced pressure: glutaroyl, b. p. $103-104^{\circ} / 11 \mathrm{~mm} ., n_{\mathrm{D}}^{20} 1 \cdot 47178$, adipoyl, b. p. $118-119^{\circ} / 12 \mathrm{~mm}$., $n_{\mathrm{D}}{ }^{20} 1 \cdot 47172$, pimeloyl, b. p. $135-136^{\circ} / 11 \mathrm{~mm} ., n_{\mathrm{D}}{ }^{20.5} 1 \cdot 47005$, suberoyl, b. p. $147-148^{\circ} / 11 \mathrm{~mm}$., $n_{\mathrm{D}}{ }^{20.5} 1 \cdot 46923$, azeloyl, b. p. $158-159^{\circ} / 12 \mathrm{~mm} ., n_{\mathrm{D}}{ }^{20} 1 \cdot 46749$, sebacoyl, b. p. $168-169^{\circ} / 12 \mathrm{~mm} ., n_{\mathrm{D}}{ }^{20} 1 \cdot 46864$, and dodecanedioyl dichloride, b. p. 192-193 $/ 11 \mathrm{~mm}$., $n_{\mathrm{D}}{ }^{20 \cdot 5} 1 \cdot 46814$.
$\mathrm{NN}^{\prime}$-Di-(2-biphenylyl)adipamide.-2-Aminobiphenyl ( 17.75 g .), adipoyl dichloride ( 9.2 g. ), and dry benzene ( 70 ml .) were gently refluxed until evolution of hydrogen chloride had ceased ( $\sim 3 \mathrm{hr}$.). The products were made alkaline with aqueous ammonia and again refluxed for a short time. The solution was evaporated to dryness, and the solid obtained was suspended in $50 \%$ aqueous alcohol and refluxed for 15 min . After cooling, the precipitated solid was collected. It formed needles (from ethanol), m. p. 174-175 (Found: C, 80.3; H, 6.3; N, 6.5. Calc. for $\mathrm{C}_{30} \mathrm{H}_{28} \mathrm{~N}_{2} \mathrm{O}_{2}: \mathrm{C}, \mathbf{8 0 . 3} ; \mathrm{H}, 6.3 ; \mathrm{N}, 6.3 \%$ ) (yield $95 \%$ ). Ritchie ${ }^{2}$ gives m. p. $171^{\circ}$.

The compounds in Table 1 were prepared similarly. The following notes apply:
No. 1: Ritchie gives m. p. $162^{\circ}$.
No. 7: This was prepared from adipoyl dichloride and 2 -amino-4-methylbiphenyl ${ }^{6}$ in toluene.
No. 8: This was prepared from 2 -amino- 4 -chlorobiphenyl ${ }^{6}$ in toluene.
No. 12: This was prepared from the $4^{\prime}$-nitro-compound by use of reduced iron in aqueous ethanol.

No. 13: An identical compound was prepared by reaction of adipoyl dichloride with 2 -amino-$4^{\prime}$-ethoxycarbonylaminobiphenyl ${ }^{6}$ in benzene.

No. 14: This was prepared by reaction of adipoyl dichloride with 2 -amino- $4^{\prime}$-benzamidobiphenyl ${ }^{6}$ in chlorobenzene, and by benzoylation (Schotten-Baumann) of No. 12.

No. 16: This was prepared from the 5 -nitro-compound by use of reduced iron in aqueous ethanol.

1,4-Di(phenanthridin-6-yl)butane.-The amide ( $\mathrm{I} ; n=4$ ) ( 30 g.$)$, dry nitrobenzene ( 100 ml .), and phosphorus oxychloride ( 36 ml .) were heated at $180^{\circ}$ until evolution of hydrogen chloride, which at first was vigorous, had practically ceased ( $\sim 1 \mathrm{hr}$.). The cooled product was poured on ice ( 300 g .) and neutralised with aqueous ammonia. The collected solid was heated in $50 \%$ aqueous alcohol for 30 min . The solid residue was collected and crystallised from pyridine. 1,4-Di(phenanthridin-6-yl)butane formed very pale yellow needles, m. p. 215 (Found: C, 86.8; $\mathrm{H}, 5 \cdot 8 ; \mathrm{N}, 6.7$. Calc. for $\mathrm{C}_{30} \mathrm{H}_{24} \mathrm{~N}_{2}$ : C, $87.4 ; \mathrm{H}, 5 \cdot 7 ; \mathrm{N}, 6.8 \%$ ) (yield $50 \%$ ). Ritchie ${ }^{2}$ gives $\mathrm{m} . \mathrm{p} .214^{\circ}$. It is soluble in pyridine, nitrobenzene, and glacial acetic acid, but only sparingly soluble in other organic solvents.

The dimethosulphate, white needles, m. p. $287^{\circ}$ (decomp.) (Found: S, $9 \cdot 6 . \quad \mathrm{C}_{34} \mathrm{H}_{36} \mathrm{~N}_{2} \mathrm{O}_{8} \mathrm{~S}_{2}$

- Hollingsworth and Petrow, J., in the press.

requires $S, 9.6 \%$ ) after crystallisation from aqueous alcohol, was prepared by use dimethyl sulphate in nearly boiling nitrobenzene (yield $80 \%$ ). With aqueous potassium iodide it gave the yellow dimethiodide ( $95 \%$ ), m. p. $278-280^{\circ}$ (decomp.) [from alcohol-light petroleum (b. p. 80- $100^{\circ}$ )] (Found: I, $\mathbf{3 6 \cdot 1 .} \quad \mathrm{C}_{30} \mathrm{H}_{24} \mathrm{~N}_{2}, 2 \mathrm{CH}_{3} \mathrm{I}$ requires I, $\mathbf{3 6} \cdot 5 \%$ ). On repeated recrystallisation this formed the monomethiodide, also yellow, m. p. 274 ${ }^{\circ}$ (decomp.) (Found: I, 23.2. $\mathrm{C}_{30} \mathrm{H}_{24} \mathrm{~N}_{2}, \mathrm{CH}_{3} \mathrm{I}$ requires $\mathrm{I}, 22.9 \%$ ), that with wet silver chloride in boiling absolute alcohol gave the white monomethochloride, needles ( $60 \%$ ) (from alcohol-ether), m. p. $228-229^{\circ}$ (decomp.) (Found: $\mathrm{Cl}, 7 \cdot 5 . \quad \mathrm{C}_{30} \mathrm{H}_{24} \mathrm{~N}_{2}, \mathrm{CH}_{3} \mathrm{Cl}$ requires $\mathrm{Cl}, 7 \cdot 7 \%$ ).

1,5-Di(phenanthridin-6-yl)pentane di-isethionate, white prisms (from alcohol-acetone), m. p. 173- $174^{\circ}$ (Found: S, 9.3. $\mathrm{C}_{35} \mathrm{H}_{38} \mathrm{~N}_{2} \mathrm{O}_{8} \mathrm{~S}_{2}$ requires $\mathrm{S}, 9 \cdot 4 \%$ ), was obtained ( $70 \%$ ) by treating the base with isethionic acid in boiling alcohol: it was easily soluble in alcohol and water, but practically insoluble in non-ionic solvents.

The compounds in Table 2 were prepared similarly. Compound 10 was recovered unchanged after 5 hours' refluxing in fuming hydrochloric acid, and after 2 hours' in $70 \%$ sulphuric acid at: $150^{\circ}$.

This work was commenced at Queen Mary College (University of London), during the period 1946-1948.
